---

THE volume of this work for 1882 is the seventh of the new series and the twenty-second of the whole series. It has grown in size to meet the rapidly increasing activity in human affairs, and to present the interesting public questions and scientific developments which have arisen, and the discussions of their principles.

A special article is devoted to each State of the United States and generally to each country of the world, which contains a sketch of its history during the year, the administration of its government, and its legislation; full and official information is given of its area, population, education, military and naval force, commerce, finances, productions, statistics, public men, and the public questions agitated, and reforms effected. No efforts are spared to secure the fullest information from all parts of the world, and it is considered that in its several departments the work may be safely consulted as the completest and most reliable book of reference. At the same time its record of progress in the various departments of science and useful practical knowledge will be found most valuable and unsurpassed.

In this volume are fully presented the details on the great question agitating the country, "The Protection of American Industry," in the "Debates of Congress"; the "Tariff Revision Commission"; an analysis of the "Manufactures of the United States"; the "Occupations of the Various Classes of Population as shown by the Census"; the revenues from taxation and the duties on imports, as shown in the "Finances of the United States," by Russel A. Bayley, of the Treasury Department, which contains results not before put in print. Also the articles "on the Commerce and Finances" of the country; the revival of "The Merchant Marine Service," with others valuable and important, bear upon the same subject.

The reports of the census, showing the marvelous strides of the country, are collated in articles on the "Cereal and Coal Products"; the "Cotton Crop and its Special Manufactures"; the "Farms and Live-Stock" of the country; the vast extent of the "Fisheries of the Coast-line States"; "Forestry and the Question of the Conservation of the Forests"; the results of the "Investigation of the Lung-Plague in Cattle"; statistics of "Education and Illiteracy," to which is added the educational measures in European nations; "Details of the Criminal Jurisprudence of the States"; the "Railroads," the "Telegraphs," and the "Telephones" of the United States; the "Indebtedness of the United States," "National," "State," "County," and "Municipal," and the "Public Debts of

the Various Countries of the World." This article is illustrated by numerous engravings, showing the relative magnitude of these debts, and by colored maps of the relative indebtedness of different sections of the country.

The "Recent Progress of the States" is fully noted, and that especially of Georgia, North Carolina, South Carolina, Tennessee, Texas, Mississippi, and Louisiana, receives particular attention in articles prepared from official and original documents by Professor W. M. Browne, of Georgia. Other subjects of a public nature are presented under "Labor Movements and Agitations"; decisions of questions of constitutional law, under "Obligation of State Contracts"; "Suits against a State"; "Railroad Taxation"; "Chinese Immigration"; the surprising "Political Revolution of the Year," with its results, is set forth under "New York" and "United States."

The stirring events in some foreign countries have been of unusual interest; as the "Irresistible British Campaign in Egypt," which is authoritatively narrated, with illustrations; the "Irish Question"; the "Clôture in England"; the "Struggle of Bismarck with the Reichstag"; the "Austrian Campaign in Herzegovina." The recent views on "Non-Intervention among Nations," in opposition to that intervention which is an endless cause of wars, and the "Disciplinary Power of Legislative Assemblies," both by the editor of the "whole series" of these volumes, discuss some most vital principles. An illustrated article on the "Navies of Europe" affords a complete understanding of their immense power, and of the principal naval question of the age—the contest between plated armor and heavy guns. The recent "Italian Experiments at Spezia" are reported with illustrations.

Of the long list of special articles and new subjects may be mentioned, "The Sanitary Control of Epidemic Diseases," illustrating the experience with the yellow fever in Texas during the year, by Dr. John B. Hamilton. It is the first formal article on the subject which has appeared in print, and will serve as a guide to municipal health in all the States and cities of the Union; the "Progress made in Electric Lighting"; the "Storage of Electric Energy"; "Sewage Disposal"; "Astronomy," by Professor Daniel Kirkwood, of Indiana; "Physiology"; "Metallurgy"; "Egyptological and Assyriological Research," its results to the present time; the "Manufacture of Oleomargarine"; "Operations in Ostrich-Farming"; the "Harvests of the World" for 1882, etc. The record of Literature and Literary Progress in this country and those of Europe is extensive as usual.

The great Engineering enterprises of the world are specially described. Articles on the great religious divisions and denominations present the religious history of the year. Biographical notices of eminent persons of all countries are included in these pages.

Fine steel portraits of Chief-Justice Waite, Sir Garnet Wolseley, the conqueror of Egypt, and Sir John A. Macdonald, the Canadian premier, illustrate the volume, together with smaller portraits of prominent men of the year, including the members of the President's Cabinet, with maps and diagrams.

# THE ANNUAL CYCLOPÆDIA.

---

## A

**AGRICULTURE, DECLINE OF, IN ENGLAND.** From various sources the fact has become apparent that agriculture in England has of late years suffered a great, almost alarming decline. The whole subject is occupying the attention of the public, and numerous publications of interest have appeared, in which are investigated the various phases of this decline during the last fifteen or twenty years, and a searching inquiry is made into the state and prospects of English agriculture at the present, as well as what may reasonably be looked for in the immediate future.

**BAD SEASONS.**—The chief occasion of present suffering is the succession of bad seasons, the loss from which has been summed up in figures absolutely appalling. And further, the uneasy, restless condition of mind with masses of the people urges the search for a deeper source of the evil, e. g., in the social and legal relations between the owner and the cultivator of the land. But, without entering into that question here, it is clear that *extreme* remedies (urged by some) are to be deprecated, and the facts are fairly and calmly to be examined into, seeing that the land-owner, the farmer, and the laborer have really a common interest in every measure which will tend to draw the most produce out of the land for their own profit and the good of the whole community. "High farming" (as it is called), which implies the importation of material from without, is not found to yield any sufficient remedy. Its expense has, hardly without exception, been found to be greater than its returns. A marked improvement in the wages of domestic servants has had the effect of drawing away numbers of the daughters of laborers from field-work, and the complaint is freely made that juvenile labor is much decreased by the longer attendance at school, and the ill results of much which children learn there, in rendering them dissatisfied with house-work and farm-labor.

**AMERICAN COMPETITION.**—American competition, too, has had a most depressing effect upon agricultural interests in England. The wheat-crop in the United States has grown during the twenty years just past from twenty to sixty million quarters. Exports from America of meat, cheese, and butter have also largely increased. Some comfort, however—such as it is—may be drawn from the consideration that Manitoba, a rising and important part of the British possessions in America, promises to exceed in fertility all the wheat-growing countries in the world. During the past fourteen years it appears that the United Kingdom has obtained from abroad about one half the amount of its consumption of wheat. "It is clear," says an English writer, "that, however much we may deplore the losses from bad seasons, the extension of tillage throughout the world has not kept pace with the needs of our population; and the new railways and waterways abroad may not prove more injurious to English farmers, in the face of an increasing population, than the extension of roads in England was to the farmers of Middlesex, who petitioned Parliament, in the last century, against the opening up of remote districts which, they said, could undersell them, owing to the cheapness of their lands." Wheat growing is not regarded by good authorities as of first-rate importance in English home-farming; \* on the contrary, live-stock seems to have become the paramount interest in agriculture.

**STATISTICS.**—The London "Times" furnishes some very valuable as well as instructive statistics on this subject, especially with reference to the question of live-stock in farming. There is, it appears, a very great curtailing, almost relinquishing, of the breeding or fattening of

\* Of the whole cultivated area of the United Kingdom (about 48,000,000 acres) the grain-crops occupy only 22½ per cent (6 per cent only being wheat, 5½ barley, and 9 oats), the green crops, clover, etc., and permanent pasture occupying the remaining 77½ per cent.

animals, notwithstanding that sheep are selling for one shilling per pound in their wool, and no farmer can possibly have exchanged breeding and grazing for the cultivation of wheat. Is this prostration of husbandry, it is asked, typical of a general degradation of farmers' resources? And has the process of depletion begun only in the last few seasons, or has it been operative for a decade of years or more?

On comparing the stock of sheep in 1881 with that in 1868, a tolerably clear view is obtained of the loss during those thirteen years. There is not a single county in England without a diminution, more or less large, in the amount of sheep-stock. In England there are not three fourths as many sheep as there were in 1868, the decrease being 5,548,000. The loss for Wales is 201,000 sheep, or  $7\frac{1}{2}$  per cent; for Scotland, 381,000, or  $5\frac{1}{4}$  per cent; for Great Britain, the reduction is 6,130,000, or about 20 per cent; for Ireland, 1,564,000, or  $32\frac{1}{4}$  per cent; and for the United Kingdom, a loss of 7,712,000, or  $21\frac{3}{8}$  per cent. The augmentation of cattle-stock does not at all counterbalance this great decrease in sheep-stock. While sheep diminished in England, in thirteen years,  $26\frac{1}{2}$  per cent, cattle increased only 10 per cent, and in the United Kingdom only 9 per cent.

In the tables furnished, a comparison is instituted between cattle and sheep stock, by estimating each head of cattle as equivalent to six sheep; and in this way an approximation is made, as nearly as possible, to the true deficit with live-stock in the United Kingdom. From this it appears that the total combined cattle and sheep stock of England in 1881 was less than that of 1868 by a head of live-stock equivalent to 3,268,000 sheep, being a reduction of  $7\frac{1}{4}$  per cent. Put at £2.10 per sheep, the money loss is £8,170,000 (over \$40,000,000). The decrease for Great Britain was 5 per cent; but, owing to some increase in Wales and Ireland, it was for the United Kingdom 3 per cent. This is, it must be confessed, a rather sad position of affairs, after all the expense and toil incurred in the application of improved methods of husbandry. Another table gives the acres in the different counties under permanent pasture, as clover, grasses, green crops, etc., showing an increase of over 15 per cent in England, and over 10 per cent in the United Kingdom.\* This increase in permanent pasture has diminished a large breadth of the area devoted to wheat. Hence, while England has probably £8,000,000 less farmers' capital in live-stock, it has a further £4,000,000 loss in wheat-crops than it possessed fourteen years ago. The fact, too, is to be faced that there is now a much lighter stocking per acre in England of animal food-crops, as compared with 1868, and this is corrected to only a small extent by the reduced acreage of straw-

crops. The decline in the stock upon grass and forage crops in England is 20 per cent, in Wales 15 per cent, in Scotland 12 per cent, though in Ireland it is less than 2 per cent. Farmers, no doubt, would have multiplied their head of stock had they been able to do so; but apparently invincible obstacles stood in their way. The great drought of 1868, succeeded quickly by another hot summer in 1870, and this immediately followed by two years of great prevalence of foot-and-mouth disease, brought the herds and flocks very low, except in Wales and in Ireland, and not to such an extent in Scotland as in England. A maximum head of stock was attained in 1874 and 1875; then came a decline, partially recovered at the June census of 1879. But since then the fall in numbers has been rapid, sheep-rot and cattle-diseases having made excessive ravages, while the last three or four years' failing wheat-crops destroyed a serious proportion of the capital which would have been otherwise available for raising animal produce. The decrease in breeding, too, has been remarkable, amounting to 2,136,000 lambs less in 1881 than was bred in 1868, i. e., about 27 per cent. The increase of 116,000 calves does not compensate for the decrease of lambs, since this number of calves is equivalent only to an addition of 696,000 against a loss of 2,136,000. On a comparison of small with large holdings—that is, farms of 50 and 100 acres and less, compared with those of 1,000 and 2,000 acres—it is quite evident that large farms are favorable to preservation and development of live-stock in times of agricultural depression.

THE QUESTION.—It is a grave question which the people of the United Kingdom are called upon to consider at the present time; yet, despite unusual difficulties and trials, there does not seem to be any necessity for undue alarm, or for yielding to any despairing view, or for resorting to any desperate efforts toward obtaining remedies of existing evils. The English farmer must practice his art better and with more intelligence, if he would meet successfully foreign competition; and especially should he improve the breed of animals, and stamp out and keep out diseases hitherto imported. There is, no doubt, ample room for increasing the efficiency of farming in England, and judicious legislation, particularly in improving the outfall of rivers and preventing floods, will materially further this desirable end. In addition, the frank interchange of views, and comparison of interests and advantages between landlords and tenants (a beginning of which has already happily been made), will greatly aid in reaching the much-wished-for result. The Duke of Argyll expresses his "perfect confidence in the prospects of British agriculture, provided those who conduct it are left to do so in the perfect freedom which is the fundamental condition of improvement and of success in all industrial occupations"; and an able English writer expresses himself in

\* Rather more than half the cultivated acres of the United Kingdom (say about 25,000,000) are in permanent pasture, besides the mountain-lands. In Great Britain, out of 32,211,000 acres in cultivation, nearly 15,000,000 are in permanent pasture, besides the mountain-lands.

words worth quoting in conclusion: "Farmers would be ill advised if they allowed the pressure of present difficulties to tempt them to dabble in revolutionary remedies, and, instead of putting their shoulders to the wheel, to invoke the political Hercules of the day as one who has an unbounded power to reform all ills."

**FURTHER STATISTICS.**—It may be added here, from later sources, that the summary of agricultural returns of Great Britain for 1882 gives further evidence of the severe blow which a seven years' cycle of bad seasons has inflicted upon English agriculture. The area of wheat-culture has somewhat increased, but probably to no profit; and there is a decrease in the number of cattle and sheep. The picture as a whole is gloomy; and the one that in the minds of those interested in the matter is, how best to increase the live-stock in English home farming.

**ALABAMA. STATE GOVERNMENT.**—The State officers during the year were as follows:

Governor, Rufus W. Cobb, (Democrat); Secretary of State, W. W. Screws; Treasurer, I. H. Vincent; Auditor, J. M. Carmichael; Attorney-General, H. C. Tompkins; Adjutant-General, J. F. White; Superintendent of Education, H. C. Armstrong; State Librarian, J. M. Riggs. Judiciary: Chief-Justice of Supreme Court, Robert C. Brickell; Associate Justices, George W. Stone and H. M. Somerville.

**LEGISLATURE.**—The Legislature met on the 14th of November. On the 28th John T. Morgan was re-elected United States Senator by 29 votes to 2 for Paul L. Jones in the Senate, and 84 to 10 for Jones in the House. Morgan was supported by the Democrats and Jones by the Republicans and Greenbackers. On December 1st Governor O'Neal was inaugurated. No important legislation had been perfected before the close of the year.

**STATISTICS.**—The following is a summary of receipts and disbursements for each year from 1874 to 1882:

	1874-'75.	1875-'76.	1876-'77.	1877-'78.	1878-'79.	1879-'80.	1880-'81.	1881-'82.

Governor Cobb, in his message to the Legislature, says:

I recommend a further reduction of the tax-rate. In two years the balance in the Treasury has been more than doubled, and is now entirely too large. Taxes should be collected only as they are needed, and to the extent they are needed, for the proper purposes of economical administration.

The debt settlement provided for by the act of February 23, 1876, has been practically completed. There yet remain outstanding a few of the old bonds for which provision is made. As they come in, new bonds, bearing interest from the date of issue, are exchanged for them. It is probable the most of those still out are lost or destroyed. In two years, but \$146,300 of the new bonds, of all classes, have been issued. The total bonded debt, including \$253,500 of eight per centum bonds held by the Agricultural and Mechanical College, is now \$9,407,800, on which the interest charge is \$343,929. There will be no further increase in the rate of interest on any class of bonds until January, 1887, when class A bonds will advance to four per centum. The valuation of property for taxation has been for six years as follows: 1876, \$135,535,792; 1877, \$130,799,138; 1878, \$126,773,262; 1879, \$123,757,072; 1880, \$139,077,328; and 1881, \$182,920,115. So far as the abstracts have been received for 1882, they indicate a still larger aggregate.

The scholastic year ends September 30th, but the reports of the Superintendent of Education are often delayed for reports from county superintendents. The report for 1880-'81 was

not made until the middle of February, 1882, and the report for 1881-'82 was not made during the year. The total revenue of the school department for 1880-'81 was \$397,479.04, derived from the following sources: Interest on sixteenth section fund, \$105,424.49; interest on valueless sixteenth section fund, \$5,825.47; interest on United States surplus revenue fund, \$26,763.47; escheats to the State, \$160.83; annual appropriation, \$130,000; unapportioned balance from 1880, \$1,092.45; and poll-tax collected and retained in the counties, \$128,212.33. This was apportioned as follows: to counties and cities, including the poll-tax, \$382,552.52; to the normal schools, \$13,500; educational contingent fund, \$1,000; unapportioned, \$426.52. The expenditures of the fund were as follows: Paid to teachers of white schools, \$225,867.77; to teachers of colored schools, \$158,901.85; salaries of county and city superintendents, \$11,883.80; normal schools, \$13,500; and contingent expenses, \$535.65. The total number of children within the school ages enumerated was 88,003, of which 217,590 were whites and 170,413 were colored. The total number of children enrolled was 176,289, of which 107,338 were whites and 68,951 were colored. The daily average attendance in the white schools was 66,840, and in the colored schools 48,476. There were 4,572 schools taught during the year, of which 2,981 were white schools and 1,591 were colored schools. The total number of teachers was 4,698, of whom 3,053 were in the white schools and 1,645 were in the colored schools. The average length of time taught in

the white schools was 84 days and in the colored schools 76 days. The average monthly pay of teachers in the white schools was \$22.98 and in the colored schools was \$23.15. It is not likely that there will be any very large variations from these statistics in the report for 1881-'82.

From October, 1880, to October, 1882, there were 75 pupils in the Deaf and Dumb and the Blind Asylum at Talladega, of whom 14 were discharged, leaving at the latter date 61 in the institution, of whom 40 were mutes and 21 were blind.

On September 30, 1880, there were 402 patients in the Hospital for the Insane, of whom 213 were men and 189 were women. During the two years ending September 30, 1882, 188 patients were discharged, 57 died, and 260 were admitted, leaving under treatment 417 patients, of whom 209 were men and 208 were women. Of these, 345 were white and 72 were colored. The causes of death were as follows: Apoplexy, 2; Bright's disease, 2; cerebral softening, 1; cerebral congestion, 2; diarrhoea, 1; epilepsy, 3; fracture of skull, 1; heart-disease, 2; maniacal exhaustion, 9; marasmus, 11; paresis, 6; pericarditis, 1; peritonitis, 1; phthisis, 11; pneumonia, 3; and syphilis, 1. Of the discharges, 126 had recovered, 49 were improved, and 13 were unchanged. In the two years, 155 applications for admission were refused for want of room. From the opening of the hospital in July, 1861, to the date of the last report, 1,895 patients had been admitted into it, of whom 671 had been discharged recovered, 211 discharged improved, 84 discharged unchanged, and 452 had died. The cost of maintaining the hospital for the two years was \$140,003.50, of which \$13,729.41 was for improvements and repairs. An extension to the hospital building is in course of construction.

The effective militia of Alabama consists of two regiments and a few unattached companies, uniformed at their own expense, and armed and equipped by the State. These organizations are numerically weak, numbering in all less than one thousand men, and they are not all as well drilled and disciplined as they should be.

The Governor comments unfavorably upon one feature of the penal law, as follows:

Hard labor for the county, as an alternative for imprisonment in the penitentiary, is peculiar to Alabama. It is unknown in other States. It confounds misdemeanors and felonies. It unequally punishes offenders. The felon in the penitentiary escapes the severer punishment of hard labor for the county, which must be inflicted upon the misdemeanant. The convict to the penitentiary has the benefit of State inspection, which gives him some protection while serving out his sentence, and secures his discharge at its expiration. The convict to hard labor for the county is generally hired to work outside of the county, is subjected to penitentiary discipline, is beyond the care of those who should see that he is humanely treated, and has no assurance of discharge at the expiration of his sentence.

The following is the record of the Alabama Penitentiary for recent years:

YEARS.	Average prison population.	Whites.	Blacks.	Deaths, whites.	Deaths, blacks.	Total.
1875.....	350	60	290	2	21	23
1876.....	500	55	445	5	18	23
1877.....	600	60	540	4	41	45
1878.....	680	74	606	..	16	16
1879.....	660	77	583	5	18	18
1880.....	600	74	526	5	37	42

In 1872 only 10,000 tons of coal were mined in Alabama. In 1879 were mined 290,000 tons; in 1880, 340,000 tons; in 1881, 400,000 tons.

According to the census of 1880, the State produced 699,654 bales of cotton, 25,451,273 bushels of corn, 3,039,639 of oats, and 1,529,657 of wheat.

The following is the cotton statement of the port of Mobile, August 31, 1882:

By means of the improvement of Mobile Bay which has just been completed by the United States Government, a vessel drawing twenty-three feet may now enter the lower bay and find secure anchorage, and a vessel drawing seventeen feet may pass from the lower bay direct to the wharves of the city.

The following table gives the population by counties, distinguished as white and colored, according to the census of 1880:

COUNTIES.	POPULATION.			COUNTIES.	POPULATION.		
	Total.	White.	Colored.		Total.	White.	Colored.

Included in the total are 4 Chinese and 213 Indians. There were living in the United States 1,319,189 persons born in Alabama (708,904 white and 610,285 colored). Of the total population 622,629 were males and 639,876 females, 1,252,771 native and 9,734 foreign born. Of persons ten years of age and upward, 370,279, or 43·5 per cent, could not read, and 433,447, or 50·9 per cent, could not write. Of the latter, 111,040 were native whites, being 25 per cent of that class, and 321,680 were colored, being 80·6 per cent of that class. There were 141,461 white and 118,423 colored males twenty-one years of age and over. The number of horses on farms was 113,950; mules and asses, 121,081; working oxen, 75,534; milch-cows, 271,443; other cattle, 404,213; sheep, 347,538; swine, 1,252,462; manufacturing establishments, 2,070; capital, \$9,668,008; hands, 10,019; value of materials used, \$8,470,205; products, \$13,565,504.

**POLITICAL CONVENTIONS.**—The Democratic State Convention met in Montgomery on the 7th of June, and on the second day nominated the following ticket:

For Governor, Edward A. O'Neal, of Lauderdale; for Secretary of State, Ellis Phelan, of Jefferson; for Attorney-General, Henry C. Tompkins, of Montgomery; for Treasurer, Isaac H. Vincent, of Chambers; for Auditor,

Jesse M. Carmichael, of Dale; for Superintendent of Education, Henry C. Armstrong, of Macon.

The following is the platform adopted:

*Resolved*, by the Democratic and Conservative party of Alabama, in convention assembled:

1. That we re-affirm our devotion to the time-honored principles of the Democratic party; a strict construction of the Federal Constitution, obedience to the laws of the General Government within its constitutional limits, and maintain the right of the State to regulate its local affairs by its own authority.

2. We are unalterably opposed to the continued acts of the Federal authorities tending to centralization of all power in the General Government, to the destruction of local self-government.

3. We present the record of the administration of the State's affairs while in the control of the Democratic party as an earnest of the fidelity of the party to the principles of economy and good government. We invite immigration and capital to our State, and pledge full and perfect protection to all such as may come among us.

4. That public education should be fostered and encouraged by the State as far as the means of the State will allow, having at the same time due regard to the preservation of the public credit.

5. We recognize the necessity of protecting and preserving the purity of the ballot-box as the safeguard of free institutions, and condemn any attempt to interfere with the free and full exercise of the elective franchise.

The nominee for Governor was born in Madison County in 1818. He was a general in the

Confederate army. In 1841 he was elected solicitor of his circuit; in 1875 he was a member of the Constitutional Convention, and in 1880 one of the Hancock electors from the State at large.

The Independent-Greenback State Convention met in Birmingham on the 5th of July, and nominated the following ticket:

For Governor, James L. Sheffield, of Marshall; for Secretary of State, A. H. Townsend, of Butler; for Attorney-General, Paul L. Jones, of Madison; for Treasurer, John W. Montgomery, of Jefferson; for Auditor, John B. Shields, of Walker; for Superintendent of Education, Dr. Ira G. Wood, of Jackson.

On the 6th the Republican State Convention met in Montgomery, and indorsed the above ticket; but Charles P. Lane, of Limestone County, was subsequently substituted for Mr. Jones. The following platform was adopted, which is substantially that of the Birmingham Convention:

*Be it resolved*, by the Republicans of Alabama in convention assembled:

1. That we favor such amendment or revision of the present election law of Alabama as will give each voter of the State assurance that his ballot will be counted as cast, and that the real result of every election will be honestly declared, and will remove the existing inspectors and other officers of election, and render it impossible to defeat the will of the majority by making fraudulent returns.

2. That, while demanding that adequate punishment shall be meted out to every violator of the law, we favor such changes in the convict system—both State and county—as will at least tend to reform as well as punish criminals, to humanize rather than brutalize them, and also such other changes as will put an end to the conflict now existing, in some portions of the mineral districts of our State, between cheap convict-labor and the working-man.

3. That we favor a liberal support to the free schools of the State, and an enactment of such laws as will foster and cherish our school system.

4. That we favor the enactment of such laws as will not only invite, but make it to the interest of, immigrants to seek homes in Alabama.

5. That we favor, as far as the same may be practicable under our organic law, the encouragement and protection of manufactories of all kinds in our State for such time as may be necessary to secure their permanent establishment. This we favor, believing that the prosperity of all the people depends largely upon it.

6. That we favor and heartily approve the protection of all home industries by the Federal Government, and we recognize in the principle "protection for protection's sake" the wisdom that cherishes its own, and in its application by the National Republican party in its administration of the government we recognize the statesmanship that favors the laboring man of the nation by enlarging and increasing the demand for labor; and at the same time taking from their shoulders the burden of taxation and placing it on the wealthy.

A State Temperance Convention was held in Montgomery on the 21st and 22d days of November, which agreed to ask of the Legislature certain amendments and new laws looking to the restriction of the liquor-trade.

**ELECTION RETURNS.**—The election in August resulted in the choice of the Democratic ticket. The aggregate vote was as follows: For Gov-

ernor, Edward A. O'Neal, 100,591; James L. Sheffield, 46,386. For Secretary of State, Ellis Phelan, 103,153; A. H. Townsend, 44,798. For Treasurer, Isaac H. Vincent, 102,780; J. W. Montgomery, 43,639. For Auditor, Jesse M. Carmichael, 100,968; J. B. Shields, 45,053. For Attorney-General, H. C. Tompkins, 103,562; C. P. Lane, 44,605; Paul Jones, 20. I. H. Vincent received 1,031 for Auditor intended for Treasurer. J. M. Carmichael received 1,041 for Treasurer, and Jas. M. Carmichael 2,247 for Auditor; all intended for Jesse M. Carmichael. For Superintendent of Education the vote was: Armstrong, 104,170; Wood, 47,133. The Legislature stands as follows: Senate, 31 Democrats and 2 opposition; House, 79 regular and 7 independent Democrats, and 14 opposition. Democrats were elected to Congress in November in each of the eight districts.

#### ALASKA AND ITS FUR-SEAL INDUSTRY.

The population of Alaska Territory is given by the census of 1880, by districts, as follows: Yukon Division, 7,000; Interior Division, 2,226; Kuskokwim, 3,654; Bristol Bay, 4,340; Kadiak, 2,606; Kenai, 984; Belkovsky, 669; Oonalaska, 1,392; islands in Behring Sea, 1,290; Prince William Sound, 500; Southeastern Alaska, 6,725; total, 31,386, of whom about 18,000 are supposed to be Esquimaux or Innuits. In addition to these, who represent the regular population, are about 1,500 whites, mostly traders and miners, in Southeastern Alaska. The Aleutian population and a part of the Innuits were civilized under the Russian domination, and live after the European style; of these, some 8,000 or 9,000 are attached to the Russian Greek Church.

Recent surveys show that the country is much more important, and its resources are more extensive, than had been supposed. Its area (580,107 square miles) is equal to that of all the United States east of the Mississippi River, and north of Georgia and the Carolinas. It measures 1,400 miles in direct line from north to south, and 2,200 miles from its eastern boundary to the end of the Aleutian Islands, and has a total of 25,000 miles of coast-lines. The total area of its islands is 31,205 square miles. Its principal river, the Yukon, may be ranked among the largest rivers in the United States, being seventy miles wide across its five mouths and the intervening deltas, and from one to five miles wide for the first thousand miles of its course. It is known to be navigable for 1,500 miles, and is believed by Mr. Robert Campbell, of the Hudson Bay Company, who has explored the streams, to be, with its tributary, the Pelly, navigable, when full, for nearly 3,000 miles. The land abounds in fur-bearing animals; the seas yield fur-bearing seals and otters, and fish in many varieties and immense quantities. Three thousand tons of codfish were caught on the banks off the Shumagin Islands, during 1879, for houses in San Francisco. Salmon-

canneries have been established near Sitka, at Klawak, and at Kasaan Bay. The southeastern section of the Territory is densely covered with forests of yellow-cedar, white-spruce, and balsam-fir. Coal has been found at different places along the coast; petroleum near the Bay of Katmai and on Copper River; copper abundantly on Copper River and at Kasaan Bay; lead on Whale Bay and in Kadiak Island; iron and graphite in many places; marble and sulphur in large quantities; bismuth on Vostovia Mountain; and kaolin, fire-clay, gypsum, amethysts, zeolites, garnets, agates, carnelians, and fossil-ivory are also found. Gold-mines, both placer and quartz, were opened during 1881 on Gastineaux Channel, opposite Douglas Island,

when the Board of Home Missions of the Presbyterian Church in the United States of America began to establish schools. That board has now five schools in the Alexandria Archipelago (including Sitka and Port Wrangell), in all of which the English language is taught. These schools, with two which are supported by the Alaska Commercial Company on the Seal Islands, and the two Russian schools already mentioned, represent all the facilities for education existing in this vast Territory.

An exploring expedition left San Francisco for Alaska during the summer, under the direction of Mr. Edward Schieffelin, who purposed to ascend the Yukon River as far as possible. He took with him a stern-wheel steamer and three

and yielded more than \$30,000 during the first summer. Gold is supposed to exist in many other places; and the Cassiar mines of British Columbia, which are near the Territory, probably extend into it.

Sitka, the capital of the Territory, is the port of Alaska most familiarly known to Americans of the States, but is really, according to Mr. Henry W. Elliot, of the United States Commission of Fish and Fisheries, inferior in importance to several other places. "Kadiak, Oonga, Belkovsky, and Oonalaska," says this author, in his "Monograph of the Seal Islands of Alaska," "each has a greater population than has Sitka to-day, and each has a hundred-fold more importance as a trade-center."

A considerable number of schools were established by the Russians while they held Alaska, both on the main-land and on the islands. When the Territory passed under the control of the United States they were all discontinued, except one at Oonalaska and one at Belkovsky; and education was neglected until 1877,

companions, and expected to spend a year in his cruise.

**FUR-SEALS.**—One of the most important business industries of Alaska is connected with the capture of the fur-seal (*Callorhinus ursinus*) at the Pribylov Islands, and the trade in its furs, which are under the exclusive control of the Alaska Commercial Company. The fur-seals, particularly as represented by the southern species (*Arctocephalus Australis*), were formerly numerous and widely distributed, frequenting the islands of the coast of South America and of the Southern and Antarctic Oceans; but they have been nearly exterminated by reckless hunting, and now only a comparatively insignificant part of the world's supply is drawn from these sources. In the northern hemisphere they are not represented in the Atlantic Ocean at all, and in the Pacific Ocean only at two localities, the Pribylov Islands St. Paul and St. George, Alaska, and Behring and Copper Islands, of the Commander Group, which are under Russian jurisdiction. The world's supply

of seal-furs is principally derived from the former locality, where the seal population is, by wise management, kept up unimpaired.

The Pribylov Islands lie in the heart of Behring Sea, 192 miles north of Oonalaska, 1,400 miles west-northwest from Sitka, and 2,250 miles west-northwest from San Francisco. They include the Islands of St. Paul and St. George, which lie from twenty-seven to thirty miles apart, and of which St. George lies southeastward of St. Paul. The Island of St. Paul, the larger of the two, has an area of about 33 square miles, or 21,120 acres, and 42 miles of shore-line, of which  $16\frac{1}{2}$  miles are "hauled" over by fur-seals. St. George has an area of about 27 square miles and 29 miles of coast-line, of which  $2\frac{1}{2}$  miles only are visited by the seals. The islands are inhabited by 390 Aleuts (298 on St. Paul and 92 on St. George), who dwell in comfortable houses in the villages of their respective islands, and are employed in killing the seals.

The fur-seal, which resorts to these islands to breed and shed its hair and fur, is the highest organized of all the animals of the order (*Pinnipedia*) to which it belongs, and exhibits an instinct of an extraordinarily high order. It is distinguished from the hair-seal (*Phoca vitulina*), with which it has not even a generic affinity, by its erect habit and black or ochre-colored body. The male, or "bull," when fully grown, measures between six and a half and seven and a half feet in length, and will weigh between four hundred and six hundred pounds. The head appears disproportionately small in comparison with the thick neck and shoulders, but is nearly all occupied by the brain; the eyes are bluish hazel, with a changing expression; the muzzle and jaws are of about the same size and form as those of a Newfoundland dog, but with firmly lined and compressed lips; it has a long, yellowish-white and gray mustache; and it carries its head about three feet from the ground. The females, or "cow-seals," are between four and four and one half feet in length, are much more shapely in their proportions than the bulls, and have handsome heads and eyes, and an expression of considerable intelligence. They resort to the islands for the purpose of giving birth to their young, reaching there at the end of their period of gestation, and generally within a day or two of their time of delivery. The selection of the Pribylov Islands for resort is determined by the peculiar adaptation of the beaches to the habits and comfort of the animals during the breeding-season. The shores present, at the places selected for the "hauling" and breeding-grounds, gentle slopes of shingle or a firm, well-drained surface, to which the seals can travel without discomfort, and where they can lie without annoyance from mud or sand, from May till October, every year, in perfect physical health and security.

The "bull-seals" seek the islands considerably earlier in the season than the cow-seals,

the first arrivals taking place early in May, and the great body reaching the grounds about the first of June, while the females do not come up till three weeks or a month later than the latter time. Each bull selects a spot about six or eight feet square, which he defends as his own against all rivals, and to which he invites the females when they have come to the shore, till he has collected a "harem" of fifteen or more cows around him. The breeding-season is at its height from the 10th to the 15th of July in every year, after which it subsides at the end of that month and in August. It is also established that the breeding is confined entirely to the land, and that it is never effected in the sea; the females bear their first young, a single pup each, when they are three years old, after about twelve months of gestation. The animals begin to scatter from the definite limits of their breeding-places about the 25th of July, and the "rookeries" are entirely broken up after the middle of September, when the "pups" have all learned to swim. By far the largest number of the male seals, including those which are not yet six years old, fail in the competition to establish themselves on the breeding-grounds and to secure harems of females. They are called "bachelor-seals," or, in Russian, "holluschickie," and are allotted distinct grounds, called "hauling-grounds," after the seal's peculiar mode of progression. The hauling-grounds, with the passages leading to them through the breeding-grounds, are definitely marked off, and the boundaries are strictly respected by both the breeding and the bachelor seals. The bachelor-seals are the particular objects of the chase which is conducted on the islands. The hunting-season nearly corresponds with the breeding-season, the greater proportion of the work being done in June and July. The process of hunting is rather one of driving the animals from the "hauling-grounds" to the "killing-grounds," as domestic animals are driven, for the seals are quite tame and obey the commands of their drivers with docility. Only, care has to be taken to avoid over-driving and heating them, which destroy the quality of the fur. The killing is done by the native inhabitants of the islands, who, armed with clubs about five or six feet in length and three inches in diameter (which are made in New London for the purpose), and knives, knock them on the head, stab them to the heart, and skin them speedily, before a peculiar reaction, which they call "heating," has had time to set in. The skins, which weigh from five and a half to twelve pounds each, according to the age of the animal, are salted, and piled, "hair to fat," in bins, whence, after having lain two or three weeks, till they are "pickled," they may be taken out at any time and rolled into bundles of two skins each, with the hairy side out, ready for shipment.

The business of hunting the seals and curing the skins is, by act of Congress, a monopoly of the Alaska Commercial Company of San Fran-

cisco. This company was organized by Mr. H. M. Hutchinson and Captain Ebenezer Morgan, who were the first persons to visit the islands in search of seals (in 1868) after they had passed into the possession of the United States. They perceived what the islands could be made to yield permanently under proper regulations, and also that the seals would be speedily exterminated if such regulations were not adopted. They accordingly procured an order from the Treasury Department declaring the islands a governmental reservation, and afterward an act of Congress for the protection of the fur-bearing animals on the islands. This act limits the time when the seals may be killed to the months of June, July, September, and October in each year; prohibits killing by fire-arms, or any other means that will tend to drive the seals away, as well as the killing of female seals or of any seals less than one year old; and the killing of any seals in the waters or "on the beaches, cliffs, or rocks where they haul up from the sea to remain"; limits the number that may be killed to 100,000 in each year, besides what the natives may require for their food; and provides for the leasing of the exclusive privilege of killing the seals for the term of twenty years. The lease was awarded to the Alaska Commercial Company, whose charter, rules, and regulations have been framed to accord with the provisions of the law. Practically the company does not allow more than 99,850 seals to be taken on its account in a single year. The natives use 5,000 or 6,000 more. The company employs a fleet of four steamers and a dozen or fifteen sailing-vessels, and gives its principal attention to the seal-islands, while it has also stations scattered over the Aleutian Islands and that part of Alaska west and north of Kadiak. Outside of the seal-islands, all trade in Alaska is open to the public.

The whole number of breeding-seals and their young on the two islands was calculated from actual survey in the season of 1873 to be 3,193,420. This enormous aggregate is entirely exclusive of the great numbers of non-breeding seals, to which the killing is confined, which are never permitted to come to the breeding-grounds. The animals of the latter class are nearly equal in number to the adult breeding-seals, and may therefore be counted at at least 1,500,000; so that the grand total of the fur-seal life on the Pribylov Islands is represented by more than 4,700,000 individuals.

The theoretical value of the interests of the Government on the islands, measuring it by the value of 2,500,000 or 3,000,000 adult fur-seals, male and female, in good condition, is estimated by Mr. Henry W. Elliot, of the United States Commission of Fish and Fisheries, to be not less than \$10,000,000 or \$12,000,000; taking, however, the females out of the question and from the calculation, and including the "holuschickie" alone, as they really represent the only killable seals, then the commercial value

of the same would be expressed by the sum of \$1,800,000 to \$2,000,000—a sum which stands as a permanent principal in the islands, and returns the public Treasury upward of \$317,000, or more than 15 per cent, annually.

In answer to the question, which has been frequently asked him—whether the seals are not in danger of being exterminated at the present rate of killing them—Mr. Elliot says that, provided matters are conducted on the islands in the future as they are to-day, and no plague or abnormal causes of destruction arise, one hundred thousand seals under the age of five years, and more than one year old, may be safely taken every year, without the slightest injury to the birth-rates or regular increase. This assertion is based on the estimate that about a million "pups," or young seals, are born on the islands every year, of which about one half, or 500,000, are males. These animals reach the sea, having suffered a loss of not more than one per cent, but are there exposed to destruction by various agencies, in consequence of which not more than half of them, or 250,000 males, return in the following year. After that time the causes of destruction are less extensively operative, and 225,000 out of the original 500,000 male young, with as many females, may be expected to live out the ordinary terms of their natural lives. Not more than one in fifteen of the males born is needed for breeding purposes in the future; but, even if one fifth of them are reserved, there are still left 180,000 animals that might be safely killed every year. Mr. Elliot further states his belief that it is not possible by any management materially to increase the production of the islands. The total number of skins taken—from 1797 to 1880—is computed, from the best data that can be obtained, at 3,561,051. The Alaska Commercial Company paid into the Treasury of the United States, from July, 1870, to August, 1881, in taxes and rental, the total sum of \$3,452,408.50. The fur-seals are voracious eaters, and live on fish, of which, estimating that each individual requires ten pounds a day, they can hardly consume less than six million tons every year. They are also, in their turn, particularly the young ones, preyed upon actively by the killer-whale (*Orca gladiator*). The most probable contingency under which a change may be produced in the seal productiveness of the Pribylov Islands may possibly arise from a diversion of the herds to Behring and Copper Islands, of the Commander Group, in Russian territory, which afford equally favorable grounds for their rookeries, and are now sparsely visited by them. No other coast in the region is adapted to them. Between 1862 and 1880, 287,462 fur-seal skins were shipped from the Commander Islands.

Among other animals of the Pribylov Islands which are applied to economical uses are the sea-lions (*Eumetopias Stelleri*), which are little appreciated in the commercial world, but are invaluable to the natives. Their skins are used

for covering the native boats, and the tough parts are made into boots; their intestines are sewed together into water-proof garments; their stomach-walls are used as oil-pouches; their carcasses are preserved by hanging in the open air for the winter's supply of meat; and their mustache-bristles are sold to the Chinese for use as pickers to opium-pipes, and in the ceremonies of the joss-houses. These animals are far less numerous than the fur-seals. Mr. Elliot does not believe that the number of them, resorting to the islands for breeding purposes, exceeds ten or twelve thousand.

**ALGERIA AND THE SEA.** The population of Algeria, according to the census of 1881, is as follows:

DEPARTMENTS.	Inhabitants under civil administration.	Inhabitants under military administration.	Total.
Algiers.....	1,072,762	178,910	1,251,672
Oran.....	674,880	92,492	767,372
Constantine.....	1,075,855	216,068	1,291,923
Total.....	2,823,497	487,470	3,310,967

The inhabitants of Algeria are of two distinct races—the Arabs, who invaded and conquered the country, and the Kabyles, who have lived in the country since the time of the Romans, and who were driven into the mountains by the Arabs. Great differences exist between these two races. The Kabyles speak a language which is not understood by the Arabs. They build houses, have a municipal organization which was given to them by the Romans, and cultivate with care small tracts of land, fence and protect them like the Europeans. They hate the Arabs, to whose rule they have never entirely submitted. The ruins of former Kabyle villages can be found in many places. The Kabyles retain to the present day the traditions of the cruel conquest of the Arabs. On the other hand, the Arabs are an idle and destructive race. They do not cultivate more ground than is necessary to produce a supply for their immediate wants, and even this little is done without care and without method. The two races are described by recent French authors, the one as industrious and capable of being civilized, the other lazy, vicious, and entirely opposed to civilization. They have completely separated from each other, and are kept apart by their mutual antipathy. It is now proposed that the French shall make an effort to attract the Kabyles by presenting themselves to the latter as their liberators, and inviting them to descend from their mountains to the fertile plains which formerly were occupied by their ancestors. Thus, it is thought, the French Government would be able to reduce its army of occupation, by opposing the Kabyles to the Arabs.

The question of creating a large inland sea on the south of Algeria has long been agitated in France. A few years ago Commandant Roudaire carefully examined the desert which

it is proposed to change into a sea, and made an estimate of the cost. Afterward he organized a company ready to undertake the work. He then applied to the French Government for a concession to go on with the enterprise; and the latter, on April 27th, appointed an extraordinary commission to investigate the subject in all its bearings. The plan of Commandant Roudaire is to change into a sea the three great natural depressions on the south of Algeria, called *Shotts*, known as Rharsa, Melrir, and El-Djerid, which extend from east to west to the Gulf of Gabes, in Tunis. Of these only the first two lie below the level of the sea, while the surface of El-Djerid is on an average 66 feet above, so that a canal would have to be dug through the latter, in order to fill the other two with water. This canal would be about 190 miles long, and, although passing through a desert, could be constructed. With regard to the cost, M. Roudaire estimated that about 46,800,000 cubic yards of sand and clay and 1,950,000 cubic yards of rock would have to be removed, which, at 15½ cents per cubic yard, would amount to \$7,500,000. For other digging and excavation M. Roudaire estimates \$2,800,000, which, together with the cost of the necessary machines, and \$4,000,000 for miscellaneous expenditures, would bring the total amount to about \$15,000,000. This sum had been subscribed, and the company only asked of the Government the concession, and the land which will border on the sea. Among the receipts expected by the company, the principal ones were those from fisheries and salt-works which were to be established.

The commission appointed by the Government divided itself into three sub-commissions—the first a technical one, which was to examine into the feasibility of the project; the second a physical commission, which was to examine into the meteorological and sanitary conditions; and the third a political one, to investigate the question from a political, strategical, moral, and commercial view. The first and most important sub-commission came to the conclusion that the plan was a feasible one, and could be practically carried out. With regard to the cost, however, the commission rejected completely M. Roudaire's estimates. According to its own calculation, it arrives at the following result: If the *Shotts* are to be filled in to the necessary height, it would require a constant flow of 243 cubic yards of water per second in order to make up the losses by evaporation, and to keep the sea at the proper level. The canals must be wide and deep enough to furnish this amount of water, while, at the same time, the current must not exceed 1½ foot per second. According to the estimates of the commission, the construction of the canal would cost, in ordinary ground, 15½ cents per cubic yard, and for rocks 46½ cents per cubic yard, or, in all, \$90,600,000. In order to fill the proposed sea, 223,600,000,000 cubic yards of water would be necessary, and, to do

this at the rate of 243 cubic yards per second, or 6,696,000,000 per year, twenty-nine years would be necessary, without taking into account the loss by evaporation. If this loss is taken into account, the commission thinks, the sea would never be filled at that rate. It furthermore thinks that the formation of an inland sea could not be undertaken, with any expectation of success, if a longer time than ten years was required to fill its basin. But, in estimating the amount of water required, both for filling and replacing the losses by evaporation during the ten years, the commission arrives at a total of 289,000,000,000 cubic yards. This would necessitate a supply of 915 cubic yards per second. As to the amount of the expense, the commission estimated the cost of construction at \$145,539,800, other expenses at \$7,276,990, and interest on the capital for twelve and a half years, at 5 per cent, at \$95,510,500—in all, \$248,327,290. The second sub-commission was of the opinion that an inland sea would bring about a decided improvement in the temperature, climate, and sanitary condition of the country. The third sub-commission reported that, in its opinion, no international difficulties were to be apprehended in consequence of the formation of the sea. It would offer but small advantages in the military defense of the country, while for the navy the most important result would be the creation of a port at Gabes. It could not be assumed that the sea would become the means of creating a large commerce. If an improvement of the climate should take place, it might be possible to permanently settle the Arabs, and to accustom them, under the direction of the Europeans, to regular labor. The full commission, after having received these reports, passed the following resolution at its last session, held on July 7th:

The commission, while fully appreciating the interesting labors of M. Roudaire, and admiring the courage and perseverance which he has shown in the course of his researches in the south of Algeria and Tunis, is, in view of the fact that the expenses would be out of all proportion to the benefits to be derived therefrom, of the opinion that it is not advisable for the French Government to encourage this undertaking.

**ALPS, TUNNELS OF THE.** In May, 1882, the tunnel through the St. Gothard was finished and formally opened. This great work was begun in 1870, by Switzerland and Italy. These countries had entered into a convention for that purpose in 1869, which Germany joined in 1871. The cost was estimated at 187,000,000 francs, of which 85,000,000 francs were to be furnished by government subsidies, Italy paying 45,000,000, and Germany and Switzerland 20,000,000 francs each. The length of the tunnel is 14.92 kilometres, or about nine miles. It begins at Goeschenen and ends at Airolo. With the exception of a curve of 240 metres, it is perfectly straight. In addition to the tunnel, it was proposed to build the following lines: Lucerne-Küssnacht-Im-

mensee-Goldau, Zug-St.-Adrian-Goldau, Goldau-Flüelen-Biasca-Bellinzona, Bellinzona-Lugano-Chiasso, and Bellinzona-Magadino-Luino, with a branch to Locarno. In 1876 it was found that a very considerable deficit existed, which was estimated at 102,000,000 francs. At a conference of the three powers, held in 1877, this was reduced to 40,000,000 francs by dropping the lines Lucerne-Immenensee, Bellinzona-Lugano, and Zug-Art. The railroads belonging to the Gothard system, according to this calculation, have a length of 186.6 kilometres, or 116 miles. The deficit was covered by subsidies from Italy and Germany to the amount of 10,000,000 francs each, and from Switzerland 8,000,000 francs, while the balance of 12,000,000 francs was raised by the Gothard Railroad Company. The highest point of the tunnel is 1,162.5 metres above the level of the sea. (See ENGINEERING.)

The St. Gothard Tunnel was regarded in France, long before its completion, with feelings of envy, as it was feared that a great portion of the through freight from the North Sea to the Mediterranean would be lost to the French railroads; and when, therefore, in 1880, the Swiss Federal Council inquired of the French Government whether it would favor an international conference on the subject of a tunnel through the Simplon, a pass through the Alps in the Canton of Valais, the latter answered that the subject was even then being considered by the proper ministers. The consideration of this question was interrupted by a ministerial crisis. Then a motion was made, and supported by 109 deputies, in the French Assembly, to assist the Simplon line with 50,000,000 francs. A commission was appointed to investigate the matter, which made a technical examination of the proposed route, but rather favored another which was spoken of at the time, through Mont Blanc. The general elections again put a stop to the work, as it is a parliamentary custom in France, as elsewhere, that a question proposed in one House falls to the ground when the term of the Assembly expires. Nothing has since been done by the French Government. The Railroad Company of Western Switzerland, which is largely interested in the proposed Simplon Tunnel, has recently again applied to the Swiss Federal Council, and the latter has addressed the French Government. But, owing to fresh ministerial complications in France, it has seemed most prudent to postpone action until the negotiations with France for commercial customs were concluded.

For the Mont Blanc route it is claimed that it would secure for France the through freight from Calais to Chamounix, on the Italian border, for 928 kilometres, and that the distance by this route would be 85 kilometres less than by the Mont Cenis route, which is now used, between Calais and Piacenza. The road from Calais to Genoa, through Mont Blanc, would be 41 kilometres shorter than through

the St. Gothard, and 25 kilometres shorter than by way of Mont Cenis.

One of the results of the St. Gothard Tunnel is the opening of the new railroad from Novara to Pino, the most direct route between the St. Gothard and Rome. The Milan line ascends the Monte Ceneri at Giubiasco, a village below Bellinzona, while another railroad branches off to the right to Locarno, passing through the swampy delta where the Ticino empties into the Lago Maggiore. At the first station of this road, at Cadenazzo, another road branches off, which, passing along the left bank of the lake,

the through commerce from England to the Mediterranean, and which has been brought forward very recently, is to build a new and direct line from Calais to Marseilles. Among the promoters of this new line are M. Rothschild and a number of deputies. The line after leaving Calais would touch Boulogne and Abbeville, then leaving the Railroad of the North, which from Abbeville extends on to Amiens, it would go direct to Paris by way of Beauvais and Pontoise. From Paris it is to pass by way of Nevers to Lyons, and from there would follow the line from Paris to the Mediterranean,

to Avignon, and Marseilles. This great line would make several important connections, as follow: with Dijon, Lausanne, Geneva, and Italy by way of Dôle and Poligny; with St. Etienne; with Clermont-Ferrand; and with Cette. These connections bring the new line in direct communication with the different lines of the great French companies, and with the Swiss and Italian railroads. In addition, all local roads which could be joined with the main line or its branches would be ceded to this company. (See *ENGINEERING*.)

#### ANGLICAN CHURCHES.

The history of the Church of England during 1882 was marked by continued agitation respecting questions of ritual, and the right of clergymen to obey in respect to them the monitions of their consciences, as opposed to the decrees of the secular power; by the progress of movements seeking to reform the system of patronage; and by continued activity on the part of the advocates of disestablishment and disendowment.

A return issued by the House of Lords shows that there were in the province of Canterbury, in 1880, 4,371 stipendiary curates, and in the province of York, 1,269, making a total, in England and Wales, of 5,640.

A statistical table, published in the "Church Times," gives the total number of confirmations in the two ecclesiastical provinces, during 1881, as 176,464; of these, 105,910 were of girls and women, and 70,554 of boys and men. The largest number of confirmations in any one diocese was 15,525, in that of London; the next largest, 15,183, in that of Manchester; and the third largest, 11,517, in the diocese of Lichfield.

**CONDITION OF CATHEDRAL CHURCHES.**—The Royal Commissioners for inquiring into the condition of cathedral churches in England and Wales stated in their first report that they had

PROPOSED TUNNELS OF THE ALPS.

leads to Pino. Here it connects with the Italian road, which, after passing to Sesto by way of Luino, crosses the Ticino, which leaves the lake at that point, and then after crossing the railroad from Arona to Milan passes on to Novara and there connects with the roads to Turin and Genoa. The entire line from Pino to Novara is forty-one miles long, and passes through eighteen tunnels, which together have a length of eight and a quarter miles.

Another plan to preserve for French roads

held sixty-two meetings, and had had twenty-nine cathedrals under consideration. The report recommended that application should be made to Parliament for the establishment of a Committee of Privy Council for cathedral purposes, to consist of the Archbishops of Canterbury and York, the Bishop of London, the Lord President, the Lord Chancellor, and two other members of the Privy Council (being members of the Church of England), and to have power to approve cathedral statutes. In a statement of the general principles which they had adopted for their guidance, the commissioners indicated that they would propose regulations for the conduct of cathedral services, and suggested that the capitular bodies might give instruction in theological subjects, and offer their services as preachers; while canons, where accommodation renders it possible, should reside within the cathedral precincts for eight months during the year, and should not hold preferment inconsistent with the performance of diocesan duties. All propositions recommended in the report are qualified by the reserve that vested interests must be respected.

The *Bishopric of Newcastle* was constituted by an order of council issued in May, the diocese to consist of the county of Northumberland and the towns of Newcastle and Berwick-upon-Tweed; the parish church of St. Nicholas, at Newcastle-on-Tyne, to be the cathedral church; and the bishop to be subject to the metropolitan jurisdiction of the Archbishop of York. The Rev. Ernest Roland Wilberforce was appointed bishop of the new diocese, and was consecrated in Durham Cathedral July 22d, and enthroned on the following Thursday.

A report in favor of the separation of the Channel Islands from the see of Winchester, and their constitution into a separate diocese, has been made by a joint committee of the two Houses of Convocation. The new bishop, it is proposed, should have jurisdiction over the English congregations in Europe which are not under the direction of the Bishop of Gibraltar.

**MISSIONARY SOCIETIES.**—The reports of the missionary societies of the Church of England showed that they had enjoyed a year of financial prosperity at home, and of encouraging success in the mission-fields abroad. The income of the *Church Missionary Society* had been £221,135, and had been exceeded in only two years—1878 and 1880—in the history of the society. The expenditures had fallen below the income. More than £8,000 sterling had been applied for specific purposes, among which were included a college in Hang-chow, China, the extension of the missions on the Niger and among the Esquimaux, etc. The society employed 260 missionaries, 226 native clergy, and 2,900 native lay agents, and had connected with its churches 86,000 communicants, 160,000 native Christian adherents, and 1,527 schools, with 65,000 scholars. The mis-

sion in Sierra Leone continued to develop self-reliance, and make progress in self-support; a large re-enforcement of laborers was to be sent to Uganda, on the north shore of the Victoria Nyanza. Considerable numbers of Moslem children were attending the schools in Palestine; a station in connection with the Persian mission was soon to be opened in Bagdad; in India the native churches were growing in number and strength, and 120 of the clergy were native against 94 European missionaries; better relations had been established with the Bishop of Colombo, in Ceylon; and an extension of the mission in China—where the native Christians had doubled in the last five years—was proposed, in three of the provinces.

The *Society for the Propagation of the Gospel* had received, on all accounts, £134,978, of which £36,643 were in special funds for particular objects. It employed 594 missionaries, and 1,283 catechists and teachers, and had 300 students in colleges abroad. The field of the work of this society includes British residents in the colonies, and everywhere, of whom the membership of its churches is chiefly composed, and only a small proportion of its resources is spent in work among the heathen. The bishops of Madras reported to the society that the number of baptized native Christians connected with the Church of England had increased during four years from 79,917 to 101,246, the increase being 21,329, or 27 per cent. One half of this increase belonged to the Church Missionary Society and one half to the Propagation Society. The mission at Rangoon, in Burmah, had now fourteen ordained missionaries (including six native clergymen), 1,400 communicants, 3,500 native Christians, and 54 chapels.

The receipts of the *South American Missionary Society* were £11,639, and its expenditures £12,887. Its mission in Terra del Fuego was under the charge of one clerical and eight lay missionaries. The clerical missionary, the Rev. Thomas Bridges, had compiled a grammar and dictionary of the Yahgan language, and had translated the Gospel of Luke and the Acts of the Apostles, and was now engaged upon a translation of the Gospel of John, into that language.

**CHURCH AND STATE.**—Both Houses of the *Convocation of Canterbury* met for the dispatch of business, February 14th. The *Convocation of the Province of York* met at the same time. An important report on "Church and State," prepared by a joint committee of the two convocations, was considered in both bodies, and was approved in the Convocation of Canterbury, but was deferred in the Convocation of York. Its substance is as follows:

Your committee having been appointed to consider the constitutional relations between the authorities ecclesiastical and civil in this Church and realm, and the best methods whereby common action may be taken by them in matters affecting the Church, have, in conference with a similar committee of the Lower House of the Convocation of Canterbury, agreed to

the following resolutions, which they have now the honor to submit as their report, viz.:

1. That no settlement of ecclesiastical judicature will be satisfactory which does not proceed upon the principle that the ancient canonical courts be preserved, subject to such amendments as may be deemed necessary, and shall receive synodical approval.
2. That all ecclesiastical judges be, as far as possible, canonically qualified and commissioned.
3. That the Archdeacon's Court be retained, and strengthened if necessary.
4. That all questions relating to doctrine, ritual, and discipline, except such as come under the jurisdiction of the archdeacon, be referred, in the first instance, to the bishop, who may stay all proceedings, or hear the cause either in *camera* or in his court, as he may determine.
5. That the ancient provincial courts of Canterbury and York be retained with their separate jurisdictions.
6. That, in accordance with the constitution of this Church and realm, the right of appeal for the maintenance of justice in all ecclesiastical causes lies to the Crown.
7. That, in cases of appeal to the Crown for the maintenance of justice in questions involving doctrine or ritual, the judgment of the spirituality shall be required on the precise points of doctrine or ritual which are involved, and that such judgment of the spirituality be made public.
8. That for the purpose of the seventh resolution the term "spirituality" be taken to mean the Upper Houses of the two convocations, assisted, if they think fit, by learned divines of the Church of England.
9. That when those who are appointed to hear the appeal are not unanimous, they shall give their opinions *seriatim*.
10. That when a clerk has been acquitted, no appeal be allowed.
11. That when on appeal to the Crown the judgment of the Church court is to be varied, the cause should be remitted to the court the judgment of which is appealed against, in order that justice may be done therein according to the order of the Crown.
12. That, in accordance with canon 122, whenever in any cause the sentence is of a spiritual character, such as exclusion from the Church, excommunication, or degradation, or of a mixed character, such as suspension *ab officio et beneficio*, or deprivation, the sentence be pronounced by the archbishop or the bishop himself in open court.
13. That it is desirable that, in addition to any statutory enactments which may be recommended, her Majesty be requested to grant to the clergy in their convocations her royal assent and license to enact such canons as may be found necessary.

Measures concerning pluralities and the union of benefices, the performance of ecclesiastical duties, the constitution and management of Queen Anne's Bounty and Patronage, were also discussed; and a large share of the attention of both bodies was occupied with the consideration of the case of the Rev. S. F. Green, Vicar of St. John's, Miles Platting, who was lying in prison for contumacy in refusing to obey an admonition of court ordering him to discontinue ritualistic practices.

At the meeting of the Convocation of Canterbury in May, a committee was appointed to make inquiries for the purpose of ascertaining the tenets and practices of the members of the Salvation Army, and to consider how far it was possible to attach that body to the

Church, and "generally to advise the clergy as to their duty in the matter."

CASE OF REV. S. F. GREEN.—The case of the Rev. S. F. Green, of Miles Platting, the clergyman imprisoned for contumacy, continued to occupy the attention of the public, the clergy, and the convocations, without developing any incidents of striking novelty. Early in the year, Mr. Green replied to a number of letters of sympathy which he had received, saying:

There are three great principles involved in our present struggle, and all alike are matters of the first consequence: 1. The rights of the Church. 2. Our rights as citizens to the benefit of the law. 3. Our rights as men to religious liberty. What the end may be we can not forecast, but surely, if we be faithful to God, the future must be in our own hands.

All hope that the Government could be induced to intervene in behalf of the prisoner under the existing conditions was cut off by the Home Secretary's replying to a request for such intervention made by some of Mr. Green's friends, that "the powers of the Crown to discharge persons from custody would not be rightly or even constitutionally exercised in the case of a person imprisoned for contempt of court, committed by a persistent disobedience to a competent tribunal." The case of Mr. Green was brought to the attention of the Convocation of Canterbury at its session in February, in the form of a *gravamen* adopted by the Lower House expressing the universal feeling of regret and uneasiness at his continued imprisonment, and praying the bishops to interfere for his release, either by memorial to the Crown, or in any other way which they might think desirable. In the discussion following the presentation of this petition in the Upper House, the Bishop of Lincoln spoke of the pain with which the whole body regarded the imprisonment of Mr. Green. The Bishop of Peterborough controverted the plea that Mr. Green was entitled to consideration because he was acting conscientiously, saying that, "if they once allowed a man to set up a plea of conscience against the authority of law, of course there was an absolute end of law. When a man sets up the plea of conscience against law, one of two things is certain to happen. The community must either feel the law to be unjust, and repeal or amend it; or, the community, considering the man's conscience ill-informed, must retain the law, and the man must suffer." He, however, condemned the manner in which the Church Association had undertaken to enforce the law, intimating that they had acted very unwisely in locking the defendant up when other remedies less violent and less liable to provoke sympathy were provided; and when by waiting three years they might have deprived the offending clergyman of his living; and insisted that the course taken by the promoters of the suit against him was diametrically opposed to the whole spirit of the Public Worship Regu-

lation Act, and almost against its letter. The Bishop of Lichfield took notice of the grave dangers involved in the continuance of the existing ecclesiastical tension. He alluded to the time when in his boyhood he had seen four hundred men come forth from the General Assembly of the Established Church of Scotland, leaving behind them their parsonages and their incomes, on a question which was almost exactly the same as in the present case, and said that:

He would be sorry to speak words of unnecessary alarm, but he feared that things might be tending toward a similar secession from the Church, or perhaps more likely to hasten disestablishment. He did not look forward to disestablishment with so much alarm as some of their lordships, but he would greatly dread a secession from the Church such as was, he believed, contemplated—perhaps more than contemplated—as possible by thousands of Churchmen. To avert such a serious issue they should exert themselves strenuously. He believed that they would be doing a good and righteous thing, even if the crown lawyers were to return the same answer, if they were to unite in memorializing the Crown. The question was ultimately one of God and Cæsar, and they would never make those who sympathized with Mr. Green think otherwise.

The Archbishop of Canterbury assented to the views of the Bishop of Peterborough as to the unwisdom of the promoters of the suit against Mr. Green, but said that it was hard to understand the defendant's scruples against obeying the law, and that he could find abundant authority in the action of his ecclesiastical superiors for observing its requirements. The discussion was ended by the adoption of resolutions:

That this House sympathizes in the general feeling of pain and disapproval with which the prolonged imprisonment of the Rev. S. F. Green is regarded; that this House is of opinion that the promoters of the suit against Mr. Green, in resorting to the older and severer process of the writ *de contumacia capiendo*, have taken a step which was in excess of the requirements of the case, and which has proved injurious to the peace and welfare of the Church; and that this House, having regard to the serious legal and constitutional difficulties in the case, regrets to feel itself precluded from approaching the Crown with a petition for Mr. Green's release.

In the Lower House of the Convocation of York, a *gravamen* was adopted as an *articulus cleri*:

That the continued imprisonment of the Rev. S. F. Green, a clergyman of this province, is a perplexity and scandal to this House and to the Church at large.

And this was supplemented by a resolution:

That the Lower House, while it does not feel called upon to express any opinion as to Mr. Green's conduct, humbly requests of the Upper House to take some united action, whether by way of an address to the Crown or otherwise as they may be advised, which may lead to the removal of this scandal, by the release of the Rev. S. F. Green.

This request was met in the Upper House simply with an exposition by the archbishop of the legal difficulties in the way of taking such action as was desired. During the discussion of the subject in the Upper House, the

Bishop of Manchester, Mr. Green's diocesan, related the history of his connection with the case, and explained his position with reference to it. Instead of the parish of St. John's, Miles Platting, being "a desert," as had been alleged, when Mr. Green came to it, it had been in charge of an excellent clergyman, and had a good congregation, though of a different kind from the one to which Mr. Green had ministered. The present congregation was not composed of parishioners, but was one which had been gathered of persons who liked the ritual. In the very year in which the proceedings against Mr. Green were commenced, far from the parish of St. John's, Miles Platting, being a scene of perfect unity and peace, he had a petition signed by 320 parishioners asking him to interfere. It was framed in loose and vague language, and contained no definite charges, and he therefore put it aside, hoping that by private influence with Mr. Green he might stop proceedings. They told him that as they were working-men, and as he refused them redress, they had no alternative but to put themselves in the hands of the Church Association. The Church Association had published a document in which they said they did not designate the three men who were selected as prosecutors, but that their names were handed to them by some of the aggrieved parishioners. At any rate, when the representation came, it was contrary to his own nature and desire to encourage these proceedings. If he could have stopped them in any legitimate way, he should have felt bound to have stopped them, but an act of Parliament having been passed which gave the aggrieved parishioners certain rights, he did not consider that he had a right as an individual, if he could offer them no redress, to step in and prevent them from obtaining their legal remedy." On the 2d of December, 1878, he wrote to Mr. Green, calling his attention to the complaints that had been made, expressing a desire to avoid litigation, and inviting him to call at the registry, examine the papers in the case, and submit to the authority of his bishop—under protest, if he preferred; else, the writer would have no choice but to allow the proceedings to go on. Mr. Green called, but refused to look at the papers, or to submit himself to his bishop, and the latter therefore felt—"though he took that step with the greatest possible pain and reluctance—that he had no alternative but to allow the proceedings to go on. He had frequent complaints—four or five—with reference to Mr. Green, between 1871 and 1881. He admonished Mr. Green in 1871, but Mr. Green did not discontinue the practice of the mixed chalice, which he mixed ceremonially, in accordance with the decision of Sir Robert Phillimore, and he (the bishop) had a letter before him in which Mr. Green said, 'I will obey your lordship's admonition.' In 1877 three charges were brought against Mr. Green of using vestments and incense. Mr. Green

then explained how he came to use them, and told him that they were introduced in 1876 without any consent on his (the bishop's) part, and without any reference to him. Mr. Green made no change in those matters, and in 1878 came a petition from 320 persons, and later still, in December, 1878, there came a representation. He had now laid the whole case before the convocation, and he asked them frankly—he was not at all afraid of what might be said, for he could justify entirely to his own conscience the course which he had taken—he asked them as Englishmen, fairly minded, whether they were not willing to make allowances for the difficulties in which a bishop was placed by a clergyman who would neither acknowledge the law of the land nor submit to his decision or advice?"

Sunday, March 19th, was the anniversary of Mr. Green's consignment to prison, and was celebrated as such with special observances and prayers in a large number of metropolitan and provincial churches. Meetings in view of its near approach were held during the week preceding the anniversary, by branches of the English Church Union and the Workingmen's Society, at which resolutions thanking Mr. Green for his consistent defense of the principles at stake, and expressing sympathy with him and with his wife and family, were passed. At the sixth anniversary of the Church of England Workingmen's Society, in August, resolutions were passed expressing indignation at the imprisonment of Mr. Green by a court of at least doubtful validity, and declaring that "Churchmen should at once make known clearly to their rulers in church and state that they can not and will not recognize the authority of Parliament, and courts created by it, to deprive a priest of the cure of souls committed to him by Almighty God, acting through the appointed ministers of his Church." A bill designed to open the way for the relief of the suffering clergyman, which had been introduced in the House of Commons, was lost. Thereupon, the Archbishop of Canterbury wrote to Mr. Gladstone, August 16th, representing to him and to the Government that the three years which the law required to elapse before an order of inhibition could operate a deprivation of the offender's benefice had that day expired, and that Mr. Green appeared to be no longer the incumbent of Miles Platting. His Grace, therefore, urged upon the Government the duty of at once putting an end to the imprisonment. Mr. Gladstone replied, promising careful consideration of the matter. On the 8th of September, the Diocesan Conference of Carlisle adopted a memorial to the Home Secretary, showing: "1. That, according to the provisions of the Public Worship Regulation Act, the Rev. S. F. Green is no longer legally incumbent of Miles Platting. 2. That, this being so, it appears contrary to all principles of justice that Mr. Green should still be kept in

prison. 3. That the Bishop of Carlisle, and the other members of the conference, would gladly learn from her Majesty's Secretary of State whether there is any reason why Mr. Green should not be set at liberty." On the 16th of September, Mr. Gladstone informed a committee of the Church of England Workingmen's Society that the matter of Mr. Green's release from imprisonment was in the hands of the Lord Chancellor, who was "most anxious to carry it through." On the 27th of September, the Archbishop of Canterbury gave to Sir Percival Heywood, the patron of the living, the formal notice required by the Public Worship Regulation Act, that the benefice of St. John's, Miles Platting, had become void, and expressed the hope that his taking this step might facilitate Mr. Green's release.

Sir Percival failed to pay any attention to this notification; but a few days afterward Mr. Green wrote to the patron from his prison in Lancaster Castle, tendering his resignation of the benefice. He also wrote to the congregation and parishioners of St. John's, stating the reasons by which he had been influenced in taking that step. Alluding to the fact that the Bishop of Manchester had made a motion in Lord Penzance's court for his release, he said that, feeling it his duty to resist the usurpations of Lord Penzance to the utmost of his power, he must deprecate the appearance of a bishop in court, even by proxy. He was, however, of the opinion that the patron of the living ought not to be permitted to embark on a new venture in disputing the legality of his deprivation, for that would entail much expense on what was probably a foregone conclusion. Lord Penzance, on the 4th of November, delivered judgment on the application of the Bishop of Manchester for Mr. Green's discharge from his imprisonment. He reviewed all the facts in the case, and said that Mr. Green could have been discharged at any time, by satisfying the contempt. The law must be obeyed, and the Court considered it had been satisfied, though not willingly, by Mr. Green. As he was no longer vicar of Miles Platting, the Court was enabled by a reasonable interpretation of the statute under which he was imprisoned to put an end to the imprisonment which Mr. Green himself seemed so little desirous of terminating. Mr. Green was accordingly released Sunday morning, November 5th, after an imprisonment of one year and ten months. The Rev. W. Ruthven Prym, curate of the parish church at Lytham, was appointed by Lord Penzance to the charge of the vacated benefice. The church-wardens, however, representing the congregation to whom Mr. Green had ministered, refused to acknowledge him, and addressed him a note informing him that they would not accept him. Subsequently the benefice was offered by the patron to the Rev. Henry Cowgill, who had been for a long time Mr. Green's curate, and was accepted by him.

CASE OF MARTIN vs. MACKONCHIE. — The

decision of the Judicial Committee of the Privy Council in the appeal case of Martin against Mackonochie was given February 3d. This was the third suit brought against the incumbent of St. Alban's, Holborn, by Mr. Martin. The first was instituted for ritualistic practices in 1867, and resulted in a monition calling upon Mr. Mackonochie to abstain from the practices complained of. The monition was disregarded, and a second suit was instituted in 1874, and Sir Robert Phillimore suspended Mr. Mackonochie for six weeks and appended another monition. The services, however, continuing unchanged, application was made to Lord Penzance, who had since become judge, and he issued a fresh monition. This was equally disregarded, and Mr. Mackonochie was then suspended *ab officio et beneficio* for three years. The Queen's Bench was then appealed to, and pronounced that Lord Penzance had exceeded his powers, and issued a writ of prohibition against him. The Court of Appeal, which was finally sustained by the House of Lords, held however that, except in respect to two points, Lord Penzance's action was right. Mr. Martin then instituted an altogether fresh suit against Mr. Mackonochie for deprivation, but Lord Penzance refused to hear it on the ground that his last judgment had not been enforced, which would have resulted in Mr. Mackonochie being sent to prison for contempt. It was against this decision that the appeal was now made to the Privy Council. The Lord Chancellor delivered the judgment of the court, which, after recapitulating the facts of the case, and stating the reasons given by Lord Penzance for his judgment, proceeded to state that from this judgment and from the reasons assigned for it their lordships found themselves compelled to dissent. They did not think that it could have been the intention of the learned judge to affirm the existence generally of a discretion in an ecclesiastical court to refuse by decree to pass any sentence of canonical censure or punishment upon a clerk in holy orders found by the same decree to have been guilty of offenses against the law, properly charged. They thought the judge had no discretion, while finding the defendant guilty of ecclesiastical offenses, to absolve him from all ecclesiastical censure or punishment for those offenses. Contempt or contumacy in another suit can not deprive the bishop (or a promoter who satisfies the bishop that there is reason for proceeding in respect of new offenses by a new suit) of the remedies given by the Church Discipline Act. Their lordships did not find that any obligation is cast by law upon the promoter of a suit in an ecclesiastical court to take proceedings for the imprisonment of a party guilty of contempt. Their lordships thought that if, as the case now stands, a more severe penalty should appear to the learned judge to be called for, he might still give the respondent one more opportunity of being

heard against such a sentence, and of submitting himself to the court and the law. Their lordships agreed with Lord Campbell's remarks in *Head vs. Saunders*, where he says that, "except under peculiar circumstances, a court of final appeal ought not to decide any cause in the first instance, as it ought to have the benefit of the discussion and judgment in the court below; and there ought not to be an original judgment pronounced from which there is no appeal." Their lordships, therefore, would advise her Majesty to reverse the sentence of the 5th of June, 1880, so far as relates to the matter complained of by this appeal, and to remit the case to the court below, to decree against the respondent such lawful and canonical censure or punishment as to that court shall seem just.

APPEAL OF REV. WILLIAM ENRAGHT.—The appeal of the Rev. William Enraght against Lord Penzance and John Perkins was decided in the House of Lords, May 22d. The appellant was the Vicar of Holy Trinity Church, Bordesley, Warwickshire, and the suit was promoted by the respondent Perkins (one of the reverend gentleman's church-wardens) on account of fourteen offenses in the celebration of divine worship, in respect of which it was alleged that the appellant had been guilty of acting illegally. The case came before the Queen's Bench division on an application for a writ of *habeas corpus* to discharge the defendant from custody for disobedience to the monition of Lord Penzance, as well as for a prohibition. The Court of Appeal allowed the discharge from custody, but refused the prohibition. Their lordships now affirmed the order of the Court of Appeal, and dismissed the present appeal with costs.

Another appeal in this case, in which the question was whether a new church-warden could be substituted for Mr. Perkins, who had ceased to be a church-warden and parishioner, as promoter of the suit against Mr. Enraght, was decided by the Judicial Committee of the Privy Council, July 4th, in favor of Lord Penzance's judgment that the substitution could not be made.

The Bishop of Winchester, in November, gave notice to the patrons of Holy Trinity, Bordesley, that under the Public-Worship Regulation Act the benefice had become vacant, the three years from the date of the monition against the vicar, Mr. Enraght, having expired. A protest signed by a considerable number of the parishioners was issued, denouncing the action taken to remove the vicar as uncanonical, unconstitutional, and cruel.

The Church of St. Vedast's, London, after having been closed for two years, on account of the ritualistic practices of the rector, the Rev. T. Pelham Dale, was reopened in September, with a new incumbent in charge.

ENGLISH CHURCH UNION.—The *English Church Union*, the most active and influential of the ritualistic organizations, had at the be-

ginning of the year 270 branches and 19,930 members and associates, having received 2,450 accessions during the preceding twelve months. The twenty-third anniversary of this society was celebrated June 10th, with special services in more than three hundred churches in London. At the regular annual meeting of the society, Mr. Wood, its president, speaking with especial reference to the case of Mr. Green, said that the Union, it must be understood, rejected the authority of the Privy Council, and of the courts subject to its jurisdiction, in spiritual matters; it maintained the integrity of the ornaments rubric, and held that the Church of England had drifted into a position where, if any reform was to be hoped for, resistance to the encroachments of the civil power had become an absolute necessity. If imprisonments had been stopped only to substitute deprivations, it must be understood that the Union would strenuously resist deprivations by civil courts.

**RITUALISTIC STATISTICS.**—The annual tables of statistics show that the number of ritualistic churches in London and vicinity is gradually increasing. According to the summaries published early in 1882, eucharistic vestments were used in 37 out of 907 churches, against 14 in 1869: incense in 10, against 8 in 1869; altar-lights in 59, against 36 in 1874; candles on the altar in 45; and the "eastward position" was taken in 270 churches against 74 in 1874. Forty-six churches had daily communion, 473 surplised choirs, and 319 free seats.

**CONTROL AND PATRONAGE.**—The annual meeting of the Society for the Liberation of the Church from the Control and Patronage of the State was held May 3d. Mr. H. R. Ellington presided. The society had distributed during the year about a million and a half of publications, and had held 368 meetings. The treasurer's receipts had been £9,759, and his expenditures £9,194. The report of the secretary, referring to general events bearing upon the objects which the society has in view, as well as upon its own particular transactions during the year, recited that among the unusual number of legislative measures dealing with the interests and position of the Church Establishments was a bill introduced by Mr. H. Richard, to simplify the law with respect to interments in cemeteries, which would remove many anomalies in the existing Burial Acts, lighten the burdens on ratepayers, and facilitate the work of burial boards. A bill had also been introduced by Mr. Brinton to reduce and equalize burial fees, and to abolish the payment of such fees except for services actually rendered. A select committee had been appointed to examine into the operation of the law of burial fees. The committee reported, with great satisfaction, that during the year the principle of religious equality had had an important extension in its application to the Universities of Oxford and Cambridge. The new statutes framed by the

universities commissioners went far to abolish clerical restrictions; and, speaking generally, the offices, honors, and emoluments of the universities and colleges would in future be conferred without reference to ecclesiastical distinctions. The three bills before Parliament dealing with the ecclesiastical and charitable endowments of London, proposed to take property which belonged to the public at large, and to devote it afresh to sectarian purposes. On the subject of church patronage, the report stated that Mr. Stanhope's bill only touched the fringe of the evil, and gave fresh legislative sanction to the rest. The society opposed that bill, but supported the measure prohibiting generally the sale both of advowsons and next presentations. The Lord Chancellor's Augmentation of Benefices Bill was open to similar objections. The committee declared their belief that it would be impossible effectually to secure church reform until by disestablishment the Church gained the power of self-government. In regard to the disestablishment of the Scotch Church, it was urged that steps in support of Mr. Peddie's motion should be taken throughout Scotland by means of petitions, etc. At home the tension in the establishment caused by the conflicting views of the different parties within it had rather increased than diminished during the last twelve months. The decision in Mr. Mackonochie's case, and the failure to obtain the release of Mr. Green from prison, had made a deep impression on the minds of those who were already chafing under the yoke of the establishment. The result had been that the principle of spiritual independence had been increasingly dwelt upon by the members of the English Church, and they were slowly coming to see that for its sake all the perils of disestablishment and disendowment might be safely encountered. The tendency of public opinion in favor of disestablishment had been strengthened by the disclosures of the recent census taken by local newspapers.

Resolutions were adopted urging the necessity of supplementing the Burials Act of 1880 by further legislation; expressing gratification at the provision in the new statutes of the universities commissioners for the abolition of clerical restrictions in connection with the headships of the Oxford and Cambridge Colleges; approving Mr. Peddie's motion relative to the early disestablishment of the Church of Scotland; and insisting that the parliamentary oath should be optional, with the provision of an equivalent alternative declaration. At a public meeting following the business meeting of the council of the society, resolutions were adopted expressing gratification at the further progress that had been made during the year toward the attainment of religious liberty at home and in the colonies, as well as at the growth of public opinion on the question of disestablishment; invoking the hearty support of the Liberal party in the House of Commons

to Mr. Peddie's motion for the disestablishment and disendowment of the Church of Scotland; and declaring that "the meeting, while sympathizing with the Episcopalians in their desire for greater liberty and for the removal of evils which now restrict the usefulness of the Church, is of opinion that that liberty can not be enjoyed, and those evils can not be effectually cured, until the Church ceases to be established by law, and becomes a self-supported and self-governed religious community."

The Executive Committee of this society, in October, issued a circular to its supporters relative to its contemplated operations during the coming session of Parliament. It anticipated that domestic questions would receive more attention than they had during the past two sessions, and that new demands for reform would exercise a stimulating influence on the public mind, and make it possible to press the subject of disestablishment with increased earnestness. Preparations were, therefore, making for greater activity. The London School Board elections would be used as a means of urging that the surplus city charities should be applied to educational instead of to ecclesiastical purposes; agitation in support of Mr. Peddie's motion for the disestablishment of the Scottish Church would be renewed; the questions of cemeteries, burial fees, and the training colleges would be dealt with; information was being collected relative to vicars' rates, church rates to repay borrowed money, and other ecclesiastical exactions, and also to the proceedings of the Charity Commissioners in regard to endowed schools. The committee stated, also, that as soon as it could do so with advantage, it would deal directly with the Establishment in England and Wales.

The annual meeting of the *Church Defense Institution* was held in June. The Archbishop of Canterbury presided, and remarked, in his opening address, that very little had been openly done during the past year to encourage an attack upon the Church of England. It was, however, to be remembered that the most dangerous periods were sometimes those when there was little outward appearance of a violent assault. He did not look with any satisfaction upon those who thought it their duty to resist all attempts at reform made within the Church herself. He hardly thought it was a fair mode of action, and was certain that those who were conscientiously desirous of seeing the Church of England with other instrumentalities in the country doing as much good as possible for the promulgation of the gospel, would not be likely to endeavor to thwart the usefulness of the Church by opposing reforms where they thought reform necessary. An impression seemed to be sometimes disseminated at meetings of the Liberation Society that the Church of England had done very little for the education of the working

classes, but he maintained that the contrary was the case.

The question of the *amendment of the system of patronage and the abolition of purchase in the Church* has been discussed with considerable interest, the discussion centering chiefly around the bills on the subject proposed in Parliament by Mr. Leatham and Mr. Stanhope. The subject was considered in the Convocation of York, at its meeting in February, in connection with a resolution offered by Canon Gore, of Chester:

That, with a view to remove abuses now incident to the sale of the right of patronage in the Church, it is expedient—(a) That the sale of the new presentation to a benefice be forbidden; (b) That an interval of not less than five years intervene between two sales of the same advowson; (c) That provision be made to prevent donative benefices from being used to create vacancies in presentative benefices; (d) That diocesan boards of patronage be incorporated, with the power of acquiring advowsons, whether by gift or purchase; (e) That all deeds affecting the advowson of a benefice be registered publicly in the diocesan registry; (f) That large additional powers be granted bishops to refuse institution to unworthy presentees.

The Central Council of Diocesan Conferences, at its meeting, March 7th, adopted a resolution declaring—

That, in view of the report of the Royal Commission of 1879, and of the decisions of diocesan conferences, the most strenuous efforts should be made to obtain the passing of an act without delay, which should enforce the principle that "patronage partakes of the nature of a trust to be exercised for the spiritual benefit of the parishioners," and should contain clauses (1) for the abolition of the sale of next presentations; (2) for the due regulation and registration of the sale of advowsons; (3) for the conversion of all donatives into presentative benefices; (4) for giving increased powers to the bishop to refuse institution in certain cases and under express limitations and conditions.

At the annual meeting of the Liberation Society, May 3d, Mr. Ellington, chairman, criticising Mr. Stanhope's measure, said that the main defect in it was, that it dealt only with next presentations and failed to touch advowsons. The society could not see that there was any material difference between presenting to the cure of souls in perpetuity and the presentation of any particular minister. A conference of clergy and laity, convened by the Council of the National Church Reform Union, met in London, June 20th, to consider the various measures on the subject which were before Parliament. Mr. Albert Grey, M. P., who presided at the meeting, said that neither Mr. Leatham's nor Mr. Stanhope's measure was adequate to meet the evil. Resolutions were adopted declaring that no reform of patronage could be regarded as satisfactory which did not confer upon the parishioners, by vote or otherwise, directly or indirectly, a voice in the choice of their clergymen; and that no dealing with the subject would be satisfactory that did not provide for its total abolition as soon as possible. Popular discontent with the system of selling advowsons and next presentations found expression on several occasions when

such franchises were offered at public sale, and the proceedings were interrupted or stopped in consequence of the demonstrations against them. A like fate attended some attempts to enforce the payment of vicars' rates by the sale of goods levied upon for the purpose.

**DIOCESAN CONFERENCES.**—The plan of holding diocesan conferences in the several dioceses, at which the clergy and laity could meet together for free, informal discussion of all questions affecting the interests of the Church, which was first started in the diocese of Bangor, has worked so satisfactorily that such conferences have now been founded in all the dioceses of England and Wales, except those of Worcester and Llandaff. The success of these meetings has suggested the establishment of some kind of connection between them, and accordingly the organization of the *Central Council of Diocesan Conferences* has been completed. The object of the organization is stated in its constitution to be "to give greater unity of action to diocesan conferences by considering, through representative members, the resolutions at which such conferences may have arrived, and other matters concerning the interests of the Church which the council may deem it expedient to suggest for discussion by the conferences; and so the general opinion of the Church at large may be obtained on matters affecting its welfare, with a view to their being brought prominently, if thought desirable, before the convocations and Parliament."

It is further provided that the action of the Central Council shall be free from political bias. The council is composed of representatives from the diocesan conferences; while other persons, though not representatives, may be present by special invitation, and speak, but not vote. At the meeting of the Council in March, when the organization was effected, representatives were present from seventeen dioceses, while the dioceses of Oxford and Rochester had not yet chosen representatives. Mr. Cecil Raikes, M.P., was chosen president of the council for the year.

A diocesan conference for the diocese of London was organized in March, and, its constitution and standing orders having been agreed upon, received the approval of the bishop in May. The conference is to consist of 102 clerical and 204 lay representatives, two of the latter—the lord-lieutenant of the county and the chancellor of the diocese—and six of the former being *ex-officio*. All clergymen in priest's orders will, under certain conditions, have a vote in the election of representatives; while the lay electorate will consist of members of the Church of England, residents or rate-payers in their respective parishes. The lay representatives in the conference must be communicants.

**THE CHURCH CONGRESS.**—The twenty-second annual *Church Congress* met at Derby, October 3d. The attendance was large, exceeding two thousand persons. The opening sermon was

preached by the Archbishop of York. The Bishop of Lichfield presided, and, in his opening address, described one of the objects accomplished by the Congress to be the bringing of the several parties within the Church into a position where they could compare their views and attain a better understanding of each other, and to prepare the way for the toleration of differences of opinion. The Church had been free from differences of opinion in no age, not even in apostolic times; and it would, in fact, "not be impossible for a scoffing spirit even to affix our modern party names to some of the apostolic writers themselves." The principal subjects discussed were: "Unity of Belief in Relation to Diversity of Thought," in connection with which a tendency toward the encouragement of greater toleration was apparent in the leading speakers; "The Church and Modern Thought," considered as to the limits of authority and free thought, the harmony of science and faith, and the dependence of morality on revelation; "The Causes and Remedies of Neglect of Public Worship"; and topics relating to the beneficed and unbeneficed clergy, home evangelization, the Church and paupers, the Church and state, the Church and laborers, the Anglican and Roman Catholic Churches, and the Church and the Nonconformists.

**IRISH EPISCOPAL CHURCH.**—A statement of the sums payable to the *Irish Church Temporalities Fund* was published in a parliamentary paper in April. The total amount payable to the fund was set down at £36,961, and was made up as follows: Tithe-rent charge, £22,932; tithe-rent charge annuities, £9,267; perpetuity rents, £884; yearly and other rents and stipends, £88; interest on simple mortgages, £1,518; land annuities, £2,049; interest on mortgages (converted leaseholds), £223.

The twelfth annual session of the *Synod of the Church in Ireland* was opened at Dublin April 18th. The report of the representative body recorded a distinct advance in financial prosperity, notwithstanding the agitation and depression of the past year. The fund devoted to parochial sustentation amounted to nearly £3,500,000; but that sum would still hardly provide £120 for each curate and less than £200 for each incumbent, while three hundred incumbents were obliged to be content with much less. The various investments of the church body were producing a total income of £280,503. A resolution was adopted expressing sorrow and shame at the wide-spread lawlessness prevailing in the country, and urging upon every one the necessity of maintaining the principles of order and good government, of justice and honesty. Much of the time of the synod was spent in the discussion of educational interests. The report of the Temperance Society showed that the whole number of members of the organization was 60,000, and that the accessions had been about 1,400.

The average income of the clergy of the

*Scottish Episcopal Church* is £209, to which may be added the rental value of the parsonage, £20. The total number of members in the Church is 67,483. The strong congregations, except those of Forfar, Johnston, and Stonehaven, are in the large cities.

**BISHOPRIC OF GRAHAMSTOWN.**—The Judicial Committee of the Privy Council gave judgment at the end of June, in an appeal from the Supreme Court of the Cape of Good Hope, respecting the *Bishopric of Grahamstown*, South Africa. The bishop, Dr. Merriman, had brought an action to enforce two decrees of suspension against Dr. Williams, the Dean of Grahamstown, for preventing him from officiating in the Cathedral Church of St. George in Grahamstown, and the colonial Supreme Court had held that it had no power to enforce the diocesan decree. The bishop thereupon appealed to the Queen in Council for a declaration of his right to exercise episcopal authority over Dr. Williams as one of his clergy and as dean. The appeal was dismissed. The grounds on which the decision of the Colonial Court, thus sustained by the Judicial Committee, was based, were as follows:

1. That bishops elected by their respective dioceses are not legally successors of the bishops formerly appointed under letters patent.
2. That there is nothing in law to prevent the Crown from sending out new bishops to supersede the elected bishops.
3. That the elected bishops have no title to the possession or use of the property formerly vested in their respective sees.
4. That consequently the civil courts can give them no protection or relief in questions relating to the use of such property (e. g., churches, parsonages, schools, etc.).

The Right Rev. A. C. Tait, Archbishop of Canterbury, died December 3d. The vacant see was offered to the Right Rev. Edward White Benson, Bishop of Truro, and was accepted by him.

**ARABI AHMED**, Pasha, was born in a little village in the province of Charkieh, in the eastern part of Lower Egypt, almost on the borders of the desert, of one of the families of the fellahs. These compose the lower laboring class. He joined the army under Said Pasha, and was brought to the camp, like all his companions, with hands fastened to a rope that held together all the young fellahs fit for military service taken by the same conscription, or draft. Said Pasha loved handsome men, and Arabi is bulky, and about five feet ten inches (*un metre quatre-vingt*) in stature; his complexion dull and yellow, like the fellahs of Lower Egypt; his figure regular, his head peaked, the forehead high and retiring, that his cap somewhat conceals; his mouth large, lips full, chin square and retiring. The features of his face express firmness, and in character he is stubborn and obstinate. His great merit is his memory, which would be regarded as rare in Europe, and is peculiar to all his kindred. He has now an expression of counte-

nance which has become habitual, and has been acquired by constant practice, and he seems to be in continued thought or reflection. Always melancholy, he has a gentle and soft look. His eyes are very beautiful, black, and surmounted with thick eyebrows. He has not a frank expression, and never looks one full in the face, but casts furtive glances without fierceness; on the contrary, they are attractive by their passiveness, and often prevent one from observing that he never looks more than a few seconds at once at the person to whom he speaks. He is very rarely moved, and speaks gently, without pressing himself, and as if he felt fatigued under the weight of business and thoughts crushing him. His walk is straight, but with a little spring, which is very common in Egypt and the East.

Said Pasha was the first to remove foreign officers from the army and fill their places with native Egyptians. Arabi was of the number, and quickly rose in rank; but, under the caprice of the Viceroy, he was soon put on half pay. He went to the university at Cairo for scientific studies. There he remained a sufficient time to appear to his companions in the army as a learned man. They esteemed him also as a person of piety and of irreproachable morals. He married the daughter of the nurse of Hamid Pasha, son of Abbas Pasha. She had been reared in the palace of the prince.

It is not known when or how he made the acquaintance of Ali Pasha, who became his intimate friend, and brought him out of obscurity. During 1876-'78, he organized a kind of secret society among the fellah officers, which, during exciting events, escaped the notice of the Khedive and his ministers. Ali Pasha was the soul of that society, which had no other object in view than the overthrow of the Khedive. They labored conjointly with bankers in Europe, without knowing the object or means used, but aided by the money and counsels of the bankers of Cairo, who had an interest in bringing about some change in the arrangements imposed on Egypt by Europe. Ali Pasha, whom they proposed to put at the head of the movement, explained it to the Khedive, who combined with them and effected the fall of the European ministry in 1879. The Khedive now made Arabi a colonel, and gave to him the command of a regiment. At this time the intrigues of the ex-Khedive, Halim Pasha, and the Porte commenced, which it is useless to describe. Each sought to control the society of officers and soldiers, which alone remained, by promises of increased pay and better treatment. It is not necessary to repeat the events which ensued until Arabi became Minister of War. He now represented the native Egyptians, who were known as the National party, and whose watchword was, "Egypt for the Egyptians." "The debt," they said, "was made by Ismail Pasha, and Egypt was not responsible; let Europe collect the debt of Ismail Pasha, whom she holds as a

hostage; so far as relates to reform courts, our institutions suffice for us; if the Europeans are not satisfied, let them go to their own courts at home."

Before he became minister, Arabi had acquired great influence in all parts of the public administration. All those who could approach him, obtained letters of recommendation, which

ARABI PASHA.

were seldom without effect. After he became minister, his hatred of the foreigners, who, he said, were ruining the country, overcame his disinterestedness. In all purchases of supplies for the army, or other objects, the preference was given to the native, even at much higher prices. In all promotions in the army his friends were advanced, and thus he acquired his strength, which was exercised to press the Europeans out of the country. In this state of affairs, England, for the preservation of the great advantages to herself of the Suez Canal, took the first step toward making Egypt a dependency of her own. (See EGYPT.)

The facts, thus far very summarily stated, are derived from a native Egyptian writer, who thus concludes his remarks: "Arabi never had any settled plan; circumstances have made him all that he is; the rôle which he has played is due entirely to the haughty jealousies and intrigues of the Western governments, consuls-general, European and native adventurers, rotten bankers and merchants of little conscience. To-day (July) the position of Arabi is such that, if he were put down, the movement he has commenced would not be thereby ended.

On the contrary, others, such as Ali Pasha el Rouby, Mahmoud Samy Pasha, Mahmoud Pasha Femi, Ali Pasha Femi, Abdulaal Pasha, Toulba Pasha, Yacoub Pasha Samy, and a hundred others, are interested to continue the movement through fear of losing the position which they have obtained, the fortune they have acquired, and even their lives. A Turk-

ish occupation would be of no advantage at present; quite the contrary, the Sultan is wholly interested in prolonging the existing state of affairs, under the hope that a European complication would leave him distinctly the master of Egypt for the future. To restore Egypt to the path of progress in which she was placed by Mehemet Ali and his successors, under the civilizing influence of Europe, a European occupation of the country is necessary, and severe punishment of all the Egyptians, whatever may be their rank in the civil or military positions, who were engaged in the late movements and events. Decimate the corps of gendarmes (*Moustah-fézines*) and the city officers who took part in the massacres at Alexandria and in all the other cities, make a general disbandment of the army, and put the officers on half pay or in retirement. Then form a corps of ten thousand gendarmes for all Egypt, commanded by officers not engaged in the recent events, honest, intelligent, and rigidly examined, and under the control of a superior council

of natives and Europeans, and in which the latter shall be a majority, under the presidency of a European commander-general, who shall receive orders directly from the Khedive for the administration of the interior police, or from the President of the Council of Civil, Judicial, and Financial Affairs. Let these measures be quickly and unhesitatingly adopted, and Arabi would be forgotten in less time than he became known." (See EGYPT.)

ARGENTINE REPUBLIC (REPÚBLICA ARGENTINA). Statistics concerning area, territorial division, population, etc., have been given in the volumes of the "Annual Cyclopædia" for 1872, 1877, and 1878. In an official estimate, the population of the republic at the end of 1880 was set down at 2,540,000; but those figures, if correctly reported, are, perhaps, somewhat exaggerated, and those given in our volume for 1881 (2,400,000) may be regarded as a closer approximation to accuracy. The population of the capital, Buenos Ayres, at the end of 1881, has recently been published at 289,925, against 177,787 in 1869, according to the census of the latter year.

The number of immigrants in 1870 was 39,-

667; in 1871, 20,928; in 1872, 37,037; in 1873, 76,332; in 1874, 68,277; in 1875, 42,066; in 1876, 30,965; in 1877, 28,798; in 1878, 35,876; in 1879, 50,205; in 1880, 41,615; and in 1881, 47,489.

The following table exhibits the nationality and number of the immigrants who landed at Buenos Ayres in 1879, 1880, and 1881:

NATIONALITIES.	1879.	1880.	1881.
Italians .....	22,774	18,416	20,506
Spaniards .....	8,422	8,112	8,474
French .....	2,149	2,175	3,612
English .....	788	588	1,149
Swiss .....	717	581	685
Germans .....	490	445	591
Austrians .....	1,760	879	495
Portuguese .....	28	84	73
Belgians .....	78	57	140
Danes .....	47	54	11
Dutch .....	7	..	10
Russians .....	15	8	34
Greeks and Turks .....	17	11	28
Americans .....	51	21	72
Various .....	364	292	648
Total .....	82,702	76,648	81,468*

The President of the Republic is Brigadier-General Don Julio A. Roca (inaugurated October 12, 1880), and the Vice-President, Don Francisco B. Madero. The Cabinet was composed of the following ministers: Interior, Dr. Bernardo de Trigoyen; Foreign Affairs, Dr. V. de la Plazar; Finance, Dr. Juan José Romero; Justice, Public Worship, and Public Instruction, Dr. E. Wilde; War and the Navy, Dr. B. Victorica.

The Argentine Envoy Extraordinary and Minister Plenipotentiary to the United States and Great Britain is Dr. Luis L. Dominguez (accredited in 1882); the Consul-General (at New York) for the American Union is Señor Don Carlos Carranza.

The Governors of the several provinces, etc., were:

Buenos Ayres .....	Dr. D. Rocha.
Catamarca .....	J. Acuña.
Córdoba .....	M. Juárez Celman.
Corrientes .....	A. Soto.
Entre-Ríos .....	Colonel J. F. Antelo.
Jujuy .....	Dr. P. Blas.
La Rioja .....	J. V. Bustos.
Mendoza .....	J. M. Segura.
Salta .....	Dr. M. S. Ortiz.
San Juan .....	A. Gil.
San Luis .....	Z. Concha.
Santa Fé .....	Dr. M. Zavalla.
Santiago del Estero .....	P. Gallo.
Tucumán .....	M. M. Nouzes.
Gran Chaco Territory .....	Colonel F. Bosch.
Patagonia .....	Colonel A. Barros.
Misiones .....	Colonel E. Roca.

The United States Minister Resident in the Argentine Republic is General Thomas O. Osborn, and the United States Consul at Buenos Ayres is Mr. E. L. Baker.

The Argentine army comprised, exclusive of the National Guard, 7,362 men, as follows: 3,710 foot; horse, 2,647; and artillery, 1,005. There were 4 generals of brigade, 14 colonels-major, 32 colonels, 147 lieutenant-colonels, 143 sergeant-majors, and 816 officers of other

grades. The National Guard was 297,384 strong.

The navy, in June, 1882, was composed of 27 vessels: 2 steam ironclads, 6 gunboats, 2 steam torpedoes, 12 steamers transformed into war-vessels, 3 transports, and 2 sail of the line, with an aggregate tonnage of 12,000, an armament of 88 guns, and manned with 2 chiefs of squadron, 5 colonels, 8 lieutenant-colonels, 6 majors, 7 captains, 26 lieutenants, 22 students, 43 midshipmen, 7 pay-masters, and 26 engineers; 900 seamen, including officers, 2,000 infantry and artillery (National Guard), 1 torpedo section comprising 3 commandants, 8 subaltern officers, and 80 privates. About the end of 1881 the number of vessels was increased by the addition of a new ironclad, the Almirante Brown, armed with six 40-pounder breech-loading guns, of new model, on automatic carriages; eight 8-inch 11½-ton breech-loading Armstrong guns, also of new model, firing projectiles of 180 pounds weight, with 90 battering charges, and a number of smaller guns. The 8-inch guns, so mounted that two can be fired straight ahead and three on each broadside, are described as surpassing in range all the guns hitherto mounted in the British Navy, and inferior to only a few in penetrative power. There is a naval school and a school for cabin-boys, and at Zárate there is an arsenal.

The national revenue and expenditure for the fiscal year 1881 have been officially reported as follows:

REVENUE.

Import duties .....	\$18,500,000
Export duties .....	3,000,000
Warehouse fees .....	350,000
Stamped paper, etc. ....	650,000
Post-Office and telegraphs .....	452,000
Light-houses, etc. ....	83,000
Railways .....	700,000
Sundries .....	1,160,000
Total .....	\$19,598,777

EXPENDITURE.

Ministry of the Interior .....	\$3,262,413
“ Foreign Affairs .....	189,920
“ Finance .....	9,576,646
“ Justice, Public Worship, Public In- struction, etc. ....	1,875,072
“ War and the Navy .....	5,482,450
Total ordinary expenditure .....	\$19,886,501

In this table the expenditure extraordinary is not included. The amount may be estimated at about \$8,000,000.

In the budget for 1882, the national revenue and expenditure were estimated as follows:

REVENUE.

Import duties .....	\$15,979,000
Export duties .....	4,006,000
Warehouse fees .....	380,000
Stamped paper, etc. ....	1,860,000
Direct taxes .....	900,000
Post-Office and telegraphs .....	650,000
Light-houses, etc. ....	46,000
Railways .....	845,000
Interest .....	116,000
Wharfage .....	12,000
Forests .....	30,000
Sundries .....	777,000
Total ordinary revenue .....	\$25,681,000

\* See President Roca's message, at the end of this article.

## EXPENDITURE.

Ministry of the Interior.....	\$4,987,795
Foreign Affairs.....	238,760
Finance.....	12,066,557
Justice, Public Worship, Public In-	
struction, etc.....	2,756,264
War and the Navy.....	6,693,837

Total ordinary expenditure..... \$26,592,713

To which is to be added:

Expenditure extraordinary.....	\$1,562,529
Grand total.....	\$28,155,242

On the subject of the national finances it would be superfluous to add any comments to the remarks contained in President Roca's message (see page 26). To the same message, and to page 28 of our volume for 1881, we would refer for details relating to the national debt.

By the terms of a law, promulgated in 1881, the duties on exports and imports were increased one per cent.

The values, sources, and destinations, respectively, of the exports and imports for the year 1881, are exhibited in the following table:

Destinations.	EXPORTS.	Values.
Belgium.....		\$13,644,951
Bolivia.....		455,341
Brazil.....		1,775,414
Chili.....		1,695,410
France.....		16,117,132
Germany.....		3,875,684
Great Britain.....		8,763,952
Holland.....		8,936
Italy.....		2,356,236
Paraguay.....		323,621
Portugal.....		27,457
Spain.....		1,228,541
United States.....		3,924,877
Uruguay.....		1,936,023
West Indies.....		985,334
South Africa.....		150,807
Other countries.....		50,211
<i>In transitu</i> .....		3,742,577
Total.....		\$56,069,104

From	IMPORTS.	Values.
Belgium.....		\$3,398,550
Bolivia.....		50,188
Brazil.....		2,588,841
Chili.....		22,805
France.....		9,948,167
Germany.....		3,413,771
Great Britain.....		15,517,979
Holland.....		450,508
Italy.....		2,724,177
Paraguay.....		967,441
Portugal.....		42,005
Spain.....		3,315,051
United States.....		4,130,421
Uruguay.....		3,161,559
West Indies.....		85,862
Other countries.....		4,175,251
<i>In transitu</i> .....		15,078
Total.....		\$54,029,649

The values of the dutiable and of the free commodities for the year above referred to were as follows, respectively:

	IMPORTS.	
Dutiable.....	\$53,022,774	
Duty free.....	1,006,875	
Total imports.....		\$54,029,649
	EXPORTS.	
Dutiable.....	\$50,722,211	
Duty free.....	5,346,893	
Total exports.....		56,069,104
Grand total.....		\$110,098,753

If to this last amount be added \$6,351,048, the value of exports *in transitu*, the total value of the foreign commerce of the republic will be raised to \$116,449,801, against \$100,563,000 for the year immediately preceding. But this increase of \$15,886,801 is merely apparent, since the value of the exports *in transitu* for 1880 was not included in the official returns for that year.

On viewing the foregoing tables of exports and imports, it is observed that the total value of the trade of the United States with the Argentine Republic is but a little over \$8,000,000, against \$80,000,000 approximately representing the value of the Argentine commerce controlled by European countries. Frequent reference has been made in these volumes to this unfavorable state of things, with explanation of the circumstances to which it is due. As the subject is one of paramount interest to the commerce of the United States, it is deemed advisable to insert here the following remarks on "European *vs.* American Trade Methods in the Argentine Republic," contained in a report transmitted by United States Consul Baker to the Department of State at Washington:

Those nations will secure the largest share (of trade) which offer the speediest and easiest facilities for effecting exchanges; that is, for transporting cargoes, disposing of them promptly, and remitting the proceeds. This is the cause of the commanding position, with reference to the commerce of the Argentine Republic, which the great maritime nations of Europe enjoy to-day. Having products to sell and products to buy, they have labored to make such traffic easy and certain. By gradual but sure methods they have laid the foundations for a fixed and permanent trade. They have arranged, as we may say, the tools and instruments by which they can handle the largest commerce with certainty and dispatch, and at the same time with profit to all through whose hands it passes. This really has been of more concern to them than idle panegyrics on the excellence or superiority of what they had to sell; for they argued, and argued correctly, that if the people of another nation have a demand for any particular article of merchandise or manufacture, they will buy it—even though its quality may be inferior—where they can procure it with the greatest ease and receive it in the quickest time. The methods employed by them thus to secure the trade of the Argentine Republic have not been secret or concealed, but are patent to us and to all the world, and may be stated in a word. They are—

1. Regular steam communication with the Argentine Republic, whereby the receipt of merchandise can be counted on to a day. This means of intercommunication is now so extended that there is hardly a day in the week that a steamer from some European port does not arrive in the River Plate. The English have six or seven different lines; the French have three; the Germans have four; the Italians have three; the Belgians have two; the Spaniards have one; and the Dutch have one, and there is not a single maritime port of importance on the coast of Europe, or in the Mediterranean, but is connected by regular steamers with Montevideo and Buenos Ayres. The stimulus and impetus which these constantly arriving and constantly departing steamships give to trade is incalculable, and it is all directed to Europe. Sailing-vessels are no longer employed, except for the heaviest freights, such as coal, or lumber, or salt, or wines. Everything in the hardware, grocery, or dry-goods line, intended for the Buenos Ayres market, comes here by steamer; and the merchant who gives the

order by cable knows that it will be delivered here in twenty to thirty days. So he is not required to keep on hand such heavy stocks, and can take advantage of the fluctuations of prices in Europe.

2. The advantage which steam communication gives to Europe in its trade with the River Plate is greatly enhanced by the fact that the mercantile firms doing business here are, as a general thing, branches of established houses in the business centers of the Old World, or are the immediate agents, if indeed not part owners, of manufacturing establishments in England and France, thus giving the parties here a personal and double interest in the orders which go forward. They are thus enabled to obtain their goods at times and in quantities to suit the trade, accompanied by the most favorable terms and credits. I have, however, in former reports referred to this fact, and it is not necessary to enlarge upon it.

3. Another and most decided advantage which Europe enjoys is its banking facilities with the River Plate. The value of these, in the conduct of general trade, can hardly be overestimated. The labor of exchange is a most important ingredient in the business of reciprocal commerce, and certainly contributes as much to its success as rapid transportation. The receiving and remitting of money and the settling of balances are thus accomplished directly, cheaply, and without trouble.

The trade of Great Britain with the Argentine Republic is especially favored in this respect, possessing banking facilities here in the River Plate of the very first class. The "London and River Plate Bank (limited)" is an institution which has been in operation here for the last twenty years, with branches in Montevideo, Rosario, and Córdoba. It has an authorized capital of \$10,000,000, of which \$7,500,000 is paid up, with a reserve fund of \$775,000. The establishment does a general banking business of all kinds, except the issuing of circulating notes, and the branch in Montevideo even has this privilege. It does a very large and successful business. I have before me the nineteenth annual report of the directors, being for the year just closed, from which it appears that after making allowances for bad debts, adding \$100,000 to the reserve fund, and paying \$43,000 for the purchase of banking-houses abroad, they have declared a dividend of 4 per cent and a bonus of 2 per cent for the last half year, being, with the *interim* dividend paid last July, 10 per cent for the year, leaving a balance of \$40,000 to be carried to the account of profit and loss for the current year.

So great has been the success of this institution that another English banking-house (the "English Bank of the River Plate, limited") has just been established here, with an authorized capital of \$7,500,000, of which \$5,000,000 is paid up. Doing business with the same facilities and on the same principles, it promises to be equally successful.

The Italians also have a flourishing bank here (the "Bank of Italy and the River Plate"). It has a paid-up capital of \$1,500,000 and a reserve fund of \$160,000. Its business has been remarkably successful, and it is now building a magnificent banking-house in this city. I have not before me its last annual report, but the dividend, after placing a large amount to the account of the reserve fund, was 10 per cent for the year. It enjoys a large share of the public confidence.

Besides these foreign banks, I would mention the Bank of the Province of Buenos Ayres, which belongs to and is the fiscal agent of the province, with branches in Dolores, San Nicolas, Chilivcoy, Mercedes, Lobos, Salto, Azul, Baradero, Chascomus, Tandil, Vienti-cinco de Mayo, San Pedro, Pergamino, Las Flores, and several other points in the province of Buenos Ayres. It has special privileges, issues bank-notes which furnish the entire circulating medium of the province and almost of the entire republic, has close and intimate connections with all the money-centers of Europe, and does a large por-

tion of the exchange business of the country, domestic as well as foreign.

The only other public bank in Buenos Ayres is the "National Bank of the Argentine Republic." It has its charter from the national Congress, and, as it has branches at the capitals of the several provinces, it is, to a large extent, the fiscal agent of the General Government. With the late money crisis in this country it was obliged to suspend specie payments, but it has since called in and redeemed all its circulation in this province. Its notes, however, still pass current in the other provinces, and furnish the circulating medium for all parts of the republic outside of Buenos Ayres. It has now fully regained the confidence of the public, and its stock sells on the Bolsa at a large per cent premium.

BANK OF THE PROVINCE OF BUENOS AYRES.

All the establishments I have mentioned do banking in all its branches. They discount bills, make loans on negotiable securities, attend to collections, receive deposits either for fixed periods or at sight, the interest on which is regulated by the market value of money; issue bills of credit to parties traveling abroad or for the purpose of purchasing goods, transfer funds, and sell exchange on the principal cities of Europe. I may state here, as a matter of some interest, that the rates at present allowed by the banks of this city are as follows: On deposits in account-current, 3 per cent; on deposits subject to thirty days' notice of withdrawal, 3 1/2 per cent; on deposits for ninety days fixed, 4 per cent; and they charge 9 per cent on debit balances in account; discounts are conventional, according to circumstances, but generally about 7 per cent.

It will be seen from the foregoing that the nations in Europe, in competing for the trade of the River Plate, have at least three very decided advantages over the United States, to wit, regular steam communication, intimate business relations, and extensive banking facilities. These are the commercial levers of the world, and place them in a position to keep the control of the commerce of the Argentine Republic, only permitting us to supply such articles as they can not furnish, such as lumber, raw tobacco, kerosene, alcohol, sugar, and a few other articles of prime necessity, and a small but uncertain trade in furniture, hardware, cottons, drugs, paints, agricultural implements, groceries, ship-chandlery, stationery, etc., mostly received on special orders.

In considering the methods by which the commerce of the United States may be promoted, I have

already in frequent reports discussed the importance of direct steam navigation with the River Plate, considering it as an essential prerequisite to the general introduction here of American manufactures, and insisting that so long as our intercourse with the Argentine Republic continues to be through the slow, uncertain, and irregular medium of sailing-vessels, we can not expect any great or decided improvement in our trade.

I have also argued the necessity of establishing more intimate relations between our manufacturers and the merchants of the Argentine Republic, explaining the impossibility of securing a permanent trade in any given commodity by means of commercial travelers, who sell by sample and have no interest in the business of those who employ them beyond the per cent they may receive on orders secured during a flying visit here; and I have suggested the wiser plan of establishing branch houses here or arranging terms with reliable houses already established; or, in lieu of this, for the manufacturers to open agencies here, where their goods will always be found on sale in stock.

**AN AMERICAN BANK WANTED IN BUENOS AYRES.**—I have not heretofore referred to the utter absence of direct banking facilities between our own and this country. There is no doubt that this is an explanation, at least in part, of the want of that activity which characterizes a healthy and satisfactory condition of trade. I believe that the establishment of an American bank here would be the means of working a change in this respect, and especially if it was accompanied by a direct line of steamships trading with the United States. It may be a question, however, whether such an institution would at once return very large dividends. There is no doubt that, if parties could afford to wait the gradual process of changing the course of trade, or rather exchange, it would ultimately not only command success, but enjoy a long life of prosperity. The great trouble in the way is the fact that all the banking business with the United States is now transacted through English banks. New York, as a financial center, is hardly known here. Credits sent out for the purchase of River Plate hides or wool, are nearly all given on London. There is scarcely a hide or a pound of wool shipped from here to the United States the invoice of which, except in the case of special purchases, is not made out to Baring Brothers & Co., or to Brown Brothers & Co., or to some other English banking-house. And all remittances on account of sales of merchandise received from the United States are made by bills on London, or by express order, put into hides or other produce, the New York or Boston account taking the chances of a profit or loss in the shipment. A bill drawn here and payable in New York for any large amount could at present with difficulty find a purchaser here, while masters of vessels in remitting home their freight-money generally take drafts on London.

Recently, however, the American houses of A. C. Bean & Co. and G. B. Perry, drawing on Boston, and S. B. Hale & Co. and C. S. Bowers & Co., drawing on New York, have been doing some exchange business, more for accommodation than anything else. The establishment of an American bank here, with strong and well-known connections at home, would gradually make a change in the present method of conducting the American trade, and ultimately be the medium through which bills for merchandise coming from the United States, as well as bills paying for produce purchased here, would pass. Bills on the United States direct would take the place of bills on London. The advantage of a central exchange office of this kind for the American trade would soon manifest itself. Sellers would know where to sell, and buyers would know where to buy; and buyers and sellers would thus be brought together. It may be argued, that the present limited trade of the United States with the Argentine Republic would hardly justify such an institution; but, if we are to have steam

communication between New York and Buenos Ayres, the commerce between the two countries will necessarily increase and become more certain. I need not state that such a modification of our tariff as would make more possible the shipment of Argentine wools—other than carpet-wools—to the United States, would give an increased stimulus to our trade with this country, and make a demand for closer banking facilities between the two; but I feel that any suggestion of this kind would be touching upon a subject which must be considered and settled, not from an Argentine but from an American point of view, it being of paramount importance that our own home interests should be taken into account, rather than those which may affect our trade with any particular country.

I may state generally that the business prospects of the Argentine Republic are in most respects more promising than they have been for years. The Argentine national Government, during the year which has just closed, has greatly strengthened its financial position, and its credit in Europe was never better than it is at present—its bonds advancing from a discount of 10 to 15 per cent to a premium on the London Exchange; while the endeavors of the Government to increase and develop the resources of the country by means of railway extensions, the selling of its public lands, the opening of new ports, the extending of its agricultural industries, the encouragement of immigration, and generally the cultivation of the arts of peace, are more earnest, persistent, and hopeful than ever before. All these things help banking operations by increasing trade and creating commerce. In the midst of this present and prospective River Plate prosperity, it would be gratifying to see a bank here, especially representing American interests, and offering increased facilities for effecting exchanges between the two countries.

No clearer delineation of the general condition of affairs in the Argentine Republic at the commencement of 1882 could be presented than that embodied in the following extract from President Rocas's message to Congress in May of that year:

**MESSEURS. SENATORS AND DEPUTIES:** I have now for the second time the honor of presiding at the opening of your annual sessions.

The republic has already begun to advance surely and steadily, without any uncertainty as to the morrow. It now knows what it requires and whither it is going; and it has made marked progress, moral and material, during the year just ended. We have been gradually acquiring self-confidence and self-security, and are now beginning to enjoy the confidence of other peoples and to attract the attention of capitalists, scientists, industrials, and statesmen, and of those nations of the European Continent where a plethora of population is felt.

Peace within our borders has not been disturbed for a single instant. The small cloud which lowered in Corrientes disappeared of itself, and the conflict subsided within the sphere of the constitutional powers of that province.

During the general elections for new deputies, and the election for two new senators in the capital, there was ardent struggling in a few provinces; but no violent demonstration of party spirit or breach of the laws occurred in any. Here we have a proof of progressive improvement in our mode of exercising our political rights.

I have been most solicitous in the preservation of peace and tranquillity, in the belief that such was the faithful interpretation of our dearest desires and the most vital necessities of our country.

While observing a policy at once firm, frank, liberal, and circumspect, the Executive has devoted his whole attention to perfecting the administration. Much has been done in this direction; much of routine has been eradicated; many costly errors have been corrected,

and considerable sums saved the national Treasury. But a great deal still remains to be accomplished, for, to place the administration on a firm footing of order and economy is not the work of a single presidential period, but of long years of peace.

The current of immigration has continued weak, as compared with the inducements and advantages offered by our country. During the past year 32,817 immigrants have landed on our shores.\* The number, without doubt, is not flattering; but we are to bear in mind that this increase of population was altogether spontaneous, and came without either effort or sacrifice on the part of the nation. We are also to consider that these immigrants are for the most part farmers who came provided with means to settle and get to work without any assistance from the public fund, and that, consequently, they have not remained in the cities as did others before them.

Although the tide of emigration from Europe is daily growing, we shall see but a slow increase, or, perhaps, rather a diminution in the number of people seeking our shores, unless we hasten to make sacrifices by cheapening the passage, placing lands within the reach of all on easy terms, and aiding the settlers for the first few months after their arrival. Besides the United States, where European immigration has reached surprising proportions, other countries of America open their doors to these feund and vivifying currents. Mexico, with her dazzling traditions, lightens their expenses by sea and land, and makes them generous grants.

Brazil continues to follow the same plan, and as soon as the Isthmus of Panama shall have been opened up, new lands, vast and fertile, and at half the distance of ours, will be offered to the immigrant.

These facts point to the necessity for us of fostering by all available means that element of power and wealth.

It is with genuine satisfaction that I am enabled here to repeat the words of my last year's message. The republic continues in peace and friendship with all the foreign powers, and cultivates its relations therewith in accordance with the principles of reciprocal kindness.

In regard to our foreign policy, the rectitude of our conduct becomes more and more marked, and the name of the republic is gaining in consideration in the eyes of other nations.

The boundary question with Chili, so long a subject of anxiety in the public mind, has been amicably settled, as you know, and our relations with that country are now completely harmonious. But on calling to your mind an event of such paramount importance for our country, I must not omit to remind you of the names of the distinguished ministers plenipotentiary of the United States in Chili and the Argentine Republic. As you are aware, the question was at the worst when these gentlemen interposed their influence for the opening up of new channels of negotiation, and continued using it until the final solution.

It is painful to me to have to announce that the question of the Pacific, in which three friendly nations are involved, still presents a character of hostility, and is enveloped in so much uncertainty as to render it impossible to foresee the issue.

In the mean time, the voice and interests of America call for peace as a supreme necessity for the common progress and prosperity. Bloodshed must not continue forever. Humanity and civilization cry aloud for the mitigation of the evils of warfare, and more particularly in the case of peoples between whom no real grounds for antagonism exist. The Argentine Government, animated by a spirit of friendship toward the contending nations, had taken steps to offer its mediation conjointly with the Government of Brazil and of the United States, should these accept the proposal, with the aim of a solution of the conflict on equitable and fitting terms. The general tenor of our

communication on the subject met the approval of the Brazilian Government. Just then, however, the United States interposed, and it was deemed prudent on our part to suspend further action in order not to interrupt the course of the negotiations set on foot.

The Argentine Government, desirous of entering into closer relations with Colombia and Venezuela, sent a minister resident to their respective governments, both of whom received him with marks of true sympathy and friendship toward our country.

We have received an invitation from the United States to the Congress which is to assemble at Washington in November of the present year, composed of two representatives from each of the nations of America, and in which will be discussed questions of the greatest moment to all those peoples.

The Continental Exhibition, due to the initiative of the Industrial Club, and which you aided with a subsidy, was solemnly inaugurated on March 15th, and I believe I may say, with genuine satisfaction, that its success has exceeded the most sanguine hopes of all concerned. The opinion of natives and foreigners has done ample justice to the indefatigable efforts of all those persons who contributed to the realization of that important competitive display; and our country may look with honest pride on the rapid improvement achieved in all branches of industry. Every country of America and many of those of Europe have been represented here in the department of machinery, and it is only to be regretted that the brief space of time allotted for the organization of the exposition did not permit of their bringing a larger number of exhibits. Nevertheless, we owe a debt of gratitude to those who so willingly, and spite of every difficulty, came forward on our invitation.

Thanks to the uninterrupted development of the country's wealth, legitimate confidence in the public tranquillity, and the faithful collection of imposts, the national income goes on progressively increasing. The revenue for 1881 was upward of twenty-three and one-half millions of hard dollars; and the receipts for the first quarter of the present year bespeak an approximation to twenty-six millions for 1882.

Our foreign trade has increased 15 per cent as compared with that for 1880, the imports having been of the value of \$54,774,204, and the exports \$56,896,194. The trade *in transitu* was of the value of \$5,860,609. Thus our foreign trade for 1881 was of the aggregate value of \$116,431,007, or \$14,245,169 in excess of that for 1880.

Eleven thousand six hundred and ninety vessels entered at our ports gave place to a movement of 2,579,361 tons of merchandise between exports and imports; and the traffic shows an increase of 336,779 tons as compared with that for 1880.

In the present year our commerce has begun under still more favorable auspices, the dutiable exports for the first quarter having been of the value of \$22,355,091, and the dutiable imports of the value of \$13,243,965. Hence, the foreign trade for the period first named has been of the aggregate value of \$35,599,056, exclusive of transit trade and commodity free of duty. For the continuance and permanence of such a flattering state of things, all that is necessary is a well-organized administration governed by prudent laws. I can not but express regret that the budget for the present year has been approved with a notable deficit as compared with the estimated amount of the revenue. For this reason, all my endeavors have tended to reduce the expenditures, without prejudice to the public service, in order that they may not be in excess of the income at the end of the fiscal year.

The foreign branch of the national debt increased by \$25,000,000 in 1881, owing to the loan negotiated for the extension of the government railways, and the two provincial loans of Buenos Ayres passed to the debit of the nation in virtue of the *Ley de la Capital*. Yet the total national debt on the 31st of last December only reached the sum of \$79,401,141, payments on

\* See p. 23.

that debt having been made in 1881 to the amount of \$3,211,449. The regularity with which the service of all our public debts has been attended to, as well as the punctual payment of the relatively high rate of interest which they bear, has kept up the most of our bonds to about par, while some of them have been and are still quoted at a premium. This flattering state of things, besides aiding us to secure the conversion of our public debt into another at a lower rate of interest and with a smaller sinking fund, will pave the way to a reduction, and ultimately to the complete abolition (our constant aim) of export duties.

In my previous message I remarked that "every effort on the part of the Honorable Congress to free the country of a forced currency would be amply repaid." Thanks to the law which you promulgated, to the decision of the Executive to remove the difficulty, to the confidence in the public peace, to the rapid development of our commercial interests now to be observed on an extensive scale throughout the country, and to the prudent measures taken by the government of Buenos Ayres, the paper of the Provincial Bank of Buenos Ayres has been at par since the 1st of December last.

Thanks to the same causes, new private banks have been established with foreign capital, while those already existing have materially improved in vitality and credit.

The creation of a national bank would not be in contradiction either to the antecedents of our country, the letter of the Constitution, or the experience which teaches us that the current of private banking institutions is as yet too feeble to carry the facilities of capital and credit to all parts of the republic.

In regard to the question of public instruction, which has been one of our chief preoccupations, I have to mention an event of importance for the future of education. A Teachers' Congress has been commenced, and is now approaching the termination of its session. To the call of the Argentine Republic prominent educationists, both foreign and native, responded cordially. Distinguished men of letters, representing the United States, Brazil, Uruguay, Paraguay, Bolivia, and the Central American republics, take their seats in the Congress as well as the most notable of our own professors. Whatever the nature of the solutions arrived at by that assembly, in regard to rules, principles, and general systems of education, the real and immediate result will be that of having brought the South American peoples together for the most noble of purposes—the education of the people, and of elevating and dignifying the men who devote themselves to the apostolate of teaching. . . .

In the belief that I have drawn a faithful and accurate sketch of the situation of the country, and the administrative movement in the year just expired, and invoking the Divine protection for your deliberations, I declare the legislative period of 1882 to be open.

JULIO A. ROCA.

BUENOS AYRES, May 12, 1882.

**ARKANSAS. STATE GOVERNMENT.**—The State officers during the year were as follows: Governor, Thomas J. Churchill (Democrat); Secretary of State, Jacob Frolich; Treasurer, William E. Woodruff; Auditor, John Crawford; Attorney-General, C. B. Moore; Superintendent of Public Instruction, J. L. Denton; Land Commissioner, D. W. Lear. Judiciary—E. H. English, Chief-Justice; W. M. Harrison and John B. Eakin, Associate Justices.

**AUDITOR'S ACCOUNTS.**—In March, 1881, charges having been made that Governor Churchill was in default in his accounts as State Treasurer, which office he had held from November 13, 1874, to January 12, 1881, the State Senate appointed a committee of investi-

gation. On the 24th of December, 1881, the committee made a statement of deficits for the purpose of giving the late Treasurer an opportunity of explanation. That statement was as follows:

Swamp land scrip .....	\$110 00
City railroad certificates .....	12,772 21
City and county bonds and coupons .....	18,164 80
County scrip .....	563 81
United States currency .....	69,742 88
State scrip .....	63,468 11

Total.....\$164,820 81

The committee remained in session, receiving such explanations as Mr. Churchill chose to give, until May 20, 1882, when its lengthy report was filed in the office of the Secretary of State. This report contains the following amended statement of deficits:

United States currency.....	\$109,888 46
State scrip.....	24,617 52
Swamp-land warrants.....	110 00
County scrip.....	563 81
County and city bonds.....	1,894 86
City interest certificates.....	2,163 62

Total.....\$139,128 27

A deficit was also shown on the part of the Auditor. Governor Churchill referred the report to the Attorney-General in a letter dated May 27th, in which he said, among other things:

Under all the circumstances surrounding this matter, I have deemed it my duty to refer this report to you, with the request that you look into the same and take such course in regard thereto as your official duty may require.

As I am personally interested in so much of the report as relates to the Treasurer's books, I take occasion to say that, while leaving to the proper tribunals to determine the committee's authority in the premises, I do, nevertheless, most solemnly protest against its mode of procedure, and allege my full confidence that when a legal investigation is had into the affairs of the Treasurer's office during my entire term of service, it will appear that all moneys for which my securities and myself were responsible have been fully accounted for according to law. A brief experience before the committee convinced my attorneys that it was due to myself and securities that I should let the committee take its own course, and await a lawful and proper investigation of my accounts as Treasurer.

**RAILROAD AID BONDS.**—In March a bill was filed in the United States Circuit Court for the Eastern District of Arkansas, in the suit of William H. Tompkins (of New York) against the Little Rock and Fort Smith Railroad Company, which raises the question of the liability of the railroad companies for the "railroad aid bonds" issued to them by the State. The complaint may be summarized as follows: 1. That the bonds were issued by the State with the distinct understanding that the roads were to pay them. 2. That, notwithstanding the road has changed its name, the liability still exists. 3. That, although the Supreme Court of the State of Arkansas has declared the act under which the bonds were issued unconstitutional, yet the roads received the bonds, sold, indorsed and received the money for them—they became commercial paper, and therefore the roads are responsible for their payment.

The railroad company entered a general de-

murrer to the bill, alleging as grounds, among others, that the present owners of the road are not liable for the payment of the State aid bonds, because they are purchasers without notice; and that the act of 1868 is void, under which the bonds were issued.

STATISTICS.—The mileage of completed railroads in the State at the close of the year was stated as follows:

*Gauge, four feet eight and a half inches—standard.*

	Miles.
St. Louis, Iron Mountain, and Southern Railroad...	465½
Little Rock, Mississippi River, and Texas Railway...	170
Little Rock and Fort Smith Railway.....	165
Memphis and Little Rock Railway.....	185
Kansas City, Springfield, and Memphis Railroad....	140
St. Louis and San Francisco Railway, about.....	100
Arkansas and Louisiana Railway.....	40
Iron Mountain and Helena Railroad.....	43
Total.....	1,262½

With narrow (or three feet and three feet six inches) gauge, there are the—

	Miles.
Texas and St. Louis Railway.....	416
Arkansas and Midland Railway.....	50
Hot Springs Railroad.....	25
Cotton-Plant and Brinkley Railroad.....	11
Searcy and West Point Railroad.....	8½
Total.....	510½
Total mileage.....	1,773

More than one fourth of this mileage is owned by the Gould syndicate. It is estimated that between three and four hundred miles additional will be completed in 1883. The Iron Mountain road enters the State near its northeast corner and passes out at the southwest. From this line the following branches have been projected: the White River Branch, starting two miles north of Newport, and running northwest through the White River Valley; the Memphis Branch, from Newport through Jackson, Cross, and Crittenden Counties; the Crowley Ridge Branch, to be extended south from Forest City, its present terminus, to Alexandria, La.; the Arkansas Valley Branch, one hundred and sixty miles long, from Beebe, White County, west to Fort Smith, crossing the Little Rock and Fort Smith road at Conway, Faulkner County; the Louisiana Branch, from Gurdon, Clark County, southeasterly, now in operation to Camden, the principal town of Southeastern Arkansas; another branch farther to the southwest, from Hope to Magnolia, Columbia County, thirty-five miles, to be extended into Louisiana.

The following table gives the population of the State by counties and race, according to the census of 1880:

COUNTIES.	POPULATION.			COUNTIES.	POPULATION.		
	Aggregate.	White.	Colored.		Aggregate.	White.	Colored.
Arkansas.....	8,085	4,971	3,067	Lee.....	18,288	4,188	9,150
Ashley.....	10,156	5,026	5,180	Lincoln.....	9,255	4,212	5,040
Baxter.....	6,004	5,959	45	Little River.....	6,404	3,064	3,335

Lawrence.....	8,732	8,315	467	Yell.....	13,852	12,733	1,113
The State.....					802,525	591,531	210,666

Included in the aggregate are 133 Chinese and 195 Indians; 416,279 were males and 386,246 females, 792,175 natives and 10,380 of foreign birth. There were living in the United States, 520,740 natives of Arkansas,

333,622 white and 137,118 colored. Of persons ten years of age and upward, 153,229, or 23·8 per cent, were unable to read, and 202,015, or 38 per cent, were unable to write, of whom 97,990, or 25·5 per cent of that class,

were native whites, and 103,473, or 75 per cent of that class, were colored. There were 136,150 white and 46,827 colored males twenty-one years of age and over. The yield of cotton, according to the census, was 603,256 bales; of corn, 24,156,417 bushels; of oats, 2,219,822; of wheat, 1,269,730. There were on farms, 146,333 horses, 87,082 mules and asses, 25,444 working oxen, 249,407 milch-cows, 433,392 other cattle, 246,757 sheep, and 1,565,098 swine. The number of manufacturing establishments was 1,202, having a capital of \$2,953,130, employing 4,556 hands; value of materials used, \$4,382,080; value of products, \$6,756,159.

**POLITICAL CONVENTIONS.**—The Christian Temperance Union of Arkansas met in Little Rock in January, and pronounced in favor of a prohibitory liquor law. A union was effected of this body with the Prohibition Alliance of Arkansas, under the name of the Christian Temperance and Prohibition Union of Arkansas.

The Democratic State Convention met in Little Rock on the 15th of June, and remained in session three days. The following is the platform adopted:

*Whereas*, In every republican form of government, having political parties, the party in power by the suffrage of the people is the one which is responsible for the public welfare; and,

*Whereas*, The Democratic party is in power in Arkansas, and the people therefore look to it to guard their interests and to take up all questions in which they are interested, and to settle them in such manner as best to subserve the public weal; and,

*Whereas*, The question of a proper disposition of our fraudulent debt, involving upward of thirteen millions of money, is one of greater magnitude and of deeper concern to the people of Arkansas, and to their children after them, than any other question that ever presented itself to their consideration: therefore,

*Resolved*, That it is the duty of the Democratic party to take up this great question, and to settle it in accordance with at once the best interests of the State and the wishes of her citizens.

*Resolved*, That it is the duty of the next Legislature to submit an amendment to the Constitution of the State of Arkansas which will forever prohibit the Legislature from the payment, compromising, funding, or otherwise recognizing the fraudulent railroad aid, levee, or Holford bonds of the State of Arkansas, or claims, or pretended claims, upon which they are based.

*Resolved*, That we demand that the State Legislature shall, at the earliest practicable period, provide for funding and paying interest upon the just debt of the State, and providing a sinking-fund to ultimately extinguish it.

*Resolved*, That we demand strict accountability of all State officers, and that all demands due the State from every officer, person, or body corporate, be speedily enforced.

*Resolved*, That we are in favor of the education of the masses by means of public schools, free to all.

*Resolved*, That we do reaffirm and approve the principles announced and promulgated by the Democratic party of the United States at Cincinnati in 1880.

*Resolved*, That we favor immigration, and recommend to the Legislature to adopt all practical means to bring labor and capital to the State.

*Resolved*, That we return thanks to the General Government for its prompt action, during the late great flood, in providing aid for the destitute and the home-

less, which, though a bounden duty to its suffering people, was made particularly gratifying in consequence of its speedy and impartial distribution.

The ticket nominated contained the following names: For Governor, James H. Berry, of Benton County; for Secretary of State, Jacob Frolich, of White County; for Auditor, A. W. Files, of Ashley County; for Treasurer, W. E. Woodruff, Jr., of Pulaski County; for Associate Justice of the Supreme Court, W. W. Smith, of Phillips County; for Attorney-General, C. B. Moore, of Pulaski County; for Chancellor, D. W. Carroll, of Jefferson County; for Chancery Clerk, J. W. Callaway, of Ouachita County; for State Land Commissioner, W. P. Campbell, of Woodruff County; for Superintendent of Public Instruction, J. L. Denton, of Phillips County; for Congressman-at-large, C. R. Breckinridge, of Jefferson County.

The candidate for Governor was born about 1840. He entered the Confederate army, and lost a leg at the battle of Corinth. He afterward taught school and studied law. In 1868 he was elected to the Legislature. In 1869 he moved to Benton County and practiced his profession with success. In 1872 he was again elected to the Legislature, and was chosen Speaker of the House at the extra session called by Governor Baxter in 1873. In 1876 he was a delegate to the State Convention, and was made chairman. In 1878 he was elected judge in the first judicial district. He was nominated for Governor by acclamation, a circumstance that had never before occurred at a Democratic Convention in Arkansas.

The Greenback State Convention met in the same city on the same day, and presented a ticket headed by Rufus K. Garland, of Nevada County, for Governor. The convention, besides adopting the usual resolutions, pronounced in favor of the Fishback amendment to the State Constitution, and of holding the election of State officers on the same day as the congressional election.

The Republican State Convention met in Little Rock on the 6th of July, and on the following day completed its ticket. One hundred and fifty delegates were present, all parts of the State being represented. Colonel W. D. Slack was nominated for Governor. The other nominees were as follows: For Secretary of State, A. A. Tufts, of Ouachita County; for County Auditor, J. M. McClintock, of Prairie County; for Treasurer, Charles A. Waterhouse, of Phillips County; for Associate Justice of Supreme Court, William May, of Yell County; for Attorney-General, Thomas Gibson, of Yell County; for Chancellor, W. A. Monroe, of Jackson County; for Chancery Clerk, J. T. Penn, of Boone County; for State Land Commissioner, John H. Johnson, of Woodruff County; for Superintendent of Public Instruction, R. H. Param, of Pulaski County. No nomination was made for Congressman-at-large, that matter being left to the

State Central Committee, which subsequently named C. E. Cunningham. The platform adopted arraigns the Democratic party for robbing the school-fund, for robbing the State Treasury of nearly \$250,000, and for various other acts entailing evil consequences.

**ELECTION RETURNS.**—At the election, on the 4th of September, the Democratic ticket was elected. The vote for Governor was as follows: Berry, 87,675; Slack, 49,352; Garland, 10,142. The vote on the liquor-license question was 78,889 for license, and 45,041 against. Only twelve counties (Ashley, Columbia, Franklin, Grant, Johnson, Logan, Madison, Marion, Pope, St. Francis, Washington, and Woodruff) voted against license. The Senate consists of 27 Democrats, 2 Republicans, and 2 Greenbackers; the House, of 78 Democrats, 13 Republicans, and 2 Greenbackers.

The following were the Democratic nominees for district Congressmen: First District, Poindexter Dunn, of St. Francis County; Second District, James K. Jones, of Hempstead County; Third District, John H. Rogers, of Sebastian County; Fourth District, Samuel W. Peel, of Benton County. They were elected on the 7th of November over their opponents. The following is the vote: First District, Dunn, 12,496; opposition, 719. Second District, Jones, 14,831; J. A. Williams, 11,475; others, 367. Third District, Rogers, 10,522; M. W. Benjamin, 7,840. Fourth District, Peel, 5,657; others, 1,240. Congressman-at-large, Breckinridge, 43,327; C. E. Cunningham, 21,394.

**MISCELLANEOUS.**—The University of Little Rock, a Methodist institution, was opened during the year. Eureka Springs has assumed importance as a health resort. In the spring the Mississippi Valley was visited by unusually destructive floods, from which the towns of Helena and Arkansas City suffered severely. A State Bar Association was organized in May. At the close of the year the new insane asylum, about three miles from Little Rock, had been completed.

**ARMY OF THE UNITED STATES.** The expenditures of the War Department for the fiscal year ending June 30, 1882, were \$45,349,319; the appropriations for the fiscal year ending in 1883 were \$55,662,420; and the estimates for the fiscal year ending in 1884 amounted to \$38,897,620. Seven thousand three hundred and forty-one enlistments had been made during the year, while 3,721 desertions had taken place. The necessity of providing some remedy for the frequency of desertions, which is not only very expensive, but is very hurtful to the morale of the Army, was apparent. The Secretary of War suggested that a partial remedy might be found in restoring the standard of pay to what it was in 1865, or to sixteen dollars a month for a private soldier, and a proportionate amount for each non-commissioned officer. The Quartermaster's Department having had a balance of \$1,705,296 at the beginning of the fiscal year, and having

received appropriations of \$11,923,385, returned at the close of the year a balance of \$1,182,239. One hundred and nineteen new buildings had been authorized, at an estimated cost of \$175,950, at military posts in twenty different States and Territories; repairs to military buildings throughout the country had cost, it was estimated, \$428,508; \$4,899 had been expended on account of buildings for school and religious purposes; and \$7,494 had been applied to the construction and repair of hospitals. The Ordnance Department had on hand 53,542 small-arms, as a reserve supply, the number showing an increase of 16,000 during the year. The Springfield breech-loading arm still continued to give satisfaction, and was believed to have no superior as a single breech-loader for troops, and to be destined to hold its place till it is superseded by a magazine-gun. The Paymaster-General accounted for the receipt and expenditure in his department of \$15,132,245, without loss, and reported that the deposit system, which had been instituted for the benefit of enlisted men, was tending to encourage habits of economy and to check desertion. During the ten years that the system had been in operation, \$3,813,081 had been deposited by the men, and \$2,766,613 drawn out by them, leaving \$1,046,468 still on deposit. The number of deaths of soldiers during the year had been 250, of which 161 were from disease, and 89 from wounds, accidents, and injuries. The whole number of deaths was equivalent to 10 per thousand of the mean strength of the force. The proportion of fatal results to cases treated was 1 to 161. The Artillery School at Fortress Monroe, and the new School of Application for Infantry and Cavalry at Fort Leavenworth, were serving a most useful purpose. Their cost is not more than that of garrisons of the same size, "and they are, in fact, only large posts, in which every officer and soldier is being, by practice, better fitted for his duties." The Department of West Point had been abolished by the operation of changes in the commands of the various departments, and the Military Academy at that place had been, at the beginning of the current academic year, restored to its former position under the law. A good account has been given of the condition of discipline in the Academy. The report of the Adjutant-General represented that interest in the militia was increasing in many States. Whenever it was requested, the Department sent officers of the Army to the State encampments, to inspect them, and afford such assistance as might properly be given. A board, authorized by a previous act of Congress, had sat for fifteen months—from July 5, 1881, to September 30, 1882—in the examination of guns, and submitted its report on the latter day. Forty guns on thirteen different systems were tested by it, and six selected from the number as best enduring the trials were subjected to severe supplementary tests. The three of the latter number that stood all

the tests most successfully and satisfactorily were recommended as suitable for the service. They are, in the order of their determined merit, the Lee, the Chaffee-Heece, and the Hotchkiss guns, and represent the different systems of the detachable and fixed magazines. Troubles with Indians have occurred during the year only in Arizona and the southwestern part of New Mexico, where the Apaches had made disturbances. The military force in the region had been increased, and no further trouble of moment was apprehended. The Secretary approved the recommendations of the General and the several Department officers, that the limit of the enlisted strength of the Army be fixed at 30,000 instead of 25,000 men, as now established, with no increase in the number of officers; that measures be taken into consideration for the erection of permanent and comfortable posts at important strategic points, to take the place of hastily and cheaply built posts, which, having served their purpose as pioneer outworks, might be abandoned; that provision be made in the Articles of War for the designation of some officer at each garrison or post to try and punish soldiers for minor offenses, so as to avoid numerous and cumbrous courts-martial; that regulations be provided for such stated exchanges of stations by regiments, that officers and men at the frontier posts may be assured that they will, in their turn, be transferred to points nearer the more thickly-settled parts of the country; that the prohibition of the payment of mileage to officers traveling on land-grant railroads be repealed; that measures be taken immediately for strengthening the sea-coast defenses of the country, and particularly for connecting torpedo-lines with the instruments, which must be placed within the fortifications on shore, used for firing them; that the strength of the Engineer Battalion be raised to 520 men; and that the Weather Bureau be made a distinct organization, separate from the Army, and maintained by separate appropriations.

**ASTRONOMICAL PHENOMENA AND PROGRESS.** DR. SIEMENS'S NEW THEORY OF THE SUN.—An interesting paper on the conservation of solar energy was read before the Royal Society of London by Dr. C. William Siemens, of England, on the 2d of March, 1882. In the May number of the "Nineteenth Century" the views of the distinguished author are stated more at length, in an article which has attracted very general attention. After pointing out the facts that the amount of heat poured down annually upon the surface of our earth is a million times greater than that producible by all the coal raised, which is estimated at 280,000,000 tons a year; that the earth intercepts only  $\frac{1}{2230000000}$  part of the heat radiated by the sun; and that, if coal were consumed in the most perfect manner at the sun's surface, the combustion of the annual produce of all the coal-mines of the earth would supply the solar radiation for no more

than  $\frac{1}{400000000}$  of a second, Dr. Siemens proceeds:

Notwithstanding this enormous loss of heat, solar temperature has not diminished sensibly for centuries, if we neglect the periodic changes, apparently connected with the appearance of sun-spots, that have been observed by Lockyer and others, and the question forces itself upon us, how this great loss can be sustained without producing an observable diminution of solar temperature, even within a human lifetime.

Among the ingenious hypotheses intended to account for a continuance of solar heat is that of shrinkage, or gradual reduction, of the sun's volume, suggested by Helmholtz. It may, however, be argued against this theory that the heat so produced would be liberated throughout its mass, and would have to be brought to the surface by conduction, aided, perhaps, by convection; but we know of no material of sufficient conductivity to transmit anything approaching the amount of heat lost by radiation.

Chemical action between the constituent parts of the sun has also been suggested; but here, again, we are met by the difficulty that the products of such combination would, ere this, have accumulated on the surface, and would have formed a barrier against further action.

These difficulties led Sir William Thomson to the suggestion that the cause of maintenance of solar temperature might be found in the circumstance of meteorites, not falling upon the sun from great distances in space, as had been suggested by Mayer and Water-ton, but circulating with an acquired velocity within the planetary distances of the sun, and he shows that each pound of matter so imported would represent a large number of heat-units, without disturbing the planetary equilibrium. But, in considering more carefully the enormous amount of planetary matter that would be required for the maintenance of the solar temperature, Sir William Thomson soon abandoned this hypothesis for that of simple transfer of heat from the interior of a fluid sun to the surface by means of convection-currents, which latter hypothesis is at the present time supported by Professor Stokes and other leading physicists.

After designating certain facts which seem opposed to the theory of Helmholtz, Dr. Siemens proposes a new hypothesis by which, he claims, the objections to the gravitation theory may be avoided, and yet the conservation of solar energy accounted for. The principal points in this hypothesis are:

1. That stellar space is everywhere filled with something more substantial than the luminiferous ether; or that hydrogen, oxygen, nitrogen, carbon, and some of their gaseous compounds, in a highly rarefied condition, are universally diffused. The existence of large quantities of matter in the inter-sidereal spaces is demonstrated, in fact, by the fall of meteors and meteoric stones.

2. The attraction of the sun is constantly producing an inward flow of this cosmical matter to the solar surface, and, as the central orb of our system rotates with a tangential velocity of 1.25 mile per second, the effect of such motion on the inflowing matter would be similar to the mechanical action of a fan, "drawing it toward himself upon the polar surfaces, and projecting it outward in a continuous disk-like stream from the equatorial surfaces."

3. During the gradual inflow of hydrogen, oxygen, and hydro-carbons, these substances

pass from their condition of extreme rarity and intense cold to that of greater compression and higher temperature, until reaching, or nearly reaching, the sun's surface, they ignite, giving rise to a great development of heat. The results of combustion—aqueous vapor and carbonic acid—will be borne by the centrifugal force toward the solar equator, and thence thrown outward into space.

4. According, then, to Dr. Siemens's hypothesis, matter is brought inward to the sun in a dissociated condition; produces intense heat by its combustion at the solar surface; is then, in a recombined state, projected into space by the centrifugal force at the solar equator, again to undergo the process of dissociation. The indefinite continuance of these alternate processes is therefore an essential postulate in Dr. Siemens's hypothesis.

The theory here outlined may yet encounter adverse criticism. The high standing, however, of its distinguished author and the ability with which his views have been presented and sustained have secured the earnest attention of the scientific public.

**SUN-SPOTS AND AURORAS.**—The number of sun-spots has been constantly increasing since 1878; and the maximum reached in 1882 has indicated an extraordinary degree of solar activity. The observations of the year have afforded, moreover, a remarkable confirmation of the theory that a connection of some kind exists between sun-spots, auroras, and terrestrial magnetism. The size of some spots seen during the year was enormous. On the 13th of April one appeared on the eastern edge of the sun which, before it reached the center of the disk, attained a magnitude nine times greater than the earth's entire surface. On the 14th of April several small spots broke out a little in advance of the great one. These rapidly increased in size, so that on the 18th three spots could be seen at the same time by the naked eye—a fact entirely unprecedented. Precisely at the time of this great solar activity—viz., April 16th—the most brilliant aurora of recent times was seen throughout the United States, while a violent magnetic storm was raging in England and over the north of Europe.

**TOTAL ECLIPSE OF MAY 17TH.**—The expedition sent to Egypt by the British Government, to observe the total eclipse of May 17th, was eminently successful. At the meeting of the Royal Society, on June 15th, Mr. Lockyer reported the results obtained by Dr. Schuster and himself, with their assistants, Messrs. Woods, Lawrence, and Black. The duration of totality was but seventy-two seconds; yet in this short time three photographs were taken which show the corona to have had the same form as that of 1871, but to have differed in appearance from those of 1878 and 1867. It was accordingly inferred that the corona varies with the sun-spots; the eclipses of 1871 and 1882 having occurred at or near the maximum of solar activity, and those of 1867 and

1878 at the minimum. The unexpected discovery of a comet close to the sun will again be referred to.

**SOLAR PHENOMENA OBSERVED AT GREENWICH.**—The new Astronomer Royal, Mr. W. H. M. Christie, presented his first annual report to the Board of Visitors on Saturday, June 3, 1882. It is stated in this report that—

The sun's chromosphere had been examined with the half-prism spectroscop on thirty-six days, and on every occasion prominences were seen. On one day a detailed examination of the whole spectrum of the chromosphere was made at twenty-four points of the sun's limb. Several prominences have shown great changes in the course of two or three minutes, and large displacements or contortions of the bright lines, indicating very rapid motions of approach or recession, have been noted. In particular, a prominence examined on May 13, 1882, was observed to rise through a space of about 30' in less than two minutes, being at the rate of one hundred and ten miles a second, while the C line showed a displacement toward the red, gradually increasing from 14 to 11.4 tenth-metres, corresponding to a motion of recession increasing in two minutes from thirty-six to three hundred and thirty miles a second.

As observed at Greenwich, the sun's disk was found free from spots on only two days during the year ending May 20, 1882.

In a communication to "Nature," dated October 5, 1882, Mr. Christie, the Astronomer Royal, gives a statement of facts in regard to the simultaneous occurrence of large and numerous sun-spots, a magnetic storm, and a brilliant aurora borealis on the 1st and 2d of October. The largest sun-spot of this date covered an area five times greater than the earth's surface.

**NEW METHOD OF FINDING THE SUN'S DISTANCE.**—Mr. T. S. H. Eyttinge, of Cainsville, Canada, has suggested a new method of determining the velocity of light, or, what amounts to the same thing, of finding the distance of the sun from the earth. The rate at which light travels has been ascertained approximately by observations of Jupiter's satellites, and also by carefully conducted optical experiments. Mr. Eyttinge proposes a third method, namely, by observations of variable stars. It is well known that certain variables of short period have regular intervals of fluctuation. If, then, these intervals be accurately determined, and also the changes produced in their values by the earth's orbital motion, we shall have the time which light requires to cross the earth's orbit. Mr. Eyttinge says he has tested his method, and that he hopes in due time to make known his results.

**PROFESSOR LANGLEY'S MOUNT WHITNEY OBSERVATIONS.**—Professor Langley's experiments at the Alleghany Observatory having rendered it probable that the amount of heat radiated by the sun had been underestimated by previous observers, it became desirable to verify these results by simultaneous observations at the base and summit of a very high mountain. Accordingly, with the co-operation of General W. B. Hazen, the head of the United States

Signal Service, an expedition for observation was sent to Mount Whitney, in the Sierra Nevada of Southern California. In "Nature" for August 3, 1882, Professor Langley, after giving an interesting account of the journey from Pittsburg to Lone Pine at the foot of the Sierras, and of the laborious ascent of Mount Whitney, makes a preliminary report of the results derived from simultaneous observations at points differing more than two miles in altitude. He says:

It appears probable that the true solar constant is one half greater than that determined by Pouillet and by Herschel near the sea-level, and even greater than the recent values assigned by M. Violle. The true value, it is believed, will be shown by the data when published to be larger than those hitherto accepted.

Of more general interest, perhaps, is the conclusion as to the limit of that cold which increases under full sunshine as we ascend above our atmosphere. "What," it may be asked, "would the temperature of the soil be on a mountain-top rising wholly above the air, or what the temperature of the sunward hemisphere of the earth, if the present absorbing atmosphere were wholly withdrawn?" The personal experiences already alluded to may prepare the general reader for the paradoxical result that, if this atmosphere were withdrawn, the temperature would greatly fall, though under a materially greater radiant heat.

The student of the subject is aware that this conclusion follows from the fact that the loss by radiation into space as the atmosphere is withdrawn is much more rapid than the gain by direct solar heat, but even he may not perhaps be prepared for the extent of the fall.

The original observations, which will be given at length, lead, in the writer's opinion, to the conclusion that in the absence of an atmosphere the earth's temperature of insolation would at any rate fall below  $-50^{\circ}$  Fahr., by which it is meant that (for instance) mercury would remain a solid under the vertical rays of a tropical sun were radiation into space wholly unchecked, or even if, the atmosphere existing, it let radiations of all wave-lengths pass out as easily as they come in. Remembering, then, that it is not merely by the absorption of our air, but by the selective quality of this absorption, that the actual surface temperature of our planet is maintained, we see that, without this comparatively little-known function, it appears doubtful whether, even though the air supported respiration and combustion as now, life could be maintained upon this planet.

These conclusions do not, in the writer's opinion, depend upon the Mount Whitney observations alone, but exist implicitly in the results of previous observers, who have, however, not apparently drawn them, with the exception, perhaps, of Mr. Ericsson, who has observed that the surface of the airless moon must remain cold even in sunshine.

We see, if these results be true, that the temperature of a planet may, and not improbably does, depend far less upon its neighborhood to, or remoteness from, the sun, than upon the constitution of its gaseous envelope, and indeed it is hardly too much to say that we might approximately indicate already the constitution of an atmosphere which would make Mercury a colder planet than the earth, or Neptune as warm and habitable a one.

It must at the same time be admitted that our information as to the special constituents of our own air, which are chiefly here concerned, is still imperfect, though the observations made at Mount Whitney upon the selective action of that undoubtedly prominent agent, water-vapor, will, it is hoped, add somewhat to our knowledge.

In the same connection it may be added that the writer's investigations have led him to the conclusion that the temperature of space, so called, must at any

rate be lower than that assigned by Pouillet (if we accept the received values for that of the absolute zero), and in this case the temperature of the earth's surface, in the absence of the quality of selective absorption in our air, will be yet lower than that here given.

AUROSAS.—Auroral displays in 1882 were more brilliant as well as more numerous than had been observed for several years. Some of the brightest occurred at the following dates:

April 16th–17th. A magnificent aurora was seen throughout the United States, whenever the sky was clear, from nine o'clock on the evening of the 16th till daylight on the morning of the 17th. The varying aspects of the phenomenon are described in the "August Observatory" by Professor Larkin, of New Windsor, Ill., who watched it from its first appearance till after four o'clock the next morning:

From midnight to 1 A. M., April 17th, the phenomenon was at its height, the whole northern heavens from the horizon to the equator being striped and banded with varying streams flashing incessantly. A wave of light would appear in the northern horizon, and instantly rush to the zenith, producing curvature in the straight columns, which at once resumed their original position when the wave passed, only to be wrought again in a few seconds.

The whole northern hemisphere quaked with the rapidity of lightning without cessation during the hour following midnight, each upheaval impelling light-emitting matter to the zenith, where it was no longer agitated, but floated slowly south. Much of this actually descended as far as Scorpio  $30^{\circ}$  south declination, so that nearly the entire celestial vault was filled with the coruscations. This unparalleled display of auroral activity was still in motion at 4<sup>h</sup> 20<sup>m</sup> A. M., when the solar rays obscured the scene. The sun-spot turbulence, the aurora, and a magnetic storm, occurring all at one time, seem to indicate a bond of union between solar and terrestrial energy, the secret of which yet eludes research. The perpetual flashing of the heavens was the most marked feature of the aurora, giving rise to a scene of appalling grandeur and sublimity.

April 17th, 6<sup>h</sup> 35<sup>m</sup> P. M. A brilliant aurora australis was seen in New Zealand. It is remarkable that this was almost, if not quite, contemporaneous with the aurora borealis above described.

May 14th, 11<sup>h</sup> 15<sup>m</sup> P. M. This display was seen in England. A very bright streamer shot up from the horizon beneath Cassiopeia, covering without hiding that constellation. Numerous white, flickering streamers extended rapidly toward the northwest, overspreading the northern hemisphere from Cassiopeia to Gemini.

May 18th, from 12 to 1 o'clock, A. M. A bright aurora was seen in Scotland.

On August 4th, from 10<sup>h</sup> 30<sup>m</sup> to 11<sup>h</sup> P. M. A fine aurora was seen in Scotland.

October 2d. A very bright aurora was seen in England on the evening of October 2d. Shortly before seven o'clock a bright arch extended along the northern horizon to a height of  $20^{\circ}$ . From this arch "remarkable outbursts of streamers" shot up at intervals toward the zenith, the most active movements corresponding closely in point of time with the violent magnetic disturbances of the same evening.

November 18th. A grand auroral display was witnessed in New York and other North-

ern States on the morning of November 13th, Mr. Brooks, of Phelps, N. Y., describes it as the most brilliant he had seen in many years. Its light was estimated as equal to that of the moon at first quarter. Streamers and auroral waves arose from the northern horizon to the zenith. A feeble aurora was also seen on the following evening.

November 17th-20th. Another extraordinary aurora was seen very generally throughout the Northwestern States and Territories on the nights of November 17th and 19th. An observer at Wooster, Ohio, who witnessed the great aurora of 1859, describes that of November 17th as surpassing it in grandeur. In Minnesota, Nebraska, Wyoming, and Dakota, the display was extremely brilliant, the brightness being greater than that of the full moon. As seen in Indiana and the adjacent Northwestern States, that on the night of the 19th was scarcely less magnificent. Its greatest brightness was between the hours of 1 and 6 A. M. In some places the light was so great that persons arose, supposing it to be daylight. The aurora was preceded and attended by a violent magnetic storm both in Europe and America. Large sun-spots—one visible to the naked eye—were seen a day or two before the aurora.

TRANSIT OF VENUS.—At the last session of Congress, a committee was appointed to take charge of all matters connected with the observations of the transit of Venus on December 6, 1882. This committee consists of the Superintendent of the Naval Observatory, the President of the National Academy of Sciences, the Superintendent of the United States Coast and Geodetic Survey, the Superintendent of the Nautical Almanac, and two professors from the Naval Observatory. An appropriation of \$85,000 was also made to meet the expenses connected with the observations. Eight stations—four in the northern hemisphere and four in the southern—were selected for the observations. Each party of observers consists of four members—a chief astronomer, a photographer, and an assistant to each. The stations and astronomers-in-chief are as follows:

STATIONS.		Chief Astronomers.
Washington, D. C.	Prof. William Harkness, U. S. N.	
Fort Thorn, N. M.	Prof. Geo. Davidson, U. S. C. & G. S.	
Cedar Keys, Fla.	Prof. J. R. Eastman, U. S. N.	
San Antonio, Texas	Prof. Asaph Hall, U. S. N.	
Santiago de Chile.	Prof. Lewis Boss.	
New Zealand.	Mr. Edwin Smith, U. S. C. & G. S.	
Santa Cruz, Patagonia.	Lieut. S. W. Very, U. S. N.	
Cape of Good Hope.	Prof. S. Newcomb, U. S. N.	

At the station last named, the sun will set with Venus on his disk, and at New Zealand, ingress will have taken place before sunrise.\*

The Executive Committee of the Royal Society of London, acting under the authority of the Treasury, have selected thirteen stations for the observation of the transit, and the governments of Continental Europe have made similar arrangements.

#### NEW DETERMINATION OF THE EARTH'S MEAN

\* This article was written before the date of the transit.

DENSITY.—A new and ingenious method of finding the earth's density has been devised and applied by Professor von Jolly, of Munich. On the top of a tower, seventy-three feet high, was placed a pair of scales. To each plate of the instrument a wire was attached which, passing through a zinc tube, reached within less than four feet of the earth. To the lower end of each wire another plate was attached, and under one of these was placed a globe of lead one metre in diameter. Bodies placed first in the upper scales, and then in the lower, had a measurably greater weight in the latter. Again, bodies weighed more or less in the lower scale, according as the leaden globe was present or absent. The differences of these weights furnished data for determining the ratio of the earth's density to that of lead. Mr. von Jolly's experiment gave a mean density of 5.692, the density of water being unity. This slightly exceeds the value obtained by Mr. Bailey.

MINOR PLANETS.—The following asteroids were discovered in 1882:

No.	Discoverer.	Where discovered.	Date.	Discoverer's No.
221	Palisa	Vienna	January 19	80
222	Palisa	Vienna	February 9	81
223	Palisa	Vienna	March 9	82
224	Palisa	Vienna	March 30	83
225	Palisa	Vienna	April 19	84
226	Palisa	Vienna	July 19	85
227	Paul Henry.	Paris	August 12	7
228	Palisa	Vienna	August 19	86
229	Palisa	Vienna	August 22	87
230	Dr. de Ball.	Bothkamp.	September 3	1
231	Palisa	Vienna	September 10	88

It is thus seen that of the eleven minor planets, discovered since January 1, 1882, the indefatigable Palisa has detected nine.

The elements of these new members of the group, so far as determined, are as follows:

No.	Mean Dist.	Period.	Eccen.	Incl.	Long. Asc. N.	Long. Per.
		Days.	° ' "			
221	3.0015	1899.4	0.1415	11 45 18	142 47 53	830 54 17
222	3.1942	2085.2	0.1715	2 6 54	78 10 15	286 46 50
223	3.1000	1998.3	0.1408	1 57 17	50 20 56	101 14 4
224	2.6432	1568.7	0.0350	5 55 52	353 30 40	273 36 20
225	3.3550	2247.5	0.2485	20 55 2	200 35 18	302 44 5
226	2.7477	1663.6	0.2214	15 48 31	185 19 40	281 32 45
227	3.1755	2069.9	0.2482	9 39 18	380 42 11	223 42 27
228	2.2030	1195.0	0.2565	2 32 49	313 15 19	380 32 57
229	3.3914	2251.2	0.1552	2 12 4	30 81 44	320 19 19
230	2.8330	1344.3	0.0539	9 28 23	239 30 12	248 58 26
231	2.9260	1830.4	0.1730	5 23 5	332 53 45	248 49 54

It is seen from this table—1. That the orbit of No. 224 is nearly circular; 2. That those of Nos. 225, 226, 227, and 228, are very eccentric; and, 3. That the perihelion distance of the last (228) is about equal to the aphelion distance of Mars.

The following minor planets have been recently named:

No. 205. Martha.	No. 214. Aschera.
" 207. Hiedda.	" 215. Enona.
" 208. Lachrimosa.	" 216. Cleopatra.
" 210. Isabella.	" 217. Endora.
" 211. Isolda.	" 218. Bianca.
" 212. Medea.	" 219. Thusnelda.
" 213. Lilaea.	

**OBSERVATIONS OF MINOR PLANETS FOR THE DETERMINATION OF THE SOLAR PARALLAX.**—A method of determining the solar parallax from observations of the interior asteroids when in opposition was proposed by Dr. Galle some years since. A series of observations to be employed for this purpose was recently arranged by Dr. Gill, the Astronomer Royal for the Cape of Good Hope. The minor planets Sappho and Victoria were favorably situated for such observations at their oppositions in 1882. In the northern hemisphere the necessary observations were made at Clinton, N. Y., Dublin, Strasburg, Berlin, Bothkamp, Leipsic, Upsala, and Moscow; and in the southern hemisphere at Melbourne, Rio de Janeiro, the Cape of Good Hope, and Natal. The number of stations south of the equator is less than in the north, but from the clearer skies of the southern hemisphere an equal number of available observations was looked for as probable. The value of the sun's horizontal parallax resulting from the observations will doubtless be made known at an early day.

Dr. Gill, it will be remembered, had previously deduced a value of the solar parallax from heliometer observations of Mars in opposition.

**OBSERVATIONS OF PROFESSOR HOUGH.**—The annual report of Professor G. W. Hough, Director of the Dearborn Observatory, at Chicago, was issued in June, 1882. The planet Jupiter has been an object of special study during the past year, as it had been, in fact, since 1879. Recent observations, it is claimed, enable us to decide definitely in regard to the motion of certain points on the disk, though the physical condition of the planet is still somewhat uncertain. The most important conclusions reached by Dr. Hough are: that the changes taking place on the planet are very slow in their operations; that the observed phenomena on the disk are probably periodical, as has been found to be the case on the sun's surface; that some of the marks or objects noticed are much more permanent in their positions than others; that at least the superficial parts of the planet are in a liquid or plastic condition; that the great red spot is not fixed as a solid portion of the planet's crust, but, on the contrary, is slowly retrograding; that the mean period of rotation between September '25, 1879, and March 29, 1882, was  $9^{\text{h}} 55^{\text{m}} 35^{\text{s}}.9^{\text{s}}$ ; that the apparent rotation period has increased about four seconds since the opposition of 1879, indicating a total drift of the red spot in longitude of 40,000 miles; and that this interesting object may be regarded as "an immense floating island 29,600 miles in length, by 8,300 miles in breadth, which has maintained its shape and size, without material change, during more than three years."

Several small elliptical white spots have been also carefully watched. Two in particu-

lar, a little south of the great red spot, were systematically observed from November 21, 1881, to February 23, 1882. The following spot of this pair was apparently at rest relatively to the red spot from November 22d to December 6th. About the latter date it commenced drifting in the direction of rotation; the total drift in seventy-nine days amounting to  $41^{\circ}$ . During the last sixty days the average motion relatively to the planet's surface was fifteen miles per hour.

The two white spots did not retain the same relative positions in longitude with respect to each other. The observations also indicate that the whole surface of Jupiter outside the equatorial belt rotates with nearly the same angular velocity. Also that these spots are not fixed, but may have a slow direct or retrograde motion. Professor Hough remarks that the observations of these spots may have an important bearing on the theory of the planet's physical condition, as well as on that of the rotation of its different parts.

There are also two principal white spots in the great equatorial belt, differing in longitude about  $15^{\circ}$ , and in latitude about  $1''$ . The rotation period for these spots has been found to be  $9^{\text{h}} 50^{\text{m}} 9^{\text{s}}.8^{\text{s}}$  or  $5^{\text{m}} 28^{\text{s}}$  less than that of the great red spot. In other words, the equatorial spots drift in the direction of Jupiter's rotation at the rate of 260 miles per hour; making a complete revolution on the planet's surface in about forty-five days. Professor Hough adds that "from observations on other small white spots, as well as on dark markings near the equator, it is probable that the matter in the equatorial regions constantly drifts in the direction of the planet's rotation; and it seems probable that the rate of this drift depends on the latitude." From all the observations we may infer that no exact period can be assigned as that of Jupiter's rotation, and that, in fact, the period varies with the latitude.

Mr. S. W. Burnham, who had been absent some months at the Washburn Observatory, Wisconsin, has returned to Chicago, and resumed his observations on double stars with the great refractor of the Dearborn Observatory. He is preparing for publication a catalogue of 151 double stars, discovered by himself during the past three years, and also a collection of all his star observations during the same period.

Professor Hough's report has an engraving of the Chicago University, showing the tower of the Dearborn Observatory, one of the 18½-inch equatorial, and twelve colored drawings showing the appearance of Jupiter's disk at different times, giving the forms, positions, and colors of the belts and spots. A comparison of these drawings shows very clearly the relative drift of the spots on the planet's surface.

**COMETS.**—The first comet of 1882 was discovered by Mr. Charles S. Wells, at the Dudley Observatory, Albany, N. Y., on the night of

March 17th. Its elements, according to Dr. H. Oppenheim, are as follows:

Perihelion passage .....	1882, June 10, Berlin M. T.	
Longitude of perihelion.....	53° 55' 25''	} Mean equinox, 1882-0.....
Longitude of ascending node.....	204° 54' 54"	
Inclination.....	73° 47' 25"	
Perihelion distance .....	6,600,000 miles.	
Motion.....	Direct.	

These elements have no decided resemblance to those of any other known comet. Spectroscopic examinations by Drs. Vogle, Huggins, Lohse, and others, gave evidence of a peculiar chemical constitution. In the "Astronomische Nachrichten," No. 2,434, Dr. Vogle remarks that "since 1864, when Huggins first analyzed the light of a comet, about twelve comets have been spectroscopically examined. The spectra of all these showed, in addition to a more or less distinct continuous spectrum, three separate streaks diffused on one side, and situated correspondingly to those in the spectra of the compounds of carbon. The completely different constitution of the present comet, the proper light of which appears principally to proceed from incandescent vapor of sodium, places it among the most interesting subjects of observation in the new department of spectrum analysis that have yet been examined." This result, however, need not seem surprising, since the spectroscopic analysis of the meteors of different streams has indicated a difference in their chemical composition.

The second comet of 1882 was observed very near the sun during the total solar eclipse of May 17th. It was seen by Messrs. Lockyer, Tacchini, Thollon, Trépiéd, and possibly others. Its brightness appeared to M. Trépiéd of the same order as that of the exterior parts of the corona. For several days after the eclipse this observer continued his search for the comet, both after sunset and before sunrise, but without success. If periodic, however, the fact may be determined by future observations, and the comet identified by tracing back its movement to the position when seen in 1882. Three photographs of the corona were taken during the totality of the eclipse. The comet is found in each of these pictures, and an exact comparison shows its distance from the sun to have been increasing. In other words, the comet had passed its perihelion.

The third comet of 1882 was discovered at Cordoba, South America, by Dr. B. A. Gould, on the night of September 6th. It was detected independently by Mr. Finlay, of the Royal Observatory, at the Cape of Good Hope, on the morning of the 8th, and four days later by Dr. Cruls, of Rio de Janeiro. In the northern hemisphere it was first seen at Reus, Spain, by M. Jaime Pedro y Ferrier, on Sunday, Sep-

tember 17th, at ten o'clock A. M. It was seen, very generally, close to the sun, by the astonished inhabitants of the village; and so great was its brilliancy that its motion could be observed through thin passing clouds. On examining it by the aid of an opera-glass with colored lenses, the tail was distinctly visible. The distance of the nucleus from the sun when first noticed was about  $1^{\circ} 30'$ . In England it was first seen by Mr. Ainslie Common, at Ealing, at  $10^{\text{h}} 45^{\text{m}}$ . Mr. Common happened to be observing the sun, when to his surprise he found a bright comet close to its margin, and apparently approaching it with great rapidity. On Monday, September 18th, it was seen in bright sunlight by many observers both in Europe and America. In the clear mountain air of Colorado and Arizona it could be followed without a telescope for several days after its discovery. Its nearest approach to the sun occurred on Sunday, September 17th, when its distance from the surface, according to Dr. Hind, was only 300,000 miles. This was the distance of its nucleus or center of gravity, and, as its envelope or coma was of considerable extent, the latter doubtless grazed the solar atmosphere. The comet's velocity in perihelion was 370 miles per second, or nearly twenty times that of the earth in its orbit. Consider-

THE COMET AS SEEN BY THE EYE AT NEW YORK.

able perturbation of the comet's motion during its perihelion passage would therefore be highly probable, and accordingly such disturbance was indicated by observation. In "Nature," for October 12th, it is said that—

At the moment when Mr. Gill observed the comet upon the sun's limb, when the distance from the sun's center was consequently  $16^{\circ} 0'$ , the orbit gives the central distance as  $10^{\circ} 9'$ , or the comet projected upon the sun's disk. Considering that Mr. Gill's observation was made less than one day previous to the accordant meridian observations at Dun Echt and Coimbra, it is not easy to see how such difference could arise from error of elements, which represent the middle position employed in their determination within a minute of arc.

Mr. Gill, in his account of the observations of September 17th, makes the interesting remark that the comet was followed by two observers with different telescopes entirely to the

sun's limb, where it suddenly disappeared at  $4^{\circ} 50'' 58''$ , Cape mean time.

Elements of the comet were computed by Professor S. C. Chandler, of Cambridge, Mass.; Dr. Hind, of London, Eng.; Mr. Corrigan, of Washington, D. C.; Professor H. A. Howe, of Denver, Col., and many others. A striking resemblance between these elements and those of the comets of 1668, 1843, and 1880, was at once noticed, suggesting the identity of the four bodies. This hypothesis was provisionally accepted by several astronomers, who accounted for the rapid shortening of the period by the comet's motion in perihelion through the corona, or the outermost strata of the solar atmosphere. Should this theory be verified, the comet's career must evidently soon terminate in a collision with the sun.

The resemblance of the elements of the comets of 1668 and 1882 is seen by the following comparison:

ELEMENTS.	Comet of 1668.	Comet of 1880.
Perihelion passage .....	1668, Feb. 28-8	1882, Sept. 17-00
Longitude of perihelion .....	$277^{\circ} 2' 0''$	$276^{\circ} 10' 45''$
Longitude of ascending node .....	$357^{\circ} 17' 0''$	$346^{\circ} 16' 00''$
Inclination .....	$35^{\circ} 58' 0''$	$87^{\circ} 54' 03''$
Perihelion distance .....	0.0047	0.0081
Motion .....	Retrograde ..	Retrograde.
Computer .....	Henderson..	Corrigan.

The similarity of elements is no less striking in the case of the comets of 1843 and 1880. Mr. Chandler, however, assigns to the comet of 1882 a period of over eight years, or more than three times the interval between the apparitions of 1880 and 1882—a fact unfavorable to the theory of identity. On the other hand, the "Astronomische Nachrichten," No. 2,430, has some new researches on the orbit of the great comet of 1880, by Dr. M. W. Meyer, of Geneva, Switzerland—researches which have an important bearing upon this question of orbital convergence. Dr. Meyer finds the period of Gould's comet (1880 I.) to be somewhat less than thirty-seven years, or equal to the interval between its own perihelion passage and that of the great comet of 1843. Dr. Meyer accordingly regards the two apparitions as returns of the same body. Professor Hubbard assigned the comet of 1843 a period of more than five hundred years. It becomes, therefore, Dr. Meyer remarks, a matter of much importance that the observations of the comet of 1843 be rediscussed, to determine whether they can be reconciled with the short period of thirty-seven years. If not, he concludes that the acceleration of the comet's motion may have been due to its passage through the sun's atmosphere.

The spectroscopic examination of Gould's comet exhibited both the sodium and the carbon lines. "The spectrum of the nucleus," says Professor Young, "consisted of a fairly bright continuous spectrum, overlaid by the usual carbon bands, and one or two lines. The D-line was distinctly seen, and seen double, but was faint and hard to catch. The fourth carbon band in the violet was also faint. The

brightest carbon band (near  $\delta$ ) was very bright and beautifully defined, showing clearly the three bright lines in it, which were seen in the great comet of 1881. A direct comparison with the blue base of the flame of a small wax-candle showed a perfect coincidence between its bands and those of the comet. No dark lines were visible in the comet spectrum. The cometary bands were easily seen all through the head of the comet, and, by opening the slit, could be traced a long distance into the tail."

The observations of several astronomers seemed to indicate that parts of this comet had become, or were becoming, detached from the nucleus. Dr. Julius Schmidt, Director of the Observatory of Athens, Greece, announced the discovery, on October 8th, of a telescopic comet only four degrees southwest of the great comet, and moving in the same direction. In the "Sidereal Messenger" for November, Mr. William R. Brooks, of Phelps, N. Y., states that while sweeping in the region of the great comet, on the morning of October 21st, he discovered a cometary mass eight degrees east of Gould's comet. Its length was about two degrees. On the 15th of October, Professor Young, of Princeton, noticed a nebulous stripe, about half a degree wide, extending from the nucleus toward the sun a distance of four degrees.

The greatest apparent length of the tail of Gould's comet was from  $15^{\circ}$  to  $18^{\circ}$ , and its true length probably about 50,000,000 miles.

In the "Science Observer" for November 15, 1882, Mr. Chandler gives elements derived from all available observations from September 18th to October 20th. The period indicated is much longer than that which he had previously calculated. The theory, therefore, that the great comet of 1882 is identical with that of 1880 has been generally abandoned.

Mr. E. E. Barnard, of Nashville, Tenn., discovered another comet on September 10th. It was circular, with some central condensation, and its light was equal to that of a star of the tenth magnitude. From the observations obtained from September 14th to October 7th, Mr. Hind, of England, calculated the following elements:

Perihelion passage, November ....	13-0067, G. M. T.
Longitude of perihelion .....	$354^{\circ} 47' 6''$
Longitude of ascending node .....	$249^{\circ} 8' 9''$
Inclination .....	$83^{\circ} 43' 1''$
Perihelion distance .....	88,000,000 miles.
Motion .....	Retrograde.

These elements have no decided resemblance to those of any other known comet.

EXPECTED RETURN OF THE COMET OF 1812.—The period assigned this comet by Bessel was 70.68 years; its return was therefore expected in 1882 or 1883. Recently, however, Professors Schulhof and Bossert have rediscussed the observations of 1812, including a series by Banplain at Marseilles, which they discovered in the original, and which were not used by Bessel. The resulting period is 73.18 years, and the most probable time of the next return, September, 1884.

# DISCOVERY AND ANNOUNCEMENT OF COMETS.

—In a statement of work done at the Harvard College Observatory during the years 1877-1882, by the director, Professor Edward C. Pickering, the following account is given of the methods adopted in the systematic search for comets, the announcement of discoveries, and the early determination of cometary orbits:

By securing the services of Mr. Chandler as an assistant, and by the co-operation of Mr. Ritchie of the "Science Observer," a scheme has been developed which has made great advance in the early announcement of comets. When a comet is discovered, notification is usually sent to this observatory by telegraph. If the discovery was made in this country, a telegram is at once sent to the Dun Echt Observatory, and thence distributed throughout Europe. The following evening, if clear, an observation of the comet is taken, and the resulting position telegraphed to Europe. These early positions have in some cases proved of great value, and have been used again and again in each subsequent orbit. Great care has been taken to avoid all delay in sending them, with the result that occasionally these precise positions have become known abroad before the discovery itself had been announced by the usual method. As soon as these observations are obtained, the computation of the orbit is begun, and the work continued at all hours of the day or night until the results have been translated into the "Science Observer" cipher and cabled. About four days after the comet is discovered its elements and ephemeris are generally printed and distributed in this country and in Europe. By an arrangement with the Signal Service and with other observatories, when cloudy weather is expected here, observations are sometimes obtained elsewhere to avoid delay. Such arrangements have been made with the daily papers and with the Associated Press, that any important observation made here before midnight would probably be printed in the papers of the following morning in the principal cities of the country.

By the same system of co-operation a plan for sweeping for comets has been developed, in accordance with which a number of observers have undertaken to examine a certain portion of the heavens once or twice every month, and satisfy themselves that no comet within the reach of their telescope is to be found there. The results published in the "Science Observer" show that the entire heavens is now so thoroughly swept that a comet is not likely to be long visible without detection.

The observers engaged in this systematic search in the northern hemisphere are Mr. T. S. H. Shearman, of Brantford, Canada; Mr. E. S. Martin, Wilmington, N. C.; Mr. A. S. Williams, West Brighton, England; M. O. Detaille, Paris, France; Dr. H. Oppenheim, Berlin; Dr. Lewis Swift, Rochester, N. Y.; Mr. E. E. Barnard, Nashville, Tenn.; Professor E. L. Larkin, New Windsor, Ill., and Mr. W. R. Brooks, Phelps, N. Y. In the southern hemisphere, Mr. John Tebbutt, of Windsor, N. S. Wales, takes the zone between the 20th and 40th parallels of latitude; Mr. A. B. Biggs, of Launceston, Tasmania, from the 40th to the 60th; and Mr. W. Bone, of Castlemaine, Victoria, from the 60th to the 80th.

METEORIC SHOWERS.—The meteors of April 20th were more numerous than usual in 1882. Mr. H. Corder, of England, watching from 9<sup>h</sup> 30<sup>m</sup>. to 12<sup>h</sup> 30<sup>m</sup>., counted thirty-four me-

teors, of which twenty-six were conformable to the radiant in Lyra. Mr. Corder, who has given attention to the meteors of this stream for the last six years, found the hourly number twice as great in 1882 as in any other year since 1876. Four of the meteors were equal to stars of the first magnitude. The radiant point was near Theta Lyrae, in right ascension 268°, and north declination 37°.

The meteors of the August shower were much more numerous in some localities than in others. In "Nature," for September 28th, Mr. Donald Cameron, of Glasgow, Scotland, gives the result of his observations from the 6th to the 11th of August inclusive. The showers witnessed on the nights of the 9th, 10th, and 11th, are described as "gorgeous." On the evening of the 10th, before the close of twilight, he counted thirteen very large meteors in the space of a few minutes, although his view was much intercepted by trees and buildings. Mr. Cameron does not give the whole number observed, but he remarks that he had not for years during any month witnessed so grand a display of meteors as in August, 1882. The shower "was of very short duration on each night, and after twelve o'clock not one scarcely could be seen."

According to the "Sidereal Messenger," for October, 1882, watch was kept for the August meteors at several points in Indiana on the nights of the 8th, 9th, 10th, and 11th. At Bloomington, on the night of the 10th, a party of four, under the direction of Professor D. E. Hunter, counted 521 meteors in four hours, commencing at 10<sup>h</sup> 30<sup>m</sup>. This was an average of 130 per hour. Of these, 139 were estimated as of the first magnitude, 99 of the second, and 76 of the third. A stationary meteor was seen at 1<sup>h</sup> 34<sup>m</sup>., which increased from the fourth to the first magnitude. This, of course, was at the point of divergence, and moving directly toward the observers. A bluish Perseid of the first magnitude appeared in Draco at 1<sup>h</sup> 33<sup>1</sup>/<sub>2</sub><sup>m</sup>., and moved in a track apparently curved. In a second or two this was succeeded by another, of nearly the same size and color, which moved in precisely the same path. The meteors frequently came in clusters, five or six sometimes appearing in quick succession. At other times a lull or total cessation would last several minutes.

In one hour—from eight to nine—on the evening of the 10th, Mr. W. F. L. Sanders, watching alone at Jasper, Dubois County, observed forty meteors.

At Bloomfield, Greene County, Ind., Dr. H. R. Lowder and others kept a continuous watch on four nights, commencing at nine o'clock on the evening of the 8th. The observers counted—

On the night of the 8th.....	761 meteors.
" " " 9th.....	1,527 "
" " " 10th.....	3,677 "
" " " 11th.....	667 "
Total in four nights.....	6,632 "

At Cambridgeport, Mass., where watch was kept by Mr. E. F. Sawyer, the number of meteors observed was not extraordinary. The night of the 10th, however, was quite overcast, and those of the 9th and 11th were more or less cloudy.

**METEORS OF OCTOBER 20th.**—At Washington, Ind., on the morning of October 20th, thirty meteors were counted by Professor D. E. Hunter, from 4<sup>h</sup> to 4<sup>h</sup> 30<sup>m</sup>. Twenty-three of this number had their radiant in Gemini.

**METEORS OF NOVEMBER 14th.**—On the morning of November 14th, Mr. D. E. Hunter, Principal of the Washington High-School, Washington, Ind., watched for meteors from 3<sup>h</sup> 10<sup>m</sup> to 5<sup>h</sup> 11<sup>m</sup>. The number seen in successive half-hours was as follows:

	Leonids.	Sporadic.	Total.
From 8h. 10m. to 3h. 40m. ....	14	15	30
" 3 40 " 4 10 .....	16	9	25
" 4 10 " 4 40 .....	4	4	8
" 4 40 " 5 11 .....	14	7	21
Meteors in two hours. ....	48	36	84

During the first hour Mr. Hunter had four assistants, and during the second three. The visible paths of the Leonids were unusually short—thirty not exceeding 10° in length. The morning of the 15th was cloudy.

**LARGE METEORS.**—Meteoric fire-balls were observed during 1882 at the following dates:

March 9th, at 11<sup>h</sup> P. M. This meteor was seen by a party of five gentlemen about eight miles northeast of Warsaw, Kosciusko County, Ind. The sky was entirely covered with clouds, and snow was rapidly falling. Consequently the meteor could not be seen till it had passed below the clouds. The report of its explosion was distinctly heard at Warsaw, the county-seat, and excited much attention, from the fact of its occurring during a heavy snow-storm.—(*Observatory*, July, 1882.)

March 12th, 8<sup>h</sup> P. M. A large, violet-colored meteor was seen near Haren, Netherlands, in the southwest.

March 18th, 1<sup>h</sup> A. M. A large, detonating meteor was seen near Groningen. On the same night, and at the same hour, another fire-ball was observed near the village of Bergen, in North Holland.—(*Nature*, July, 1882.)

March 12th, 9<sup>h</sup> 25<sup>m</sup>, P. M. A very brilliant fire-ball was seen at Cambridge, Mass. It appeared near the zenith, and vanished at an altitude of 65°, its course being from southeast to northwest. It consisted of two nuclei, one following the other.—(*Science Observer*, July, 1882.)

May 4th, 9<sup>h</sup> 31<sup>m</sup> P. M. A meteor "as brilliant as the full moon" was seen at Stonyhurst Observatory, and at other points in England. It appeared near Arcturus, and moved through Ursa Major, passing between the stars Delta and Epsilon. It was visible five seconds.—(*Nature*, June 8th.)

May 16th, 11<sup>h</sup> A. M. A large meteor was

seen at the University of Oxford, England. It appeared 5° above the main cluster of *Coma*, passed a little above Iota, in the Great Bear, and vanished 5° to the left of Beta Aurigæ; time of flight between eight and ten seconds. A few minutes later another was seen, describing very nearly the same path.—(*Nature*, May 25.)

June 24th, 9<sup>h</sup> 33<sup>m</sup>. A magnificent meteor was observed by many persons at Wilmington and other points in North Carolina. It exploded with a loud detonation over Lenoir County.

September 3d, at 9<sup>h</sup> 10<sup>m</sup> P. M. A large meteor was seen by H. Corder, of Great Baddow, England. It appeared "just below Lacerta, and, passing Polaris, disappeared with a flash near the tail of Draco."

September 10th. At 8<sup>h</sup> 25<sup>m</sup> P. M., Messrs. O. and E. Corder saw from the cliff of Lowestoft, England, a meteor which seemed to start in the east from a point about 20° above the horizon and move to the zenith, where it exploded. The head was pear-shaped and nearly as large as the moon.

**VARIABLE STARS.**—In the "Science Observer," No. 35, December 15, 1881, Mr. Edwin F. Sawyer, of Boston, announced the discovery of a new variable. Its position for 1882.0 is right ascension 17<sup>h</sup> 10<sup>m</sup> 33<sup>s</sup> declination 1° 20' 36" north. The character of its variations assigned it to the small but very interesting class of short period variables of which Algol is the type; the period, according to Mr. Sawyer's observations, being about five days and six hours. The same journal for July 12, 1882, contains the result of late observations of the same star by Mr. S. C. Chandler, of the Cambridge (Mass.) Observatory. Mr. Chandler has demonstrated that the period is but 20<sup>h</sup> 7<sup>m</sup> 42<sup>s</sup> instead of 5.24 days, and that all the variations take place in one fifth of this time, or in about four hours. "In several respects, Mr. Sawyer's star ranks as the most remarkable in the list of known variables. Its period is the shortest of any, and very much shorter than any of the peculiar class to which it belongs, known as the Algol type. Not only this, but the portion of its period to which the variations are confined is also far the shortest of any."

The "Observatory," for March, 1882, contains a second paper by Mr. T. E. Espin on the distribution of the variable stars. In his former paper on this subject it was shown that the variables are confined for the most part to a well-marked zone inclined 15° or 20° to the equator. His later discussions furnish some remarkable conclusions in regard to the periods of variation. Thus "if we tabulate the number of stars in each ten days up to periods of 440 days, we find—

"1. There are no stars with periods between 71 and 135 days.

"2. No such gap occurs elsewhere, nor is there any sign of such.

"3. The number of stars decreases rapidly on one side of the gap, and increases on the other side of the gap."

Calling the stars with periods less than 71 days Class I, and those on the other side of the gap (that is to say, with periods greater than 135 days) Class II, Mr. Espin has found, from a careful consideration of the phenomena of the variable stars in Class I, that when the variation is small, or when the variable at its maximum is bright, the period is generally short. These facts, he remarks, may be of service in observing stars suspected of variation.

**NEW PLANETARY NEBULÆ.**—The "Observatory," for October and November, gives the positions of twelve small planetary nebulæ recently discovered by Professor Pickering. It is a remarkable fact in regard to these objects that they are all found in or near the Milky Way.

**OBSERVATORIES.**—**WASHBURN OBSERVATORY OF THE UNIVERSITY OF WISCONSIN.**—The first volume of the publications of this observatory was issued in October, 1882, by the director, Professor Edward S. Holden. It contains a description of the observatory buildings and instruments; a catalogue of 195 stars, reduced by Mr. G. C. Comstock, assistant in the Washburn Observatory; reduction tables for the latitude of Madison; a list of 27 new nebulæ discovered in the zone observations at the Washburn Observatory, from April 23 to September 30, 1881; a list of 60 new double stars discovered in the zone observations by Professor Holden; a list of 88 new double stars discovered by Mr. S. W. Burnham; measures by Mr. Burnham of 152 selected double stars; observations of 84 red stars, and a list of 27 new red stars; and observations and drawings of the great comet of 1881.

**THE LEANDER MCCORMICK OBSERVATORY OF THE UNIVERSITY OF VIRGINIA.**—Professor Ormond Stone, late of Cincinnati, having been appointed director of this observatory, commenced the duties of his new position in the summer of 1882. The great refracting telescope, made by Messrs. Alvan Clark and Sons, of Cambridge, Mass., for Mr. McCormick a few years since, has been presented by that gentleman to the University of Virginia. This instrument, which cost \$50,000, is not surpassed in this country, and is equaled only by the 26-inch refractor of the Naval Observatory at Washington. It is understood also that the chair of Astronomy has been liberally endowed by the friends of the university. From the great power of the instrument, its favorable position, and the recognized ability of Professor Stone, astronomers may anticipate important results.

**THE PRINCETON TELESCOPE.**—This instrument, now mounted and ready for use, ranks as the second in magnitude of the great refracting telescopes in the United States. Its object-glass is twenty-three inches in diameter

—only three inches less than that of the great equatorial of the Naval Observatory at Washington. This glass is peculiar in its form, consisting of two lenses separated by an interval of about seven inches. The free circulation of air through this vacant space will diminish the disturbance resulting from a change of temperature. The instrument, which is provided with all necessary appliances, will be chiefly used by Professor Young, the distinguished director, in the department of stellar spectroscopy. The spectroscope, the most powerful of its kind ever constructed, was made by Hilger, of London, under the supervision of the Astronomer Royal. The whole cost of the equatorial and spectroscope was \$26,000.

In the summer of 1882 the Yale College Observatory received its new heliometer, regarded as the most perfect micrometric apparatus in either Europe or America. This instrument, as well as the equatorial recently purchased, was expected to be in readiness for observing the transit of Venus on December 6th. The Lick Observatory, on Mount Hamilton, California, has received a sidereal clock from Hohwu, of Amsterdam, and the observatory buildings are in the process of erection. The Warner Observatory, Rochester, N. Y., was completed in 1882. Its new telescope, a sixteen-inch refractor, has been received and mounted. In the hands of Dr. Swift, the director, it may be expected to perform good service.

**NEW ASTRONOMICAL JOURNALS.**—Professor William W. Payne, director of the observatory at Northfield, Minn., has commenced the publication of a new astronomical periodical entitled "The Sidereal Messenger." The journal is issued monthly, except for July and August. It is popular rather than technical, giving the results of observation and research both in Europe and America.

M. Flammarion, of Paris, well known for his numerous works on popular astronomy, commenced the publication of a new journal under the title of "L'Astronomie," in March, 1882. It is a monthly review of astronomy, meteorology, and physiography, each number containing forty pages, large quarto, with numerous woodcuts. The first number contains an interesting account of the Paris Observatory.

**ASTRONOMICAL PRIZES.**—The gold medal of the Royal Astronomical Society of London was awarded in February, 1882, to Dr. David Gill, Astronomer Royal at the Cape of Good Hope, for his heliometric observations of Mars at ascension, and for his discussion of the results. The president, J. R. Hind, Esq., laid before the society the ground on which this award had been founded. The Lalande prize of the French Academy of Sciences was awarded to Dr. Lewis Swift, Director of the Warner Observatory, Rochester, N. Y., for his discovery of seven comets in four years, one of

them belonging to the group of periodic comets having their aphelia in the vicinity of Jupiter's orbit. The prize offered by H. H. Warner, Esq., of Rochester, N. Y., for the best essay on comets, their composition, purpose, and effect upon the earth, was awarded to Professor Lewis Boss, Director of the Dudley Observatory, Albany, N. Y.

**AUSTRALIA AND POLYNESIA.** The Australasian colonies resemble each other greatly in their public policy and their economic conditions, which are not seriously affected by the rivalry between high and low tariff carried on by the two leading colonies. Their policies differ only in degree, and have a prospect of becoming assimilated. The proposal of an Australian Federation has been revived in the Victorian Legislature. In spite of the boundless prosperity of Australia and the high rates of wages now prevailing, the bone and sinew of British immigration is drawn toward the more liberal institutions of the United States, while farmers with large capital are naturally attracted by the splendid opportunities of these colonies.

**REVENUES.**—The financial budgets of all the colonies for 1882 show revenues greatly exceeding the estimates. The revenue of New South Wales for the year ending June 30th was £7,213,000, an increase of a million over that of the previous year. That of Victoria was £5,750,000, being £316,000 above the estimate. The revenue of South Australia was £2,225,000, an increase of £175,000. That of Queensland was £2,100,000, showing an increase of £331,000, and leaving a surplus of £245,000. The redundant revenues which place these progressive young commonwealths in a financial position altogether exceptional are due to the supplementary income from sales of public lands. Yet the present augmentations in the public income are not attributable to forcing the land-sales, but to the increased consumption of articles paying custom and excise duties, and to increased traffic on the Government railroads. Severe droughts affected nearly the whole surface of the Australian Continent in the beginning of the year. The wool-crop in consequence showed very little, if any, increase over the preceding year. But, notwithstanding the losses from this cause, and the partial failure of the wheat-crop in South Australia in 1881, the general tide of prosperity has continued to rise. When the surface of Western Australia, which is rapidly filling with squatters, is as completely occupied as the Eastern colonies now are, the limit will be reached of Australian wool production under present conditions and at present prices. New South Wales and New Zealand have added to their large public debts by contracting new loans, which they have obtained on favorable terms in London. The agreement of the colonies to exercise common federal action can not be consummated while Victoria and New South Wales maintain their rival commercial

policies. But the abandonment of the restrictive tariff of Victoria seems only a matter of time, since a respectable number of the manufacturers have joined with the merchants and farmers in condemning the tariff. The protective policy vehemently championed by Graham Berry, the former Prime Minister, and leader of the Democratic party, still finds strong support among the laboring classes. The primacy among the colonies would be regained by New South Wales without the advantage of freer commercial intercourse with other countries, because that colony possesses a vast area of agricultural land, a central geographical position, and coal and the useful metals as well as gold.

**RAILROADS.**—The progress of Australia depends upon the extension of railroad communications, so that politics and finance center in the railroad policy of the colonies. In constructing state lines with capital mostly raised by public loans, the colonies do not have to look to remote returns in the increase of the taxable capacity of the country. The railroads thus far constructed pay a fair interest on the investment, and add greatly to the assets of the Government by rendering the public lands immediately valuable. The eighteen millions thus invested in Victoria yield  $4\frac{1}{2}$  per cent net per annum. That province has authorized the construction of 850 miles more. New South Wales has built over a thousand miles of railroads, and receives from them an income of 4 per cent on the expenditure. Queensland and South Australia have each laid out about 700 miles of railroads and several thousand miles of telegraphs. The railroad debts of the colonies are lightly borne; the railroads themselves usually yield the interest. New South Wales pays the interest of £766,000 on the public debt with the eighth part of its revenue. This colony has authorized £15,500,000 of new loans since 1879, which nearly double its debt. The Earl of Denbigh's projected railroad through fertile, well-watered, and rich mineral regions in the interior of Queensland to connect Sydney with Brisbane, was opposed by the Governor, who objects to signing away the valuable land-grants demanded, and is still in abeyance. South Australia is more favorably disposed to land subventions, and has entertained the project of a company to construct a line 1,900 miles long, following the line of the Government telegraph put up in 1881, directly across the continent from Adelaide to Port Darwin. It is a question whether this bold project shall not be carried out by the Government instead of the company. It has 400 miles of the proposed line, from Adelaide to the new town of Farina in the 30th degree of latitude, already built. The railroads which are now being constructed by New South Wales westward to the Darling River, southward to meet the railroads of Victoria, and northward in the direction of Brisbane, and the road which South Australia is pushing

toward Melbourne, promise to soon bring the four capitals of the leading provinces into direct railroad communication with each other.

**PUBLIC LANDS.**—The Australian colonies have pursued a policy with regard to the public domain widely divergent from that of the United States. While keeping the land out of the hands of speculators almost as effectually, their system has encouraged instead of preventing extensive agriculture and the formation of large estates. The agriculture of the country might have been more varied under the American homestead system, instead of being confined to stock-raising, and the ultimate social results might be better; but such a rapid production of wealth and such immediate economical progress would have been impossible.\*

The Australian policy is for the state to retain the lands until they attain a commercial value, and meanwhile to lease them out on terms long enough and at rents low enough to attract settlers. This plan has been really more advantageous for the sheep-growers, who were thus enabled to put more capital into stock, so that many of them are rich in flocks and in money from the sale of the produce, and are able at the expiry of their licenses to buy the land from the Government at good prices. The inflow of public money from a source possessed by no other states old or new, and one quite independent of the taxable resources of the people, was likely to lead to an embarrassment of riches if the fortunate colonies had not adopted the plan of building railroads in advance of private enterprise. The construction of a railway net-work to connect the prosperous but scattered settlements of this vast continental island is not only good public policy, but under honest control, with tariffs fixed on commercial principles, will prove a profitable investment of the capital. But the outlay on these public works, until the main lines are completed, must exceed the receipts from the land-sales; and thus it comes that the public debt of New South Wales and the other colonies is growing at the same time that the revenues are abnormally large.

**MILITARY FORCE.**—The Australian colonies have busied themselves lately with military defenses and the organization of militia forces. This military activity was accelerated after the outbreak of hostilities in Egypt. Victoria has

expended £200,000 in the reconstruction and extension of coast-batteries, and £100,000 for gunboats, torpedo-boats, and war material. Torpedoes have been sunk in both the main entrances to Melbourne port. The colony has a paid volunteer corps, armed with Martini-Henry rifles, numbering 3,903 men. The naval armament consists of an ironclad, a wooden frigate, a sloop-of-war, and two new gunboats. Sydney is the chief station for the imperial squadron. In return for the resignation by the Home Government of all rights over land in New South Wales the Colonial Government has provided a navy-yard and a residence for the admiral. The fortifications at the entrance to Port Jackson and Sydney Harbor have been strengthened. In South Australia a permanent artillery corps has been established, a gunboat purchased, and the forts renovated. The military preparations have been made in concert by the different colonies according to the recommendations of the Governor of South Australia, Sir William Jervois, a distinguished officer of engineers, who was instructed by the Imperial Government to look into the colonial defenses.

**AREA AND PRODUCTS.**—The total area of the Australasian colonies is 3,103,903 miles. Their aggregate male population in 1880 was 1,499,258. The total population of Australia, by the census of 1881, was under 2,250,000. The land in cultivation was 6,371,238 acres. The aggregate agricultural production of that year was as follows: 36,846,950 bushels of wheat, 17,766,875 bushels of oats, 3,506,191 of barley, 6,335,239 of maize, 424,155 tons of potatoes, nearly 1,000,000 tons of hay, and 1,871,861 gallons of wine. The flocks and herds numbered 1,064,655 horses, 7,878,782 cattle, 65,915,765 sheep, and 882,337 swine. There were 24 animals, but less than one inhabitant, to the square mile. The revenue raised by the colonists has increased from £15,927,000 in 1879, to £20,776,000 in 1882. The imports in 1880 amounted to £45,060,000, and the exports to £48,866,168, a trade of £35 *per capita*.

**VICTORIA.**—The compromise Cabinet of Sir Bryan O'Loughlen held out only because the two leading parties in the colony were neither of them strong enough in the House or in the country to make a Government, and so they both of them gave some amount of support to this Government, which represents no particular views or party. Mr. Berry attempted to carry a vote of confidence, on the ground that the Government had purchased pipes and railroad-wagons in England, but the Parliament was not caught by such a demagogic appeal. A tariff commission has been hearing the views and complaints of all classes regarding the tariff. The farmers complain of the high price of implements. A manufacturer of steam-engines declared that the complex tariff works injuriously for his branch. The brewers asked for a rebate of duty on barley converted into malt, while the grain-growers demand the con-

\* Even in America, the theory of the homestead laws is ignored since modern transportation has rendered the production of animal products, on a large scale, on outlying lands, profitable. Such is the exigency of economic laws, that the advantage given to money-lenders, by the sanguine disposition of farmers to improve their property with borrowed capital, without reckoning on years of failed crops or low prices, has been used to bring about a new distribution of land, and the building up of large properties in some of the settled states, since the cultivation of cereals on the extensive system has become profitable; although the introduction of the Metayer system has also much to do with these changes. The vastness of some of the pastoral estates in Australia is illustrated by an auction-sale which took place at Melbourne, at which 385,000 acres of first-class riverine land, the greater part freehold, stocked with high-grade sheep and blooded cattle, with residence, pleasure-grounds, shops and tools, steam-machinery, and all improvements equally complete, changed hands for the sum of £447,000.

tinuance of protection against the superior barley of New Zealand. In obedience to a general demand Parliament repealed the stock-tax, which enhanced the price of meat in Melbourne, hampered the meat-preserving industry, and helped to divert the Riverina trade from Melbourne to Sydney. The trade of the Riverina country, which formerly went to the nearer Melbourne, now finds its outlet by the railroads of New South Wales and the steamers and railroads of South Australia. The extension of the New South Wales Railroad to Hay threatens to draw away this valuable trade from Melbourne. The repeal of the duty on live-stock, imposed at the height of the protectionist fever under the Berry Government, by which 9d. is collected on every sheep brought across the Murray from New South Wales, is not sufficient to restore the Riverina traffic to Melbourne. A lively war of rates was opened between the two Governments. In this contest Victoria is at a disadvantage, notwithstanding the shorter length of its trunk-line, as it was built when wages were at their highest point. The considerable revenue derived from the imported goods supplied to the interior of New South Wales furnishes a fiscal motive for sacrificing the railroad profits in this freight competition. This danger to the commerce and revenues of Victoria is the principal reason for the progressive railroad policy which has been inaugurated. No less than fifty-six new lines have been projected, at a total estimated cost of £2,500,000. One feature of the scheme is to tap the Murray at three points, so as to regain the Riverina traffic. A loan of £4,000,000 is to be raised in England. A new land policy was also inaugurated. Under the old homestead law, the land was all falling into the hands of speculative capitalists. To check this, a land-tax was imposed, which discouraged all purchasers.

A harbor-trust act authorizes a loan for the project of making Melbourne accessible to large vessels.

The diamond-drill, which passes through the hard basalt with rapidity to great depths, and does away with the expense of sinking shafts to explore for gold, has come into common use in Victoria, and given a great impetus to the mining industry.

The census of Victoria, taken April 3, 1881, gives the population as 452,083 males, and 410,263 females; total, 862,346. This shows an increase in ten years of 12·7 per cent in the male, 24·1 per cent in the female, and 17·9 per cent in the total population.

**NEW SOUTH WALES.**—The public affairs of New South Wales are held in the firm grasp of Sir Henry Parkes, the Premier, and Sir John Robertson, who are fortified in their position by the enormous patronage which they dispense, owing to the working of the Robertson land laws. These laws discourage immigration and agriculture, although they do not interfere with the development of sheep-culture.

Through their operation the public domain is being rapidly alienated, and falls exclusively into the hands of land monopolists, who have purchased all the lands opened by the new railways in enormous tracts. These purchasers are the squatters, who have already stocked the land with sheep, and grown wealthy from the produce. The dryness of the season of 1882 only partly checked the pastoral prosperity. An act to promote artificial irrigation, called the water conservancy act, was suggested by the late droughts. Under it many districts have raised money to carry out extensive schemes of water storage. Wages in New South Wales were never so high, or speculation so rampant.

The population of New South Wales increased in ten years 50 per cent, being over 750,000 by the census of 1881. Two thirds of the increase was due to the natural excess of births over deaths. The immigration is mostly from the neighboring colonies. The wool export increased from £4,750,000 in 1871 to over £7,000,000 in 1881. Including hides, tallow, preserved meat, and live-stock, the total export of pastoral produce amounted to £8,750,000. The number of sheep in the colony increased from 16,000,000 to 33,000,000. The number of cattle barely increased, large numbers having been sent away to Queensland; the local price of beef has risen. The cereal product has increased but little; droughts and rust discourage agricultural enterprise, and the best wheat-lands are remote from the coast. Although gold production shows no increase, the development of tin and coal mining has increased the value of the mineral product over one third in ten years. The coin and bullion in the colony has increased from £10,500,000 to £36,500,000, or from £16 to £35 *per capita*; some proportion of this remarkable accumulation represents English capital, which has been largely sent over for investment in the latter half of the decade. The amount of the discounts and mortgages rose from £9,500,000 to £27,000,000.

**QUEENSLAND.**—Sugar-growing is rapidly assuming the proportions of a leading industry in this colony, though it will take many years at the present rate of increase for the product to supply the markets of Australia. An important movement for the separation of Northern Queensland from the rest of the colony has been set on foot. The Brisbane Government and people desire to become dissociated from the sugar-planters, and relieved of responsibility for the abuses of coolie labor. The whole northern, tropical coast of Australia may be united into a single colony, governed on the basis of "black" labor, and with the idea that this form of slavery is indispensable for the development of the region. The Government geologist reports the discovery of numerous and thick seams of coal near Palmersville.

Western Australia, which has made but slow progress hitherto, is developing fast under the tide of immigration which has set toward the Kimberley and other rich tracts of pastoral

territory. Railroads are projected from Perth, the capital, to Albany, King George's Sound, and the northern districts.

**NATIVE QUESTION IN NEW ZEALAND.**—The only settlement which is promised for the native question in New Zealand, which has been reopened by the recent invasion of the North Island by new colonists, is the expulsion of the Maoris from their remaining lands and the rapid extinction of the dying race. The Maori chief, Te Whiti, who gathered about him about two thousand natives on the west side of the North Island, and offered a passive resistance to the confiscation of the Parihaka tract, was first approached with an offer by the colonial authorities to settle his followers on other lands. Te Whiti was a pious Christian, who had received his instruction from Lutheran missionaries. He preached in the monthly assemblies at Parihaka that God would preserve their hereditary lands to the natives if they bore themselves worthily. The tract in dispute belonged to the Taranaki tribe, and had been declared confiscate twenty years before, as a penalty for an insurrection, in which nearly all the natives of the west coast took part. They were left in possession, and the Government subsequently promised that they should have the title restored to them. Now that the land had become valuable for occupation, the Government proceeded to carry out the old decree. The religious enthusiast who led the natives was opposed to all forcible resistance, but refused the reservation which was offered in the place of the Parihaka block. They asserted their legal rights by removing the fences set by the surveyors, and by many of them squatting in the tract and plowing up the land. The Government, on the pretext that the monthly meetings constituted a danger to the peace, took peremptory measures against the natives, who were only asserting their treaty rights by peaceful and proper methods. The Minister for Native Affairs, Mr. Bryce, at the head of the armed constabulary and a strong force of volunteer rifles, marched into Parinaka Pah, the Maori village. Not the slightest opposition was offered. Te Whiti was arrested, with Tohu, his principal lieutenant, and the other chiefs, on the charge of seditious practices and language. Their followers were taken away from their lands and distributed among the different tribes of the Maoris. A special law was passed by the Legislative Assembly, by virtue of which the chiefs were kept in close confinement, without trial, until the next session. Sir Arthur Gordon, the Governor of the colony, did not approve the expulsion of the native squatters from the holdings to which they had obtained a presumptive right by *bona fide* settlement, which should enable them to have their claims judicially examined. A correspondence was carried on over this point between the Governor, the Prime Minister of the colony, and the Secretary of State for the Colonies. In

April Mr. Hall, the Prime Minister, resigned on account of ill health. Sir Arthur Gordon, with a singular disregard for constitutional precedents, went to the leader of the Opposition, Sir George Grey, who was twice Governor of New Zealand before the parliamentary constitution was conferred, and has been at different times since the Prime Minister, with the proposition that he should form a ministry which should be actuated by a keener sense of justice to the natives. Besides the special act under which Te Whiti and the other prisoners were held in prison, the ministry had carried an act of indemnity to protect them from the consequences of their high-handed proceedings. Sir George Grey, as a true colonial politician, not only declined to attempt forming a Cabinet, but when the acts were brought forward in the Assembly, to the disappointment of his own followers, he expressed complete approval of the course of the Native Minister. The ministry was reconstituted under Mr. Whitaker, previously Attorney-General, as Colonial Secretary, with Major Atkinson as Colonial Treasurer, Walter Johnston as Minister of Public Works, and Mr. Bryce as Minister for Native Affairs. Te Whiti, after being kept in prison for many months, was given a tour in railroads and steamers all through the South Island, in order to impress him with the power and superiority of the white conquerors before setting him at liberty.

A deputation of Maori chiefs visited England in the summer for the purpose of enlisting sympathy in behalf of their dying race. It is proposed to defend their remaining possessions by confiding them to a trust association in England, which will obtain the best prices for them, and invest the proceeds so that they will yield annuities to the remnant of the race. There are ten million acres, which will yield £4,000,000 within eighteen years, and leave land of the value of £14,000,000 for subsequent sale and distribution among the Maoris and shareholders of the association.

**REVENUE.**—The revenue of New Zealand in 1881-'82 was £3,488,170, being £190,650 in excess of estimates; £125,000 of which excess was under the head of customs and £11,115 under that of stamps, showing increased consumption and accumulation of capital. The railroads produced less than the estimate, but the receipts were largely in excess of those of the previous year. They pay 4 per cent net on the cost of construction. The land-sales amounted to £317,000, of which £34,000 was in deferred payments, showing the success of settlers who took up land without any capital. The deposits in the savings institutions, chiefly in the Government banks, give another indication of the general prosperity. These deposits aggregate £1,549,000, belonging to 61,000 depositors. Of the population of New Zealand, which has increased in ten years from 266,988 to over 500,000, the class of workers for wages,

including female servants, numbers 323,000; 96,000 who do not work for wages pay no property-tax—that is, are not possessed of property to the amount of £500—and 68,445 pay property-tax. The incidence of taxation is about £1 *per capita* for the wage-earning class; £2 13s. for the intermediate class; and £6 8s. 6d. for the class which pays the property-tax, but the impending reduction of this tax to one half the present amount will reduce the average burden of this class to £4 10s. The public debt of New Zealand, after deducting £2,226,000 of sinking fund, stands at £27,680,000. It is to be increased £4,000,000 by borrowing in London £1,000,000 a year for three years and by a special loan of £1,000,000, in order to complete the trunk lines of railroad and some other public works.

**RAILROADS.**—The capital already invested by the Government in railroads amounts to about £11,000,000. Of the 1,333 miles constructed, 875 are in the provinces of Canterbury and Otago, in the South Island, while in the North Island only 458 miles have been opened. The colonists think of expending a million sterling a year of borrowed capital on the railroad development of the North Island, though the Opposition party expressed alarm at the proposal of the new loan. The running expenses of the railroads are light, averaging 47½ per cent of the gross receipts. The state will receive benefits from the sales of public land in the North Island, which it could not in the older provinces, where the soil was already monopolized by owners of enormous estates. Here the early squatters or run-holders were permitted to convert their leases, covering blocks of tens of thousands of acres, by pre-emption into titles in fee simple. The agricultural lands in the North Island are being rapidly taken up by immigrants from England, most of whom are possessed of capital. This rush is due to the agricultural depression in Great Britain. There are no markets at present accessible to the produce of the immigrants. Hopes have been raised by the successful shipment of a cargo of 7,000 frozen sheep to England which were sold in London as first-class meat.

**LAND SYSTEM.**—A new feature in the land system is the Government proposal to grant leases at a low rent, with fixity of tenure, and the privilege of renewing the lease from term to term. The tenancy must in no case exceed 640 acres, and can not be held along with other land. The Colonial Treasurer, Major Atkinson, has made a novel legislative proposal, which may not become law, but which illustrates the proneness of these active colonies to entertain projects of social reform. This is a scheme of compulsory Government insurance, by which about £40 should be collected from every young person in the colony, in weekly payments, between the ages of sixteen or eighteen and twenty-three; this would afford sick-pay, a superannuation allowance of 10s. a week

from the age of sixty-five, and a pension to widows of 15s. a week. A system of voluntary Government life-insurance has been in successful operation for twelve years. The Government offices do more business than all the private companies combined, and derive from it a profit. The Post-Office and Government Savings-Bank assist the laboring classes in the payment of small life-insurance premiums. Another institution of a similar kind, in which New Zealand leads older countries, is the administration of marriage settlements, trusts for infants, bequests, and other private trusts, by an official trustee. The aggregate borough and county valuations for land-tax and property-tax in New Zealand are £236,000,000. In 1870 the total valuation of real and personal property was £50,000,000.

The wool exports of New Zealand for the year ending September 30, 1881, amounted to 60,477 pounds, valued at £3,001,288. Gold, wheat, oats, and barley, kauri-gum, and rabbit-skins, are the other principal exports. Rabbit-skins are being exported also from Victoria, where a premium is paid, as in New Zealand, for the destruction of these pests to the farmer. The exports of 1882 show a marked increase over the preceding year. A line of steamers is to run from New Zealand to England, for which an annual subsidy of £20,000 has been voted by the Assembly at Wellington.

**AUSTRIAN ELECTORAL SYSTEM.** Austria really has three parliamentary bodies—the Upper and Lower Houses of the Reichsrath and the Delegation to the joint Parliament with Hungary. Its electoral law is one of the most complicated in Europe; like a strange piece of variegated work, the colors of the present are confounded with those of the past time. Resting at once on representation of orders, a relic of former periods, and upon a direct vote which has been recently won, it bears the characteristic stamp of Austria, by observing the distinction of nationalities. The body of electors is, therefore, composed of four divisions—the large proprietors, the cities, the chambers of commerce, and the country communes.\*

Of the three hundred and fifty-three members which compose the Reichsrath, a word used to designate the whole Parliament and also the Lower House, the first group consists of eighty-five, who are elected by the large land-holders who pay a direct land-tax of not less than two hundred and fifty florins, in Bohemia, Moravia, and Silesia; of two hundred florins in Lower Austria; and of a hundred florins in the other countries, except Tyrol, where it is fifty florins: but the elector must be a noble. That dignity is not required elsewhere; it is sufficient to possess an ancient estate which is entered in the register of the province. Such an estate can not be divided, but it may be sold, and the purchaser becomes an elector, even if the transfer was made only a few days before the election. Hence arise bad

\* M. A. Keynaert, "Revue Générale," July, 1881.

transactions and speculations, that debase the right of suffrage to an article of traffic, which turns most frequently to the advantage of the Germans and the Jews, who are the largest owners of personal property. This land group, which, according to its nature, should represent the landed and noble aristocracy, has been democratized in another respect. If the electoral census is differential, if it is scaled by kingdoms and states, it is subject, on the contrary, to a leveling equalization in the interior of the same circumscription. Whether they pay the minimum tax, varying from two hundred and fifty to fifty florins, or an enormous tax like Prince Adolph Schwarzenberg, whose assessment is one million florins, yet all the great proprietors are placed on the same level. They have only a single vote, and are especially included in a single electoral college, excepting, however, Dalmatia, which has four, and Galicia six, colleges. Thus, as a striking illustration, the proprietors of Bohemia assemble on an appointed day at Prague, and elect the twenty-three deputies to the nominating convention. Now, as the two parties are very nearly equal in strength, the influence of the Government is almost always sufficient to give the majority to the Germans, and to exclude the Slavs from all representation. Thus, the influence of the rich old families of Bohemia and Moravia, who are the owners of thirty villages, is absolutely paralyzed by the comparatively small proprietors, who are Germans and Israelites, and who bought, only a short time before the election, the land which carried the right to vote. An unsuccessful attempt has been made to divide the landed group of Bohemia into three electoral colleges. Besides the exceptions of Dalmatia and Galicia from the rule of one electoral body, another exists in Bukowina, which has three representatives. The greater part of the proprietary electors are Roumanians, and one electoral body gives them a decided superiority. To prevent this unfavorable result to the Germans, the group has been divided into two bodies or *curia*, of which one is composed of ecclesiastical dignitaries of the Greek rite, and the prior of a monastery, comprising in all seven electors, who generally elect the governor of the province for deputy.

The ecclesiastical *curia* of Bukowina is not the only exceptional feature of that electoral district; for the voter can be represented by proxy. Then, women of twenty-four years of age, and legally independent, have the right to vote. They vote according to the local law, generally by their husbands, or, if they are daughters or widows, by proxy. The right to vote is also given to corporations and societies whose landed interests have elevated them to the class of great proprietors, especially to funded institutions, to schools, churches, and hospitals, whenever there exist express provisions in the provincial law. The right is for them exercised by a person designated in the charter of

the institution, or by a special delegate. The elector can, at the same time, vote for himself and as a *mandataire*. The same proprietor can hold the right of suffrage in different districts, and it is this fact which has secured the vote by proxy.

The second and third groups embrace those engaged in commerce, industrial pursuits, and the liberal professions. These are the ancient citizens. The two groups have one hundred and thirty-six *mandats*, which is four more than the rural communes, which have one hundred and thirty-two. Nevertheless, the population of the open country is much more numerous than that of the cities. According to the census of 1869, Cisleithan Austria had 8,000,000 inhabitants devoted to agriculture, and only 2,500,000 engaged in commerce and industrial pursuits. In the Slav provinces the disproportion is still greater. But this is not the only disadvantage which the rural population suffers; for, while the other groups vote directly, the country electors choose from among themselves certain persons, who in their turn make a choice of the deputies. At the primary election, five hundred inhabitants choose one. It is still a *mandat*, which in some respects resembles the *mandat* of the great proprietor; but, while the latter is free and personal, the first is forced and collected. Such is the rule. But, in order to complete the complication, aside from the "indirect" electors, there are in the rural communes "direct" electors, who are relieved from the primary vote, and who consist of owners of landed estates, but who do not pay a sufficient tax to place them among the great proprietors.

Whence comes this shocking inequality? It can be explained only from the fact that the electoral law is the work of the German party, which has favored the cities, where the population is principally German and liberal, to the detriment of the open-country people, and especially the conservative and Slav element. Such is the case also with the chambers of commerce, nearly all of which are in the hands of a growing liberal majority.

The great proprietors, the citizens, and the peasants are the exclusive possessors, although unequally, of the political influence of Austria. To this fundamental division of the electoral body there is added another of great weight likewise, and which equally tends to secure the pre-eminence of the German population. It is the division of *mandats* among the numerous nationalities adjacent to each other or confounded together in the empire. This division is in no sense proportional, nor is it made according to the number of the population, or the amount of taxes. Austria is estimated to contain 13,000,000 Slavs, 500,000 Italians, 200,000 Roumans, 600,000 Israelites, and 7,000,000 Germans. If universal suffrage existed, or if the election were made on an equalized basis, the majority would undoubtedly be steadily on the side of the Slavs. It is far from being so

now. The Germans, although less than half of the population, have in the House actually more than two hundred of the three hundred and fifty-three deputies. In Bohemia, in particular, the law of 1873 assigns thirty-four deputies to 2,500,000 Slavs, and fifty-six deputies to 1,500,000 Germans.

One can conceive how this law must raise opposition. It has been assailed vigorously, especially by the Poles, who refuse to assent to it, notwithstanding all the independent concessions that have been offered to them. When the bill was presented, on February 15, 1873, M. Casimir de Grocholski denounced it as a flagrant violation of national rights, and withdrew, at the head of all his friends, from the Polish bench. Nevertheless, the bill was passed some days afterward by one hundred and twenty votes to two, in the absence of the Czech and Polish deputies.

The agitation for an electoral reform has commenced, and penetrated the most diverse classes of society and the most opposite political parties. Operatives and peasants, socialists and democrats, progressives and conservatives, agree in the desire to modify the law, although their views have been very different relative to the extent of the modification. Some attempts at reform have been made in the Reichsrath, and an important measure has passed, by which the qualification of voters was lowered from ten to five florins in towns, and the number of voters considerably increased. In the unique political condition of Austria it is the so-called Liberal or Centralist party which will lose by the extension of the franchise, and which opposes it as a danger to its pretended Liberal principles. Liberalism in Austria, as above stated, means Germanization and the continuance of German domination. The Liberal, or German Constitutional, party, with which Prince Auersperg fell in 1879, was, like the Liberals of Germany and Republicans of France, brought into discredit by the financial speculation and corruption which flourished under their rule, while its main political aim was the reactionary one of combating the Czechish movement, and keep the Czechs and other Slavic races in political subjection to the Germans. The Clerical party, on the other hand, was in thorough sympathy with the Czechs, who had preserved a haughty silence ever since the dual Constitution had left their great nation unfranchised, but who were now thoroughly aroused. The Clericals were thus the advocates of popular rights. They received a partial support from the German Conservatives. In the Taaffe Ministry the Czechs found recognition for the first time. They have made great headway in their struggle to preserve the Bohemian language and national ideas and customs from the extinction systematically planned by their German rulers. The success of the Czechs has given heart to the various lesser nationalities in Austria. The distinctive policy of the Taaffe Government is

to favor the Slav races and reverse the process of forcible Germanization. The new electoral law was not brought in by the Government, but adopted, and its limits set after it was under discussion. Under this new law the representation will be something like 183 Germans and 167 of other nationalities; while, if the programme of the new German People's party were carried out, class representation abolished, and the suffrage greatly extended, it would be 225 of other nationalities against 127 Germans. Placing the limit at "five-gulden men," and not lower, was done out of regard for the German dread of the "Slavic inundation." Count Taaffe's Ministry does not represent either of the warring elements, but acts as an intermediary between them. The working majority with which he carries through his compromise measures, often by a very close vote, contains a considerable element in moderate sympathy with German prejudices. If he should be driven by an adverse vote to dissolve Parliament, a strong phalanx of Czechs and Clericals would be returned under the five-gulden qualification, which would drive him more rapidly in the course which he is pursuing.

The electoral question was introduced in the Provincial Diets, and gave rise to sharper struggles than attended its discussion in the Reichsrath. With the progress of decentralization the Diets are becoming powerful political bodies. The Slavs demanded, reasonably enough, that the electoral limitation should be lowered to the five-florin basis, and attacked the system of class representation. Where the German party would gain, as in Lower Austria, they eagerly supported the electoral reform, but set their face firmly against it in Bohemia, where it would cost them the supreme control which they now exercise.

The House of Lords is neither a popular body nor elective. Like the majority of similar bodies in Europe, it rests upon constitutional right, inheritance of land, or nobility, and the appointment of the Emperor. It is composed of the elder princes of the imperial house, members of right, the nine archbishops, and the seven bishops, who have the rank of princes; the great lord-proprietors, to the number of fifty-three, members by inheritance; and members appointed for life by the Emperor.

The half-Austrian and the half-Hungarian Parliament meets alternately at Vienna and at Pesth. Its authority is limited to the common interests of the empire. Each delegation consists of sixty members, chosen by the Cisleithan and Transleithan Parliaments. The appointments are made in accordance with a proportional division of the whole number among the distinct nationalities.

The variety of nations and languages in Austria has not only produced a strange and complicated electoral system, but it is manifest in the diversity of parties. This does not arise, as under most of the constitutional governments,

exclusively from a diversity, more or less intense and profound, of ideas and political, social, or religious aspirations, but is incessantly nourished by old national memories and the old prejudices of race.

"Centralists" and "Federalists" compose the radical denominations of parties. Apart from the dualism of Austro-Hungary, the state is a unit, and derives its expression from the Constitution of December, 1867. By the force of that instrument, the empire is based upon a single government, with two representative Houses and one responsible minister. This condition of affairs was effected by the Germans, and they desire not only to preserve but to extend and develop it. Not satisfied with placing in the hands of the General Government, whose seat is at Vienna, all the principal interests of the monarchy, nor with having modeled to their liking and arranged to their profit the electoral system, they aspire to secure the predominance of the German spirit and German culture everywhere, or rather to *Germanize* Austria entirely. As M. de Kaiserfeld lately said in the Diet of Styria, who afterward was made President of the Reichsrath: "Austria should be a German state in language and education; the German should be spoken by all persons, and serve as a political bond to all the races and nationalities of the empire; the unity of language, an expression and symbol of the state, is the *sine qua non* condition of the existence even of Austria. Consequently, all the citizens, whatever may be their mother-tongue, Czechs, Moravians, Slovaks, Poles, Ruthenians, Slovens, Roumans, and Italians, should submit to the baptism in the German school, if they desire to take a part in the public affairs of the state." This was the demand of Kaiserfeld in the name of his party. Some one answered: "You desire to Germanize the empire; you are not Austrians, you are Germans." He protested in reply, "There are no Austrians in Austria—only Germans!" The objects of the German party are the same at this day. Although the Constitution proclaims the equality of languages, yet a profound discontent has arisen under the just concessions in that respect made to Bohemia and Moravia. For the purpose of a reaction against these measures, and definitely to secure to the German language the ascendancy over the other idioms, the Progressives have obtained the examination of a special committee on propositions, tending, in the first place, to regulate by law the use of languages in Bohemia, and, secondly, to recognize the German as the official language of the state.

Thus centralism consists in the political and social leadership of the German race for the very existence of the state. But their partisans do not all go to this length. The Centralists, properly so called, do not limit their unifying aspirations to Cisleithania; they cross the river, and desire to rupture the compromise with Hungary. Instead of that arrange-

ment, already twice confirmed, they desire to substitute a "personal union," and, consequently, to abolish the common delegations. Others, on the contrary, yield to the existing relations, and desire to preserve the political and administrative division, so that the dualism of Austro-Hungary shall remain.

In the face of German centralism, federalism raises itself, with claims of effecting advantages to the nationalities, and especially the Slav nationality. As there are two groups among the Centralists, so likewise the Federalists are subdivided into two factions on the basis of more or less extensive claims. The Federalists, especially those of Bohemia and Moravia, are, like the ultra-Germans, but under another designation, and for another object, the avowed adversaries of dualism. To that agreement—which, according to their views, has violated their historical right in destroying the equilibrium between the states essentially distinct and independent of each other—they seek to substitute a general federation embracing all the countries of the empire, including Hungary. This is a complete negation of the supremacy of Austria, and involves the destruction of the constitutional charter. In 1877 Count Beleredi said, "Historical Austria, which God has designated in this world to be the protector of the Church, the guardian of the rights and liberties of these countries and peoples, should become a confederation of states, united by solemn compacts, under the scepter of the illustrious house of Hapsburg."

The other faction of "autonomists," on the contrary, do not desire to disturb the general organization of the empire, nor the compromise with Hungary. They look, in the first place, to the rights of their respective countries, for the advantage of which they demand an extension, in different degrees, of their independence, such as is already more or less consistent with constitutional law. Among these the Poles must be classed, who, in hatred of Russia, dread the exaggerations of Slavism, and who, while desiring a large autonomy for Galicia, desire to preserve Austria strong and powerful. Nevertheless, if there exists a real difference between the Federalists and the Autonomists, yet in the daily discussions it is not apparent.

As in Germany the "Particularists" belong to the ranks of the Conservatives, whether Catholic or Protestant, while the partisans of centralism are grouped under the flag of liberalism, so in Austria the Federalists, in the general acceptance of the term, are the Conservatives, and the Centralists the Liberals. However, it should be observed that the intermingling is not absolutely complete between the Autonomists and the Conservatives, nor between the Centralists and the Liberals. The flag of the Federalists shields in effect the young Czechs and the Poles; all of the former, and a very large number of the latter, pay homage in different degrees to liberal ideas. The tendency to autonomy unites them with the

Conservatives. The ground of common action is not strictly the political question, but the national question. So in the ranks of the Centralists are Conservatives whose alliance with the Liberals rests only on their aversion to federalism.

The same observation may be made relative to another division of parties—the "Constitutionalists," who are Centralists or Liberals, and the "Anti-constitutionalists," who are Federalists or Conservatives. But the truth is, that there are partisans and opponents of the Constitution in the ranks of the Liberals as well as of the Conservatives.

The Centralists or Liberals are likewise designated as "the Right," and the Autonomists or Conservatives as "the Left." Here were lately found all the distinctions of the French Lower House—as Left, Left Center, Extreme Left, Right, Right Center, Extreme Right. Ordinarily there are different degrees of the liberal and conservative scale, but the space and duration of these are essentially variable. Accidental rather than permanent distinctions produce fluctuations in the liberal or conservative policy, and are founded more often on divergence of tactics than disagreement in principle.

**AUSTRIA-HUNGARY**, an empire of Central Europe composed of the federated kingdoms of Austria and Hungary, which were definitely organized as separate states in 1867. Both crowns are hereditary in the Hapsburg family. The Emperor, Francis Joseph, born August 18, 1830, succeeded his uncle, Ferdinand I, who abdicated in 1848. The heir-apparent is the Archduke Rudolf, the Emperor's only son, who was born August 21, 1858. Common affairs, relating to the common army and navy and foreign policy, are referred to delegations of deputies from the two Parliaments, to which the Common Ministers are responsible. The Common Ministers at present are: Count Kalnoky, who succeeded the late Baron Haymerle as Minister of Foreign Affairs in November, 1881; Lieutenant Field-Marshal Count Bylandt-Rheydt, appointed Minister of War in 1876; Baron von Kallay, Minister of Finance, appointed after the resignation of Baron Szlavy in May.

The Austrian Ministers are: Count Taaffe, President and Minister of the Interior; General Count Welsersheimb, Defense; F. Ziemiałkowski, without a portfolio; Count Falkenhayn, Agriculture; Baron Eybesfeld, Education; Dr. Dunajewski, Finance; Baron Friedenthal, Commerce; A. Prazak, Justice.

The Hungarian Ministers are: Tisza, President; Baron B. Orczy, Minister of the Court; A. de Trefort, Education; Baron Orczy, Defense; Baron Kemeny, Agriculture and Commerce, and *ad interim* of Public Works; B. de Komor, of Croatia-Slavonia; Dr. Pauler, Justice; Count Szapary, Finance.

**STATISTICS.**—The area and population of the two monarchies and of their provinces, according to the census of December 31, 1880, were as follow:

PROVINCES OF THE EMPIRE.	Area in square miles.	Population.
<b>GERMAN MONARCHY:</b>		
Lower Austria (Unter der Ens).	7,654	2,390,621
Upper Austria (Ober der Ens) ..	4,631	759,620
Salzburg .....	2,767	168,570
Styria (Steiermark) .....	8,670	1,213,597
Carinthia (Kärnten) .....	4,005	348,730
Carniola (Krain) .....	3,856	481,243
Coast-land (Küstenland) .....	3,084	647,834
Tyrol and Vorarberg .....	11,324	912,549
Bohemia (Böhmen) .....	20,060	5,560,819
Moravia (Mähren) .....	8,583	2,158,406
Silesia (Schlesien) .....	1,987	565,475
Gallcia (Galizien) .....	30,307	5,958,907
Bukowina .....	4,035	571,671
Dalmatia (Dalmation) .....	4,940	476,101
Total, German monarchy .....	115,903	22,144,243
<b>KINGDOM OF HUNGARY:</b>		
Hungary and Transylvania .....	108,258	18,778,266
Croatia and Slavonia .....	16,773	1,198,408
Town of Fiume .....	5	17,865
Military Frontier .....	7,890	701,546
Total, Hungary .....	132,929	15,695,184
Total, Austro-Hungary .....	240,942	37,839,427

The number of inhabitants to the square mile is 159 for the whole empire. The population of Austria has increased only 8·4 per cent since the census of 1869; and that of Hungary has remained almost stationary, the increase being but 1·8 per cent. This is chiefly owing to a high rate of mortality. The Germans constituted 38 per cent of the population of the German or Cisleithan part of the empire, and 20 per cent in the Hungarian or Transleithan part. The Slavonian races predominate, forming 49 per cent of the population of Austria and 16 per cent of that of the Hungarian dominions. The Magyars constitute 58 per cent of the Hungarian population. They form no appreciable proportion of the population of Cisleithania. The population of Vienna is 705,402, against 607,614 in 1869; but including the suburbs it numbers about 1,800,000 inhabitants. Of the other principal towns of German Austria, Prague contains 162,318 inhabitants; Trieste, 144,437; Lemberg, 110,250; Gratz, 97,727; Brünn, 82,665; and Cracow, 66,095. Of the Hungarian cities, Buda-Pesth has 359,821 inhabitants; Szegedin, 50,988; Holdmezo-Vasarhely, 74,094; and Maria-Theresiopel, 61,655. Two thirds of the population of Hungary are engaged in agriculture, but the proportion is diminishing and the relative population of the towns increasing. The density of population in Hungary is 125 per square mile, against 191 in the Austrian dominions. The percentage of the population adhering to each of the various religious denominations is as follows:

DENOMINATIONS.	Austria.	Hungary.	Whole empire.
	Per cent.	Per cent.	Per cent.
Roman Catholics ...	80·4	48·6	66·4
Greek Catholics ...	11·7	10·2	11·0
Evangel. Protestants ...	1·7	20·4	10·0
Byzantine Greeks ...	2·5	16·7	9·0
Jews .....	8·5	3·6	3·2
Unitarians .....	...	0·3	0·2
Catholic Armenians ..	...	0·1	0·1
Other sects .....	0·2	0·1	0·1

The increase of the Jewish race exceeds in a remarkable degree that of the rest of the population in the dominions of the Austrian crown. The number of Jews in Cisleithan Austria increased between 1869 and 1881 from 822,220 to 1,005,563, or 22·9 per cent, representing a mean annual increase of 2·1 per cent. The rest of the population increased from 19,395,311 to 21,125,142, or 7·9 per cent, the annual increment being 0·6 per cent. Between the censuses of 1857 and 1869 the increase of the Jews was 32·4 per cent; of the Christians 10·2; between 1850 and 1857, among the Jews 30·3 per cent, among the Christians 3·2 per cent. Previous to 1850 the enumerations of the population were taken in connection with the military conscription. As the young Jews were particularly addicted to fraud and bribery for the purpose of avoiding military service, and in the eastern provinces were accustomed to place themselves across the boundary when the time of enlistment approached, the difference in the returns for the two classes was less striking. Between 1834 and 1837 the reported increase among the Jews was 5·2 per cent, against 2·3 for the remainder of the population; in the enumeration of 1840, 5·4 against 3 per cent; in the one taken in 1843, 5·7 against 2·9 per cent; in that of 1846, 7·6 against 3·1 per cent; in that of 1850, 6·3 against 0·6 per cent. The normal rate of increase among the Jewish race is notoriously greater than among the other peoples of Europe. The main cause of their rapid growth in Austria, however, is the continued immigration from the east of Europe. The increase varies greatly in different parts of the empire, and depends upon the opportunities for their favorite occupations; but everywhere except in a few rural localities there has been an increase. In Lower Austria it was 81·5 per cent in the twelve years; in Salzburg 146·8 per cent; but in Bohemia only 4, and in Moravia only 2·9 per cent. They have settled in districts of Tyrol where a few years ago there were none. In Carniola, Carinthia, and Istria there are still but few; yet the number has increased two, three, and five fold. In the Bukowina, which receives a steady stream from the neighboring Roumania, and where they are thickest, numbering 67,418 to 502,181 other inhabitants, the increase has been 41·1 per cent. The increase is naturally greatest in the cities. Vienna counts 72,543 Jews among its 705,402 inhabitants. They have increased in this capital 80·2 per cent, while the Christian population has grown only 11·5 per cent. They also people the suburbs of Vienna and form a large proportion of its floating and day population. In Prague, with 155,813 inhabitants, the Jews increased 3,515, or 26·8 per cent, and the rest of the population 5,415, or only 3·7 per cent. In Lemberg and Cracow the Hebrews constitute about 30 per cent, and in many of the smaller towns of Galicia four fifths of the population are Jews. In Brody, the chief of these Jewish towns, the increase was only 1·1

per cent, on account of the falling away of trade since its inclusion in the customs boundary and the consequent emigration, whereas in other towns of Galicia it was from 12 to 30 per cent. The discovery of petroleum near Boryslav had the effect of doubling the Jewish population in a few years, while the non-Jewish population showed no increase.

**MILITARY DEFENSES.**—The strength of the common army, recruited on the principle of universal liability to arms, is 296,284 men for the peace establishment, including the reserves. Including the Austrian Landwehr and the Hungarian Honved, the separate militia organizations of the two kingdoms, about 1,000,000 men can be called to arms in the event of a war. The navy consists of fourteen ironclads, ten of them first class, and armed with guns ranging from six and a half tons in weight to the twenty-five-ton guns of the *Tegethoff*.

The territorial organization of the army was instituted, in principle, when the new military system was introduced in 1868. It was not only an essential element of the system of universal service adopted from Germany, but was a political prerequisite amid the diversity and ethnic rivalry of the Austro-Hungarian population. Yet up to the present the actual organization of the army during the term of active service has been directly contrary to the theoretical basis. In order to preserve a national feeling in the sense of the German centralists, the troops of different nationalities have been commingled as much as possible. German has been retained as the language of command. The territorial organization was nominally carried up as far as divisions, but the only service the men ever saw was in temporary bodies studiously made up of battalions and troops detached from their regiments and brought together from distant parts of the empire. There was no organization of the different arms into army corps. The system of military centralization is condemned by all military authorities since the breakdown of the centralized French army and the success of the decentralized German army in 1870. Austria, in adopting the territorial basis, but practically retaining the centralized system, would be doubly unprepared in the event of a great war; aside from the practical difficulties of mobilization and the departmental services attending military centralization, the entire organization of the army into the larger divisions would have to be proceeded with after mobilization, and the regiments would not be composed of men who had served and trained together, but of troops brought together for the first time. As the political interests of the German centralistic element prevented the decentralization of the army, the pressure of the Magyars and the minor nationalities who have acquired political power has accomplished the final reform, although it was hastened by a sense of the danger of the confused and imperfect organization at a time when Austria may be called upon to

put forth her utmost military strength. The Hungarians have long demanded a Magyar army of the line, as they carried through the scheme of a Magyar militia. The alien military system has never been accepted by the majority of the Austrian subjects. When the common army has been split up into a number of little national armies it may be more efficient to fulfill the destinies of the reorganized empire, but the corps of German officers, who have ably conducted the present system, will no longer exist, and the central government will have lost one of its main props. The reorganized army of the line consists of 102 regiments, of four battalions each. This enables every regiment to mobilize one battalion of full strength without calling upon the reserves. One battalion of each regiment will be detached, the same as in France; but the bulk of the regiment will remain in the recruiting district, with its reserves ready to fall in at short notice, instead of having to be called in from some distant garrison. The fourth battalions of thirty-four regiments make up the army of occupation in Bosnia. The whole army will be organized in fifteen corps, each in its recruiting district, with the artillery, engineers, and all the auxiliary services, so that each corps can be mobilized independently, under the directions of the War Department. The division is carried still higher into three army commands, in Vienna, Buda-Pesth, and Prague.

**COMMERCE.**—The total exports of the empire, except the province of Dalmatia, which is not included in the imperial customs boundary, amounted in 1879 to 675,100,000 florins (the florin, or gulden, is a little less than fifty cents); the imports to 551,400,000 florins. Nearly two thirds of the foreign trade is with Germany; of the rest the largest share is with Turkey, Italy and Russia following next, but at a long distance.

**AUSTRIAN GOVERNMENT.**—The Austrian monarchy has a central and local Legislature. The Provincial Diets are competent to deal with matters of local administration, particularly those relating to the cultivation of the soil, and to educational, ecclesiastical, and charitable institutions, and are empowered to levy taxes for these purposes. The central body is the Reichsrath or Council of the Empire. (The system of representation in Austria is explained in **AUSTRIAN ELECTORAL SYSTEM**.) The ministry, which is responsible to the two Houses of the Reichsrath, is composed as follows: Minister of the Interior and President of the Council, Count Eduard Taaffe; Minister of Education, Justice, and Worship, Baron Eybesfeld; Minister of Finance, Dr. J. Dunajevski; Minister of Agriculture, Count Julius Falkenhayn; Minister of Commerce, Chevalier Kerner d'Auenrode; Minister of National Defense, or of the Militia, Major-General von Welsersheimb.

**HUNGARIAN GOVERNMENT.**—The Constitu-

tion of the Hungarian monarchy, consisting of fundamental statutes running back to the Golden Bull of Andrew II granted in 1222, was restored in 1867. There is only one Legislature, elected by the equal votes of all citizens who pay direct taxes to the amount of eight florins annually. The ministry is composed as follows: President of the Council, Koloman Tisza, who has charge of the Department of the Interior; Minister of National Defense, or of the Honved, Bela Szende de Keresztes; Minister Adlatus to the King, Baron Bela d'Orezy; Minister of Education and Public Worship, Dr. August de Trefort; Minister of Justice, Dr. Theodor Pauer; Minister of Public Works and Communications, Thomas Pechy; Minister for Croatia and Slavonia, Count Bedekovitch; Minister of Agriculture, Industry, and Commerce, Baron Kemeny.

**FINANCES.**—The imperial budget for 1883 places the total expenditures at 117,910,763 florins, against 117,148,549 florins in 1882. In the estimates for 1883 102,800,821 florins come under the head of ordinary and 8,774,621 of extraordinary military expenditures. Deducting the balance in hand, and the surplus of the customs revenue over the charges, there remain 99,991,763 florins to be voted by the Parliaments. The extraordinary demand for the cost of the military occupation is only 8,988,000 florins. The sums granted for extraordinary military expenses in the occupied provinces and the Crivoscie for 1882 were, 6,177,500 before the outbreak of the insurrection, and then 8,000,000 florins, and again in April 21,700,000 florins, being 2,000,000 florins less than were asked for; total, 35,877,500 florins. The gross revenue from customs is estimated at 45,269,225 florins, from which are to be deducted 1,850,000 florins for cost of collection, 600,000 florins as the fixed share assigned to Bosnia, and 28,149,000 for restitution of the excise duty on beer, spirits, and sugar exported. This export trade has so increased that an actual deficiency in the net customs revenue was anticipated, but under the operation of a revised tariff it has probably been averted.

Hungarian finances are suffering from a chronic deficiency. The deficit in the ordinary expenditure and revenue in 1875 amounted to 26,800,000 florins. This has been greatly reduced, and the greater part of the recent deficits are due to extraordinary expenditures on permanent public works, such as railroads and the protection of river-banks. The Government are constantly occupied with the problem of making them disappear. Although the debt is increasing, the credit of the Government has improved. The old six per cent debt is being converted at a lower interest.

The Hungarian final estimates for 1882 fixed the total ordinary expenses at 288,306,313 florins; transitory expenses at 3,502,447; investments, among them the Pesth and Belgrade Railroad, at 29,211,311 florins; extraor-

dinary common expenses, including the share in the 8,000,000 florins for military expenses in Herzegovina, at 7,118,210 florins. The total amounts to 328,228,281 florins. The total revenues were fixed at 301,967,214 florins. The Minister of Finance, Count Szapary, was authorized to cover the deficit, except 3,000,000 florins, by credit operations. Sums subsequently voted brought the total expenditures of the year up to 335,242,080 florins. The total deficit was 30,605,867 florins.

The budget for 1883 makes the total estimated expenditures for 1883 322,711,484 florins. The ordinary expenses are estimated at 288,848,002 florins; transitory expenses, or those which are balanced on the other side of the accounts, at 6,503,276; investments at 21,771,855 florins, being less on account of the completion of the Pesth-Theiss and the approaching completion of the Pesth-Semlin railroads; extraordinary military expenses—that is, the extraordinary expenses of the Bosnian garrisons—at 5,588,351 florins. The estimates of revenue in Hungary and Austria are somewhat problematical, being partly based upon the operations of a new tariff. The estimated income for 1883 is 301,029,896 florins, 280,732,785 florins from the ordinary and 20,297,111 florins from the transitory revenues. The Minister expected to reduce the deficit to 12,881,588 florins by new taxes and other financial measures to be proposed to Parliament.

**OCCUPIED PROVINCES.**—The Turkish sanjaks, which were placed under Austrian administration temporarily by the Treaty of Berlin, are governed by the common administration. Their area and population, as enumerated in 1879, are as follows:

PROVINCES.	Area in English square miles.	Population.
Bosnia .....	16,417	862,202
Herzegovina .....	4,308	207,970
Novi-Bazar .....	3,522	142,000
Total .....	24,247	1,212,172

Of the total inhabitants, 496,761 are Greek Orthodox, 448,613 Mohammedans, 209,391 Roman Catholics, 3,426 Jews, and the rest of various faiths. The cost of administration is ostensibly defrayed from taxes raised in the provinces; but the military subjugation of the inhabitants has cost large sums which have been supplied by the Delegations. The budget of the administration of Bosnia and Herzegovina estimates the total expenditures at 7,039,809 florins. Some of the principal items are: central administration, 150,700 florins; gendarmerie, 1,114,475 florins; military contingent, 251,000 florins; education, financial administration, and cost of collecting taxes, 348,000 florins; dotations to the clergy, 162,500 florins. The estimated revenue is 7,217,819 florins. The chief items are as follows: tithes and land produce, 2,250,000 florins; income-tax, 600,000

florins; tobacco, sale and licenses, 1,896,000 florins; sheep and goats, 204,000 florins; pigs, 42,000 florins; licenses for inns, 50,000 florins; excise duty on articles of consumption, including beer, 45,000 florins; stamps and registration duty, 300,000 florins; customs, 600,000 florins. Bosnia has been included in the customs boundary since 1880. The customs revenue contributed by the provinces has averaged only 140,000 florins a year, but they received the fixed sum of 600,000 florins annually as their share. The occupied provinces have beyond this been made to pay for their civil administration, but the Delegations are asked each year for a large sum for extraordinary military expenditures.

**FOREIGN RELATIONS.**—The outward hindrances to the definite annexation of Bosnia and Herzegovina are not slight. Turkey and Russia are not the only countries to oppose it. Herzegovina was at one time attached to Montenegro, and the Montenegrins look upon it as their rightful possession. The rayas of the Bosnian valleys are of kindred blood with the Servians, and most of them speak the Serbian language. The dream of a Great Serbia is almost as dear to them as it is to the Serbian patriots. Austria is constantly increasing her influence in the South Slav principalities. Serbian politics are controlled from Vienna instead of from St. Petersburg, but the Austrian ascendancy has alienated the people from their ruler, who recently assumed the kingly title under Austrian auspices. The erection of their country into a kingdom is a step toward the accomplishment of the inextinguishable idea of a Great Serbia. Hatred of the arrogant Schwabs, as the German-speaking Austrians are called, is increasing in all the Slav principalities. Every convulsion among the Balkan populations sets Russia throbbing in sympathy. At the outbreak of the insurrection in the Herzegovina the same phenomena that preceded the Turkish war were noticed; but, as they did not reach the dangerous stage of an open participation of Russians in the rebellion, the war-cloud passed over. Count Kalnoky, who is at the head of the Austrian Foreign Office, is confident that the conflicting interests of the two empires can be peaceably reconciled. Signs of Pan-Slavic activity were detected among the Ruthenians in May. A whole village had gone over from the Roman Catholic to the Greek Orthodox faith. The discovery of papers showing a systematic religious and political propagandism led to the arrest of eleven Ruthenians, who were brought to trial for high treason. Austria and Germany shape their foreign policy in common, and speak with one voice in the councils of Europe. The German allies have constituted themselves the guardians of the peace of Europe, and use their powerful influence to arrest any cause of disturbance. One of the periodical meetings of the two Emperors took place at Ischl in August.

The question of returning the friendly visit of King Humbert was a state problem of some difficulty. The Emperor Francis Joseph would not visit Rome without paying his reverence to the Pope, which might bring him, the Italian King and his people, and all the courts of Europe, face to face with the papal question, which perhaps he would not have been loath to bring up. The Italian Government was unwilling to risk the consequences. For the King to capitulate his capital to the Pope and appoint a rendezvous outside would have been ignominious. Count Kalnoky announced that he could not recommend Rome, and the correspondence broke off without umbrage, but with the position of the Pope decidedly strengthened as the result of Francis Joseph's pious fidelity.

At the celebration of the five-hundredth anniversary of the union of Trieste with Austria, and at the subsequent visit of the Emperor on September 17th, Irredentism manifested itself not merely in inflammatory proclamations but in villainous plots. A grenade was thrown into a procession on the arrival of the Archduke Karl Ludwig, and on the coming of the Emperor an Austrian deserter, named Oberdank, was arrested with Orsini bombs in his possession. The inhabitants of Trieste are thoroughly loyal to Austria. They have reason to rejoice that their city is Austrian, for it would be only one of several Italian ports on the Adriatic, while now it has the monopoly of the Austrian Mediterranean trade and a large share of the southern and eastern trade of Germany.

**POLITICAL SITUATION.**—The transformation of the empire from a centralized state to a federal union has proceeded far enough to show that the cohesive principle will not be lost. The minor nationalities, having tasted the sweets of political liberty, are more urgent, and the Germans cling less tenaciously to the power which is slipping out of their hands. How far the traditions of German order and thoroughness will be preserved in the new centers of power under popular government, which is inevitable, is the subject of national misgivings. The Hungarians have won their liberty and managed their own affairs under a system of government which seems to satisfy the people. In imperial affairs their Parliament has an equal voice with the Reichsrath. The two Delegations, or committees from the two bodies, must agree upon the appropriations, although Hungary contributes but thirty per cent of the amount. The political ferment is confined to Cisleithania. It takes the singular form of a war of languages, and an agitation for the political equality of the different races. Of individual equality very little is said, although Austria is the last country in Europe in which the basis of political representation is feudalistic. Universal suffrage is the only possible basis of equality of the races; so that the subjects of the Austrian crown re-

ceive the extension of the franchise not as a direct aim, but as a means of asserting their suppressed nationalities. The Emperor congratulates himself that revolutionary aspirations have not been awakened in his dominions, and that Nihilistic violence is unknown. The people are absorbed in their various national aspirations. Decentralization has acquired an irresistible impetus. The danger of a Russian war, and the German alliance, strengthen the throne and the German party, and preserve for the present the old bond. Magyars, Poles, and Germans are united against Russian aggression. The Government have favored the Ruthenians and other minor Slav nationalities which might waver in their allegiance. Liberty and federalism are seen to be the means of the empire's salvation. The Emperor draws out a sentimental attachment, while he is paying especial court to the nationalities; but when a federal system has been established the office of the throne will in a great measure disappear. The German bureaucracy, while the control over the Austrian populations is passing away from them, seek to perpetuate their mission by taking the Slavs of the Balkans in hand. But their methods have signally failed thus far with the fierce lovers of liberty who live in primeval Slavic unrestraint on the Bosnian highlands. If Austria could extend her sway by old-time rigor and repression, Hungary is unwilling to have the dual monarchy converted into a Slavic empire under German rule. The question of the definitive annexation of Bosnia and Herzegovina has not yet come to a final solution. The difference of view between the two co-ordinate Governments is almost as great an obstacle as the external difficulties. The Magyars are unwilling to sacrifice the principle of the dualistic Constitution to the extent of administering Bosnia perpetually as a dependency of the empire, and equally unwilling to have it attached to the Austrian crown. The only solution they deem equitable would be to incorporate it with the Hungarian dominions, but they would be unprepared to accept the gift with the attendant costs and responsibilities.

An attempt to organize a party on genuine liberal principles was attempted during the year, but neither the German Liberals nor the Slavs of advanced opinions showed a disposition to forget the racial conflict which is the question of the hour. The new party grouped itself around Robert von Walterskirchen, a Styrian deputy, who seceded from the Constitutional party and was selected as an independent on account of his advanced opinions on electoral reform; and Dr. Fischhoff, a prominent Liberal of 1848, who has held himself aloof from politics on account of the compulsion exercised by his party upon the minor nationalities which led to its downfall. Now that the embittered Czechs and Poles, in alliance with the Clericals and the Feudalists, have

beaten the German Constitutional party out of the field, these new leaders propose to concede to the Czechs and the other races the right to perpetuate their languages and nationalities, retaining, to the extent that the public interests require, German as the official language of the Government. The paragraph in the Constitution securing this right to each race they would give full effect to by legislative enactments. If the Germans will accept the situation now, as they must in the end, and give up the ethnic contest, the liberal elements of all the nationalities can unite in the pursuit of constitutional liberties. The programme of this growing party, which has purged its mind of the idea that forcible Germanization is a prerequisite of constitutional freedom, is of an advanced democratic character: universal suffrage, with the entire abolition of the representation of special interests in the Reichsrath; complete liberty of the press and the right of assembly; positive reforms for the benefit of the working-classes.

The dominance of German, even as the official language in Bohemia, is endangered. The civil servants already use their native tongue inside the offices. Aroused by the intentions of the Centralists to use state education as a means for exterminating their national tongue, the Czechs did not rest after expelling German from the common schools, but insisted on the instruction in all the intermediate and technical schools being given in Bohemian, and now have their national university. The Slovians have imitated the Czechs, and are struggling for the preservation of all the characteristics of their insignificant nationality. Prince Czartoryski is endeavoring to unite all the Slavs in a revolt against Germanizing tendencies.

While Austria is experiencing a transfer of political powers, which is in nature though not in form a political revolution, Hungary is occupied with no question more important than finance. The harvest was abundant, and the Government was never in a more favorable position. Koloman Tisza, the able Prime Minister, is the absolute master of the country, and has no rival and no organized opposition to disturb him. The chief problem of the Government at present is the reform of the system of taxation. The people have suffered much, and sometimes they have been provoked into resistance and riot by the exactions of the tax-collectors. The system of taxation is all in confusion, so that the evils may be remedied without reducing the revenues.

**INSURRECTION IN CRIVOSIA AND HERZEGOVINA.**—By stubbornly ignoring the wants of the people, the Imperial Government has, in three years of harsh maladministration, civil and military, greatly increased the difficulty of amalgamating Bosnia and Herzegovina with the empire. Austria entered upon the mission of extending her rule into the Balkan lands with the approval of Europe. The more intel-

ligent spirits among the populations of the peninsula looked hopefully to the prosperous and enlightened empire for deliverance from Turkish misrule, and for guidance and government. The dual monarchy inaugurated its rule in the provinces confided to it by the mandate of Europe with a ruthless war against the sturdy, freedom-loving mountaineers, which cost \$90,000,000, one quarter of which sum, if expended in productive works, might have won the hearts of the impoverished people. The nominal sovereignty which the Porte insisted upon preserving at the Congress of Berlin has become more shadowy and problematic since the Sultan has turned his attention to consolidating the Ottoman power in Islamic lands. The Pan Slavonic agitation has dwindled away, and the dreaded influence of Russian machinations, and of the ruble on its travels, has practically ceased since the Russians have given their thoughts to home problems. Yet, after three years' trial of the civilizing efforts of the Austro-Hungarian Government, a universal cry was heard in the occupied provinces, from Christians and Mohammedans alike, that the yoke of the Austrian was more cruel and intolerable than that of the Turk; and the Herzegovinians in their desperation arose again in open rebellion. The Imperial Government entered upon its task financially hampered as usual, for in the united monarchy money can never be had for imperial purposes when it is needed. Only a small party approved of the occupation in the first place, and after the blundering war of occupation the Government announced that no further appropriations would be required from the Parliaments, as the revenues of the provinces would suffice for their administration.

The Bosniaks and Herzegovinians were taxed for their own repression more heavily than they had been taxed by the begs and pashas. All the Turkish taxes were continued, and a host of *octrois*, tolls, license and excise taxes were superimposed, with, finally, the salt and tobacco monopolies. The Turkish taxes were severe, but the administration was lax; and the tax-gatherers, when seasons were bad, acknowledged the will of Allah, and took only what the raya could bring. The Austrian officials, entering this land exhausted by wars and insurrections, its stock destroyed and its industry unhinged, exacted the last penny of the augmented taxes. The cattle of the peasantry were driven off, their household goods and seed-corn taken, and their houses sold to the highest bidder. The Greek Orthodox and Roman Catholic population suffered most from this unaccustomed stringency of the administration. Many of the ruined emigrated into Turkish dominions, and many became mountain robbers and cattle-thieves.

While draining away the capital and paralyzing the productive forces of the people to pay for military roads, which were of no practical use, because wagons and draught-animals

were unknown, and for the elaborate systems of civil officialism and military occupation, which were felt to be a twofold tyranny, the Austro-Hungarian Government did nothing to remove the peculiar grievance which had excited the Herzegovinian outbreak of 1875 that led to the Servian and Turkish wars, and furnished the ground of Count Andrássy's famous note of December 30, 1875, with which the diplomatic campaign against the Porte was inaugurated. The agrarian question was referred to a Bosnian commission, which simply revived an old Turkish law enabling the landlords to collect their rents by the aid of the military. The Mohammedan proprietors—the aristocracy of the country—were propitiated, lest their complaints to the Porte might interpose an obstacle to annexation. But the Christian agriculturists it was sought to assimilate by disciplining them in the rigorous regulations of Austrian officialism, and by the violent obtrusion of the German language and the Roman Catholic religion.

The vexatious over-government into which this wild and simple people were initiated, brought no compensating advantage over the loose and negligent *régime* of the Osmanli. Even the administration of justice, which, if capricious, was speedy and available in Turkish times, was now worse; for the people would not accept the elaborate procedure of the new courts.

In October, 1881, the law introducing universal military service in the occupied provinces was published. The recruiting was to commence in the March following. To conciliate the wealthy Mohammedans, the law was modified to permit the hiring of substitutes. The Porte raised no objections, asking only that the Mohammedan conscripts should not be employed in foreign operations, and might be permitted to wear the fez. To the Christians the conscription law was not less obnoxious than to the Mohammedans. It was felt to be the most oppressive measure to which they had yet been subjected, for under Ottoman rule the Christians had been entirely exempt from military duty, paying instead a capitation tax of about a dollar yearly.

There was every prospect that the people of the occupied provinces would resist vigorously the enforcement of the conscription law. The difficulty was complicated by the circumstance that compulsory military service had never been fully introduced in Dalmatia. The Crivoscians were exempted from military duty, as well as from taxes, tithes, and other public burdens, by a solemn charter repeatedly renewed. When the Government, in the reorganization of the military system of the empire, attempted to annul this privilege, a portion of the Dalmatians submitted to the conscription, but the Crivoscians rose in arms, destroyed a detachment at Fort Dragalj, and routed General Auersperg's army. His successor, Rodich, submitted to their terms, agreeing not only to

their immunity from military service, but granting them an indemnity of forty florins per head. After their ancient privileges were thus reaffirmed by the treaty which was struck at Kneslac in February, 1870, no attempt was made to impose the conscription laws upon the South Dalmatians until it was thought necessary to subject them to the system of universal military service before applying it to their kindred in Herzegovina.\*

Preparatory to the introduction of this disciplinary means of civilization in the occupied provinces, General Rodich, then Governor of Dalmatia, was instructed in 1880 to carry out the militia law in the district of Cattaro. He professed himself able to execute the law, but asked time to prepare the people. Nothing was accomplished that year nor the next; yet when summoned to Vienna, just before the issuance of the order for the occupied provinces, he still declared that his moral influence would be sufficient. A meeting of the Crivoscie people at Risano had previously declared that they would only comply with the law on certain conditions, which were rejected at Vienna.

Relying on the assurances of General Rodich, the military law for Bosnia was published October 24th. Before the Delegations separated, the people of the Crivoscie rose in revolt against the conscription. The insurrection spread from the Bocche di Cattaro into the adjacent part of Southern Herzegovina. It was re-enforced and controlled from the beginning by Herzegovinian malcontents, who hastened through Montenegro to the scene of disturbance, and by Montenegrin allies, headed by experienced guerrilla chiefs. Support and encouragement were received from a party of the Montenegrians and of the Servians, and from professional agitators of the Panславist cause. Although the Austro-Hungarian Government gave out that it had to do only with the forays of robber bands, military precautions were taken betimes. Rifle battalions were sent into the Crivoscie. A cordon was drawn around the insurrectionary center. The Prince of Montenegro took what slight measures he could to prevent re-enforcements from reaching the insurgents. He stationed a guard along the border, and the Austrians formed a second cordon, but both were insufficient to keep out the guerrilla bands, coming by secret trails through the mountains.

The district of Crivoscie is hardly sixteen square miles in extent, and contains but fifteen villages, with 1,600 inhabitants. The recusant conscripts are a tall, handsome, muscular race

\* When Dalmatia was incorporated into the Austrian dominions, after the Peace of Campo Formio in 1797, the inhabitants fought for the preservation of their ancient privilege of immunity from military service. This right, which they had enjoyed under the Venetian dominion ever since their subjugation in 1420, was formally conceded, and in 1814 reaffirmed. They have fought in the wars of Austria as volunteers—for example, in the war with France and Italy in 1859, when the Bocchese furnished a body of 2,800 men; but, for seventy years, their exemption from compulsory levies was duly respected by the Austrian Government.

of men. They have never been subdued, and know no law or discipline. Their raids into the neighboring Turkish territory have earned them the epithet of "Sheep-stealers." The difficulties of a military expedition in their district and in the adjacent parts of Herzegovina are incredible. The conformation of the land is the same as in Montenegro. An army must advance in the intricate mountain-paths, often in single file, and throw a bridge across every one of the numberless torrents. They must transport on pack-animals their ammunition, their cannon in separable parts, all their food and provender, and even their drinking-water. In the occupied territory 1,830 kilometres of roads were built in three years; but in the Crivoscie there are no means of communication but the difficult bridle-paths. The agile mountaineers have no need of paths, but can shoot down upon the toiling column from every cliff, and disappear without a trace. They can beset them anywhere on the flank or in the rear, or drive away the flock which is destined for the soldiers' meals. In military operations in such a country it is necessary to fortify and garrison every point of importance, every bridge that is built, every source of supplies. For this purpose the *kulas*, or block-houses, which are scattered through the country are of importance. They are built of rough stones, with towers pierced with slits for rifles. In peace-time they furnish nightly shelter to the patrolling gendarmes. The *hans*, or way-side inns, serve as gathering-places for insurgents, and the landlords are their zealous spies.

The district of Cattaro furnished its recruits in obedience to the order of October 24, 1881. The inhabitants of the Crivoscie only opposed a passive resistance, and when the commune of Ubl was preparing to send its quota the other Crivoscians drove its cattle up into the mountains as security for its fidelity. Detachments of riflemen were sent into the district. On the approach of the soldiery, several hundred men collected in bands. They were armed with Martini rifles. Raids were made on the neighboring districts. Skirmishes with the troops commenced in December. Some of the corpses of the fallen were found with the ears and noses cut off, a form of mutilation customary with these savage mountaineers. Their threat to put to the sword every captive soldier of Bocchese birth was not carried into effect.

By January all Herzegovina east of the Narenta was aroused, up to the southeast Bosnian border. The insurgents concentrated with strategic sagacity at a point near Fotcha, which commanded the communication between Serajevo and the Austrian forces on the Drina; in the vicinity of Konjica, on the lower Narenta, a point which commands the only military road leading from Bosnia into Herzegovina; and near Korito on the Montenegrin frontier. The

isolation of the Crivoscie by a military cordon had proved a complete failure.

With the spread of the insurrection into Herzegovina the Austrian Government was confronted with the danger of a European war. A military credit was voted by the Delegations. The command of the operations for the suppression of the insurrection was given to the young and energetic Lieutenant-Field-Marshal Jovanovics. The number of the insurgents was variously estimated at from five to fifteen thousand. They were armed throughout with breech-loaders. The heated language of General Skobeleff and several Russian statesmen, the collection of money and war material by native and foreign Slavic agitators, the activities of the Young Servian League of the Omladina, and the direct aid in munitions and supplies given by the inhabitants of Montenegro, furnished the elements for another conflagration in the Balkan Peninsula.

The insurgents presented in the beginning of February an irregular line from Trebinje through Liubnje, Bilek, and Gatzko to Nevesinje, and

through the wild mountains of Zagorje, where they concentrated in the greatest force, to Fotcha, and beyond as far as Cainitcha. Behind the way of escape into Montenegro or the Sanjak of Novi-Bazar was open. Over a thousand of them, under Dandalitch and Sekanovitch, held the advanced post in the valley of the Zeljeznika, an affluent of the Drina, south of Serajevo. In Fotcha and the Zagorje the Sirdar Tungus commanded; in Nevesinje, Gatzko, and Bilek the redoubted brigand Stojan Kovatzevitch; in Zubzie, near Korito, Tripko Fukalovitch; around Trebinje, Tomasevitch; and in the Crivoscie, Militch and Sutitch. They had a fully equipped mountain battery, and pursued systematic plans under the direction of some

unknown strategists. In fight they gathered sometimes eighteen hundred strong. In the intervals between their attacks they were hidden in scattered bands in the gorges of the mountains.

General Jovanovics had a force of 40,000 men with 56 mountain-guns, composed of the garrisons of the coast-lands and several regiments sent on to the seat of war. They were formed into so-called mountain brigades. The signal service, sanitary arrangements, and commissariat were admirably organized. Jovanovics assumed the command of the forces in Herzegovina and the Crivoscie on the 6th of February. In Herzegovina his authority was unfortunately divided with General von Dahlen, the civil and military governor of the occupied provinces. The insurgents proposed peace at once to the new general; but he rejected their stipulations for universal amnesty. He proposed to wait for open weather, organize his army for the difficult service for which it was none too large, and drill the troops in rifle practice. But General von Dahlen urged an immediate advance, and on the 9th of February the forward movement began from Mostar, where General Jovanovics had established his headquarters. On the same day Risano, the chief town of the Crivoscie, was captured by the help of the fleet in the Bocche; and Ledenice, the center of the insurrection in the Crivoscie, was taken by storm. The insurgents were thus at the start cut off from all aid coming by sea, and separated from the southern coast district, the Primorje. Nevertheless, they boldly took the offensive, and on the 10th and the following days struck at Fotcha, an important central position, and at Tirnova, and attacked the fortified height of Rogai. Their object was to spread the insurrection into the interior of Bosnia. They were repulsed, and on the 14th the ridge of Zimje Polje, east of Mostar, was occupied, and its commanding points fortified. After these first successes the movement of the Austrian troops was slow and difficult. There were no communications between the different columns. Each pressed forward on a converging line toward the center of the insurrection. Their object was to get between the insurgents and the frontier. Until they could be cut off from Montenegro, the enemy were unapproachable. They could disappear when hard pressed, and reappear to attack the Austrians where they were weakest. Montenegro was impelled by the success of these tactics, and by the promise of the Austrian Government to bear the whole cost, to strengthen her boundary cordon, and place more trusty officers in command. There was no opportunity for strategic combinations. The Austrian lines had to contend sharply for every step of their progress. Bravery and perseverance were displayed by the troops, and quite as much discipline and fortitude were exhibited in the resistance of the insurgents. In the fights which took place almost daily the Austrian regulars were many times worsted.

The Austrian soldiers did not forget the strict discipline for which they are distinguished; but their commanders adopted stern and cruel measures for crushing out the rebellion. Their path was marked by smoking villages.

About the 20th of February the insurgents collected in great number in the plateau of Zagorje, a natural stronghold which they deemed impregnable, for the purpose of striking a blow at Serajevo. The Austrians advanced in four columns from different points, with the object of surrounding them. The access to the plateau is very arduous, and they were impeded by snow and storm. After several days of fighting, in which a number of positions were carried by assault, the Austrians occupied the plateau\* on the 25th. Yet they did not succeed in entrapping the enemy. The insurgents escaped on the right bank of the Drina toward the Montenegrin frontier. The Knez of Zagorje made his submission. The people of the district were famishing, and food was distributed by the authorities. Another column in a sharp assault carried the steep heights at Ulok, east of Mostar, and drove the insurgents over the Narenta. Worn out in daily battles, the insurgents of Herzegovina were gradually pressed back upon a strip of land skirting the Montenegrin frontier. In the Crivoscie the right wing of the Austrian army was not idle. After taking Bratlo and Ubli, the insurrection was confined to the wedge of land which projects into Montenegro. By the capture of Fort Dragalj, on the 10th of March, the last of the insurgents were driven over the border. The insurrection, as an organized military movement, was broken up. The Austrian soldiery held the land. Flying columns traversed the country, and met with little resistance. The inclement weather told severely on the Austrian troops, but their losses in battle were remarkably light, being only 53 dead, and 210 altogether.

On April 22d Freiherr von Dahlen issued a proclamation to the inhabitants of the occupied territory, announcing the final suppression of the insurrectionary movement, and inviting them to return to their homes. He promised amnesty to all but the leaders. The Austrian army had won the campaign, but it was a hollow victory. When they came into possession of the country it was a desert. They found only burned villages and deserted farmsteads. The inhabitants had emigrated in a mass to Montenegro with their families and their flocks and herds. From there they continued to return in bands to harass the troops. The Crivoscie was absolutely empty of inhabitants. The Montenegrin authorities arrested and disarmed the immigrants, but were at a loss what to do with them. At the instigation of the Austrians the Government cut off the rations which were supplied out of its limited means

\* This almost inaccessible stronghold the Turks did not attempt to assail in 1875, but contented themselves with a siege.

and tried to drive them back to their homes, but with indifferent success.

At the meeting of the Delegations in April, the Common Ministry asked for 23,730,000 florins to defray expenses in South Dalmatia and the occupied provinces until October, in addition to the military credit of 8,000,000 florins granted at the special meeting of the Delegations on January 28th. The Hungarian Delegation took this opportunity to overhaul the Bosnian policy of the Government. The Minister of Finance, Count Szlavy, explained that the conscription in Bosnia would be confined to recruiting 1,200 men, who would not be removed from the country, and was only intended to enforce the principle that it is the duty of the people to take part in the defense of their boundaries. The conscription is a direct infringement of the Treaty of Berlin. In the administration of this practically annexed territory the Austrian Government goes through the form of submitting every proclamation to the Porte. The Turkish minister revises and alters it, but it is always issued in the original shape. The Hungarian Delegation cut down the appropriation for fortifications and other items. Count Szlavy resigned in consequence. In the Hungarian Lower House the reduced appropriations were warmly contested. In the Upper House, Count Deseffy, who was for three years chief administrator of the district of Serajevo, unfolded all the mistakes and abuses of the Bosnian administration. Tisza, the Hungarian Premier, admitted that the Bosnian bureaucracy needed a thorough purification. In deference to the determined attitude of the Hungarian opposition, after Szlavy had continued his functions for nearly

a month, awaiting his successor, Baron Kallay, a Hungarian statesman, but a friend of the Slavs and believer in the Slavic extension of the empire, was appointed Common Minister of Finance. The post might be better described as the ministry for Bosnian affairs. The programme to be carried out was the reversal of the obnoxious German methods, and an administration according to Slavonic notions and customs. As an initial reform, a separate Civil Governor of Bosnia was appointed, the choice falling upon Count Rudolf Khevenhüller, who, like M. de Kallay, is familiar with the southern Slavs and their languages. The elaborate machinery of the law, which was introduced after European models, was first done away with, and the decision of cases made speedy and inexpensive. No lawyers nor briefs are necessary in petty suits, and in larger ones only one appeal may be heard.

INUNDATIONS IN TYROL.—Various parts of Europe were visited in 1882 by devastating floods. In the Alpine regions the abnormal rain-fall wrought the most destruction, and nowhere so great as in the valleys of Austrian Tyrol, where the losses exceeded 30,000,000 florins, or \$13,000,000. An inundation occurred in the middle of September, the effects of which were partly averted by the energy of the authorities. On the 28th of October the people were driven out of Bruneck, Toblach, Innichen, and the hapless Welsberg, by one of the most destructive floods that is recorded in history. The protective works were destroyed, towns almost annihilated, farms not only stripped of harvest and improvements, but left desolate under a layer of silt and boulders.

## B

BAPTISTS. I. REGULAR BAPTISTS IN THE UNITED STATES.—The following is a summary of the statistics of the Regular Baptist

churches in the United States, as they are given in the "American Baptist Year-Book" for 1882:

STATES AND TERRITORIES.	Associations.	Churches.	Ordained ministers.	Total members.	STATES AND TERRITORIES.	Associations.	Churches.	Ordained ministers.	Total members.
Alabama.....	71	1,751	1,014	167,650	Missouri.....	70	1,448	847	95,176
Arizona.....	1	1	1	14	Nebraska.....	11	136	68	4,808
Arkansas.....	50	1,149	655	54,805	Nevada.....	..	2	1	110

Massachusetts.....	14	291	346	48,994	Wyoming.....	..	2	2	101
Michigan.....	18	357	322	26,844					
Minnesota.....	9	159	71	6,985					
Mississippi.....	68	1,554	879	126,984	Total United States..	1,155	26,873	16,514	2,386,022

Whole number of Sunday-schools, 14,473, with 120,678 officers and teachers, and 1,006,412 scholars; number of additions by baptism during 1881, 81,570. Total amount of benevolent contributions, so far as reported, \$4,600,910. Number of theological institutions, 8, with 41 instructors, 447 students for the ministry, \$1,925,803 of property, and (in five institutions) \$1,320,649 of endowment funds; number of colleges and universities, 33, with 295 instructors, 4,690 students (of whom 784 were young women and 557 were studying for the ministry), \$8,085,950 of property, and \$3,698,619 of endowment funds; number of academies, seminaries, institutes, and female colleges, 53, with 390 instructors, 6,201 students (of whom 3,676 were young women, and 445 were studying for the ministry), \$2,500,780 of property, and (sixteen institutions) \$416,286 of endowment funds.

The statistics show an increase during the year of 25 associations, 313 churches, and 39,695 members, with a decrease of 82 ordained ministers and 21,154 baptisms.

The "Year-Book" gives the following general statistics of the Regular Baptists in all countries for 1881:

	Associa- tions.	Churches.	Ordained ministers.	Members.
North America (Includ- ing the United States).	1,179	27,213	17,106	2,429,118
South America (Brazil).	8	8	4	215
Europe.....	61	3,039	2,111	328,076
Asia.....	4	596	168	44,358
Africa.....	2	60	44	8,697
Australasia.....	4	143	95	7,918
Grand total.....	1,290	31,084	19,528	2,818,377

Total number of baptisms reported for the year, 118,927.

#### NORTHERN BAPTIST BENEVOLENT SOCIETIES.

—The anniversaries of the Northern Baptist Societies in the United States were held in the city of New York, beginning May 24th with the meeting of the *American Baptist Home Mission Society*. As this meeting marked the completion of the fiftieth year of the society's existence, the regular proceedings were supplemented by special jubilee services. The general receipts of the society for the year had been \$359,306, or \$124,273 more than the receipts of the previous year, which had been the largest recorded to that time in the history of the organization. A debt of \$29,955, which stood against the society at the beginning of the year, had been fully paid; and there now stood a balance in the treasury, available for the coming year's operations, of \$7,512. Seventy-five churches had been organized, 1,460 churches and out-stations supplied, and 1,675 members received by baptism, during the year. The mission churches returned a total membership of 21,181 and 819 Sunday-schools, with 38,575 attendants, and had contributed to benevolent funds the total sum of \$14,375. During the fifty years of its existence, the so-

ciety had issued 9,102 commissions to missionaries and teachers, through whose agency 2,838 churches had been organized and 87,056 persons had been baptized. Twelve educational institutions among the colored people in the South, or two more than were reported in the previous year, were receiving assistance from the treasury of the society. The new institutions were "Bishop Baptist College," at Marshall, Texas, and the "Kentucky Normal and Theological Institute," at Louisville, Ky. In all of these schools, 79 teachers were employed, and 2,151 pupils, 400 of whom were preparing to preach, were enrolled. The sum of \$39,964 had been paid for teachers' salaries, and the students had paid in \$22,331 for tuition, board, and room-rent. Dr. J. M. Gregory had been appointed superintendent of the society's educational work "among the colored people, the Indians, and others to whom it may be extended." Twelve missionaries, nine of whom were natives, were under appointment in the Indian Territory, and reported 896 members of the church and 1,148 persons in Sunday-schools. The Indian University at Tahlequah was attended by 69 students, four of whom were preparing for the ministry. Recommendations were made concerning the enlargement and more thorough equipment of this school, and for the sending of missionaries as soon as practicable among the Indians of Alaska. The Chinese mission at Portland, Oregon, with 50 members, had contributed \$85 to the jubilee fund of the society. The missionary work in Mexico, resumed a year before, was carried on by the Mexican Missionary Society in co-operation with this body. A general missionary was supported in this work, and another missionary had been commissioned. The 8 churches returned 156 members. Forty-six missionaries were employed in co-operation with the Eastern and Western German Baptist Conferences, among the German population. The missionary work among the Scandinavian settlers had resulted in the building up of about 120 churches, with 6,500 communicants. A Scandinavian department was connected with the Theological Seminary at Chicago.

The *American Baptist Publication Society* had received during the year \$345,632 in the business department, and \$107,784 in the missionary department. It had issued twenty-nine new publications and 308,000 copies of all publications; had expended \$3,517 in grants of Bibles and Testaments; and had employed 81 missionary colporteurs and 35 Sunday-school missionaries, through whose agency 13 churches had been constituted, 422 Sunday-schools organized, and 433 persons baptized. A resolution was adopted, requesting the Boards of the American Baptist Publication Society, the American Baptist Missionary Union, the American and Foreign Bible Society, the Southern Baptist Convention, and the three Baptist Conventions of the Dominion

of Canada, to appoint committees of conference on the best method of uniting Baptist Bible-work in America. The object of the committee was specified to be to submit a plan for the readjustment of the Baptist Bible-work, covering both translation and circulation, and to designate the methods by which it can be done efficiently and to the satisfaction of the denomination as a whole.

The total receipts of the *American Baptist Missionary Union* for the year had been \$352,787, of which sum \$157,989 were from donations, \$54,462 from legacies, and \$59,102 from the Women's Societies. The total expenditures had been \$353,183, leaving a balance against the treasury of \$396. The report on Bible-work recorded the progress that had been made in the publication or translation of the Bible in the Karen, Garos, Shan, Japanese, Telooqoo, and German languages. The following is a summary of the condition of the several missions of the Union:

ASIATIC MISSIONS.	Missionaries.	Native preachers.	Churches.	Members.
Burmah .....	96	488	471	28,488
Assam .....	17	87	29	1,765
Teloogoo, India .....	29	94	89	18,992
Chinese (including Bangkok, in Siam) .....	25	84	40	1,582
Japan .....	13	10	8	185
Total .....	181	663	587	46,017

Of the native preachers, 190 (126 in Burmah, 9 in Assam, 46 in India, 7 Chinese, and 2 in Japan) were ordained, and 473 (362 in Burmah, 28 in Assam, 48 in India, 27 Chinese, and 8 in Japan) were unordained.

EUROPEAN MISSIONS.	Missionaries.	Native preachers.	Churches.	Members.
Sweden .....	....	160	815	19,920
Germany .....	....	350	146	28,088
France .....	....	18	9	738
Spain .....	....	4	8	150
Greece .....	....	8	1	7
Total .....	....	535	474	48,862
Total for the whole work .....	181	1,198	1,061	94,879

A resolution was adopted accepting the invitation which had been made by the Publication Society to appoint a committee to confer with similar committees of other Baptist societies in reference to a readjustment of their Bible-work.

The *American Baptist Historical Society* reported its year's receipts to have been \$224, and its expenditures \$157.

The regular receipts of the *American and Foreign Bible Society* for the year preceding its last anniversary were \$11,028, and its expenditures \$7,007. The society had, furthermore, received the sum of \$2,000 in bonds and 413 acres of land in Illinois.

The receipts of the *Woman's Baptist Foreign Missionary Society* were returned at \$56,132, and its expenditures at \$55,819. Thirty-eight

missionaries and 49 Bible-women had been employed during the year, and aid had been given to 84 schools, in which were reported 2,170 pupils and 175 baptisms. The *Woman's Foreign Missionary Society of the West* had received and expended \$23,578. Two additional missionaries had been sent out.

**SOUTHERN BAPTIST CONVENTION.**—The *Southern Baptist Convention* met at Greenville, S. C., May 10th. The Rev. P. H. Mell, D. D., of Georgia, was chosen president. The Home-Mission Board had received \$28,370; adding to this the funds reported by the several State Home-Mission Boards as having been received and expended by them, the total sum of \$94,273 was shown to have been contributed by the Southern Baptist churches for the purposes of this work. The operations of the board were conducted at various points in the Southern States otherwise not provided with Baptist churches, among the Indians, and among the Chinese in California. The buildings of the Levering Manual Labor School, in the Creek Nation, had been completed, furnished, and paid for during the year. The cost of the school had been \$10,340, and it had an assured annual income of \$8,400. It was attended by 120 pupils. Four missionaries had been employed among the Chinese in San Francisco, California, and had the charge of schools for Chinese boys. The Foreign Mission Board had received \$49,041, or \$5,000 more than during the previous year, with which all its expenses had been paid, and it was now out of debt. Its missions were in Italy, China, Africa (the Yoruba country), Brazil, and Mexico, and included in all 34 stations, at which 61 missionaries and native assistants were employed. The whole number of native members was 740, of whom 126 had been baptized during the year. Eight new missionaries had been sent out, and six candidates had applied for appointments. The English language was beginning to be taught in the Chinese mission-schools. The heathen converts were contributing nearly a dollar each for benevolent purposes, and the women in the African missions were sustaining a native missionary.

**BAPTIST AUTUMNAL CONFERENCE.**—A Baptist Autumnal Conference, on the plan of the autumnal conferences held by the English Baptist and Congregational bodies, was held in Brooklyn, N. Y., November 14th, 15th, and 16th. It was the first meeting of the kind attempted by Baptists in the United States, and was called as an experiment. The Rev. George Dana Boardman, D. D., of Philadelphia, presided. Papers were read and discussed on "Skeptical Drifts in Modern Thought" (Rev. L. Moss, D. D., and Rev. E. H. Johnson, D. D.); "The Economics of Foreign Missionary Effort" (Rev. George E. Merrill and President A. H. Strong, D. D.); "The Church and the Children" (Rev. A. J. Sage, D. D., Rev. John Humpstone, Professor A. E. Waffle, and others); "The Labor Question" (A. J. Fox); "Charities" (Rev. J. M. Gregory, LL. D., and Hon.

Francis Wayland, LL. D.); "Race and Religion on the American Continent" (J. M. Hoyt, LL. D., President E. G. Robinson, and Hon. George Williams); "Diversity of Opinion within the Limits of Denominational Unity" (Rev. W. C. Wilkinson, D. D., on diversity of opinion on questions of Church polity, and Rev. C. B. Crane, D. D., on diversities of doctrinal views); "The Taxation of Church Property" (Hon. George H. Andrews and others); "Modern Evangelism" (Rev. A. J. Gordon, D. D.); and "The Meditative Element in Christian Life" (President H. G. Weston and others). It was determined to hold another conference in the autumn of 1883, at Boston.

II. SEVENTH-DAY BAPTIST CHURCH.—The following is a summary of the statistics of this Church as they were reported to the General Conference of 1882:

Eastern Association (16 churches in Rhode Island, Connecticut, New York city, and New Jersey).....	2,216 members.
Central Association (15 churches in Central New York).....	1,661 "
Western Association (30 churches in Western New York and Pennsylvania).....	1,981 "
Northwestern Association (34 churches in Ohio, Illinois, Wisconsin, Iowa, Minnesota, Kansas, Missouri, Kentucky, Nebraska, and Dakota).....	2,230 "
Southeastern Association (6 churches in West Virginia).....	648 "
Foreign (2 churches in England, 1 in Holland, and 1 in China).....	50 "
Total.....	8,781 "

Net increase of members during the year, 155. The whole number of Sabbath-schools was 93, with 6,211 scholars, or 810 more scholars than were reported in the previous year.

The receipts of the *American Sabbath Tract Society* for the year ending August 31, 1882, were \$8,294, and its expenditures were \$8,085. The society returned a balance of \$2,379 of assets over liabilities. It had employed agents in Pennsylvania, Haarlem (Holland), where a monthly journal was published on its account, and in Norway and Hamburg, Germany, where 7,916 tracts had been distributed; and it had organized a system of work by tent-meetings, to be held at different places in the United States. It published a general religious newspaper, a Sabbath-school journal, and a monthly journal designed especially to present the views of the denomination to the public, and which has been sent to clergymen, Sunday-school workers, and public reading-rooms throughout the United States and Canada.

The funds of the *Seventh-Day Baptist Education Society* were reported at its annual meeting, September 22d, to be in amount \$44,004. Reports were presented at the meeting of the condition of Milton College, Milton, Wis., and Alfred University, Alfred Center, N. Y. The former institution returned an income of \$8,067, a faculty of nine members, and 241 students. Ten thousand dollars had been added during the year to the endowment fund of the college. Alfred University returned an income of \$8,783, a general faculty

of thirteen, with a theological faculty of five members, and 378 students.

The receipts of the *Seventh-Day Baptist Missionary Society*, for the year ending September 21st, were \$9,330. The society sustained both home and foreign missions. Twenty-three home missionaries were employed in eleven States, and reported the organization of three churches, fifty additions by baptism, and a total of 858 church-members and 575 persons in Bible-schools. The foreign mission at Shanghai, China, was conducted by three American missionaries, with two native preachers, one Bible-woman, and three teachers of day-schools, and returned 40 pupils in the Bible-school and 52 pupils in three day-schools. A missionary was employed at Haarlem and Workum, in Holland, where were returned twenty-five church-members.

The sixty-eighth annual session of the *Seventh-Day Baptist General Conference* was held at Hopkinton, R. I., beginning September 20th. Professor A. R. Crandall presided. A new church at Cartwright, Wis., was admitted to the conference. The increase in the number of members that had taken place during the year was reported to have been greater than the average annual increase of the previous five years. Progress toward the preparation of a denominational history was reported in the collection of material and in securing the preparation of original histories and memoirs. Professor William A. Rogers was elected president of the conference for the ensuing year.

III. THE BRETHREN, OR TUNKERS.—The differences of opinion which have prevailed and have been widening for several years among the Brethren, or Tunkers, have finally resulted in a definite schism; and the Church is now divided, in effect, into three branches, which are called the Old Order, the Conservatives, and the Progressives. The Old Order Brethren represent a local schism which occurred in 1881 in the Miami Valley, Ohio. They do not differ in doctrinal points from the Conservatives, but believe, as to points of practice, that the Church has erred "in encouraging protracted meetings, high-schools, Sunday-schools, and prayer-meetings, and in departing, to some extent, from the ancient order in dress and other matters, such as the use of musical instruments, etc." Their first meeting in 1882 was held in Brookville, O., and was attended by about six thousand persons, most of whom, it was remarked, were aged. The meeting made rulings against "fashionable mustaches," the parting of the hair on one side, the use of more than one color in house-painting, the wearing of silk and dress-trimmings by women, the raising of tobacco, and the selling of grain to be distilled.

The regular *Annual Meeting* of the Brethren was held near Milford Junction, Ind., in June, and was attended by ten or twelve thousand persons. The full privilege of voting was granted to the sisters. The most important

business of the meeting was the consideration of the case of H. R. Holsinger, one of the editors of the "Progressive Christian," who was charged with having published unwarrantable criticisms of certain customs observed by the Brotherhood, and with having caused divisions. The committee, to which the case had been referred by the previous Annual Meeting, reported recommending that Mr. Holsinger be expelled, and added to their recommendation a statement that the church at Berlin, Pa., of which the accused was a member, had refused to allow the trial which had been instituted against him to proceed secretly, as in the ordinary way, and had insisted on the presence of a short-hand writer to take a minute of the proceedings. Mr. Holsinger's friends made several efforts to bring him and the meeting into accord, but their offers were rejected, and the report of the committee was adopted by an overwhelming majority. A memorial was afterward presented from Mr. Holsinger's side asking that a committee, one half of whom should be Conservatives and one half Progressives, be appointed to prepare a plan for "a general reconciliation between the Annual Meeting and all the Brethren called Progressives," but the standing committee declared it could not entertain the proposition. The meeting ordered that all the decisions of the Annual Meeting should be mandatory instead of advisory; that any one who should "speak or write anything reproachfully against the Annual Meeting, or the practice, order, and usages of the Brethren," should be dealt with as an offender; that the Church papers should be consolidated, in order that the Brotherhood might hereafter have control of the press; and forbidding fellowship with the Progressives, recognition of them, or preaching in their churches.

This action was followed by a conference of the Progressive party, which adopted a preamble reciting that, "inasmuch as Christ gave his people a complete plan of salvation, containing neither too much nor too little; and inasmuch as no church, during all the history of the past, has successfully made additions to or subtractions from it through mandatory legislation without discord and trouble; and, inasmuch as reformations have universally tended to reaffirm the primitive doctrines of Christ, by divesting them of accumulated decrees, enactments, and laws made by church-leaders, which always tended toward abridging God-given liberty; and that church legislation has had a tendency in all ages to run into power, and the history of Christendom is full of examples of suffering and ostracism, as its legitimate offspring;" alleging that the spirit of intolerance had frequently been manifested in the Church in the expulsion of brethren and sisters "for no violation of gospel or moral principle," and had just been freshly illustrated by "what appears to us an act of injustice"; pointing to the fact that the Annual Conference was "almost wholly

taken up with legislation tending to abridge our liberties in the Gospel, enforcing customs and usages, and elevating them to an equality with the Gospel, and defending them with even more rigor than the commandments of God," and that the conscientious opposition of the Progressives to these proceedings had caused them to be styled "troublers" and "railers," and exposed them to reprobation; expressing sympathy and fellowship with all who had been expelled "without a violation of the gospel," and opposition to all tendencies toward intolerance and corruption of doctrines, and reaffirming the doctrines of the gospel as the only rule of faith and practice, and the doctrine of the Church "as it existed in its earlier and purer age, before it was corrupted by the additions made by elders and their abuse of power." A convention of all Brethren sharing in these views was called, to meet at Ashland, O., June 29th.

The convention was attended by between two and three hundred persons representing the progressive element in their several localities, and continued through two days. J. W. Beer was elected president. A preamble was adopted, in which were stated the grounds of complaint against the Annual Meeting, together with a declaration of principles reaffirming the doctrines of Alexander Mack, asserting that this convention represented the true, original Church of the Brethren, and setting forth provisions for the organization of conferences. Committees were appointed to publish the declaration; to confer with other branches of the Brotherhood; and to take the care of Sunday-school, educational, and missionary work. A subscription was taken up for Ashland College. Delegates were present at the conference representing a small body of a few hundred members, an offshoot from the Brotherhood, called the "Congregational Brethren," and another body, called the "Thurmanites," of Virginia, both of which proposed union with the Progressives. No definite action was taken on these propositions.

The position of the Progressives is thus defined by one of their journals, "The Gospel Preacher":

The Progressive believes in non-conformity, humility, and all the other attributes taught by the Conservative or Old Order Brother; but he renounces the decisions of men where there is doubtful gospel authority, he pleads for liberty of speech and of the press, advocates high-schools, Sunday-schools, prayer-meetings, and encourages the missionary work. Claiming that uniformity is not taught in the gospel, he opposes its being made a test of fellowship or official standing. He maintains that the world is advancing, and that, to keep pace with it, the Christian must choose all the good from the improvements and utilize them.

IV. MENNONITES.—The first General Conference of the *Evangelical Mennonites*, a branch formed within a few years by the union of two small bodies, was held in Indiana in September. Three conferences were represented by delegates. A course of reading for young ministers was prescribed. Resolutions were adopt-

ed making the term of the General Conference three years, and that of presiding elders one year; refusing fellowship to persons who take out insurance policies, who violate the Scripture rule of divorce as laid down in Matthew and Mark, and who use tobacco. The churches were prohibited having organs and choirs; and a system of raising funds for foreign mission work was adopted.

#### V. REGULAR BAPTISTS IN GREAT BRITAIN.

—The "American Baptist Year-Book" for 1882 gives the following statistics of the Regular Baptists in Great Britain and Ireland for 1881:

COUNTRIES.	Associa- tions.	Churches.	Ordained ministers.	Members.
England .....	88	1,893	1,360	203,304
Wales .....	9	594	344	67,859
Ireland .....	1	30	17	1,251
Scotland .....	1	88	79	9,284
Total .....	44	2,545	1,800	281,648

The "Baptist Hand-Book" for 1882 gives for the United Kingdom 2,586 churches, 3,395 chapels, 1,101,361 sittings, 295,035 members, 46,321 teachers and 433,801 scholars in Sunday-schools, 1,885 pastors in charge, and 3,247 evangelists.

The annual meeting of the *Baptist Union of Great Britain and Ireland* was held April 24th. The Rev. John Jenkyn Brown, of Birmingham, was president for the year. Returns had been received from 2,586 churches, with a reputed membership of 295,000, as against 2,565 churches and 281,000 members reported in the previous year. Nearly 50,000 sittings had been added to the chapel accommodation, giving 1,101,000 sittings, against 1,052,000 reported in the previous year, and school-rooms had been provided to accommodate 8,000 Sunday-school children. Chapel debts had been diminished by more than £124,000. Not less than £20,000 had been raised for evangelistic work in the several counties, including that of the British and Irish Baptist Home Mission. Some changes in the constitution were agreed upon, with the object of making it possible for the Union to become legally amalgamated with the British and Irish Baptist Home Mission. According to the new provisions, the governing body of the Union will consist of a council of one hundred members, seventy of whom are to be chosen by ballot, and the rest elected by the members thus chosen. The officers of the Union and of the Baptist Unions of Scotland and Wales will be *ex-officio* members of the council, and societies or organizations accepted by the Union as auxiliaries to any of its work will be empowered to appoint a representative who shall be entitled to attend and vote at the meetings of the council. The actuary of the annuity fund reported that an additional annual income of £400, or an augmentation of the capital to £100,000, was needed to keep the annuities at their present annual value of

£45 for each minister and £39 for each widow on the list. The committee was instructed to procure the opinion of counsel respecting the interpretation of the rule which deals with funds the investment of which has been specially prescribed by the donors. The *Baptist Building Fund* had aided with £25,000 in the erection of twenty-five new chapels and the enlargement of other chapels, by which a clear increase of 7,646 sittings was gained. The total cost of the new erections had been £83,770. The *Bible Translation Society* had expended £2,665 in the prosecution of its work, and had a small balance on hand. Progress was reported on the Bengali Commentary on the New Testament, in which Mr. Rouse had taken the place of the Rev. Dr. Wenger, deceased, and on the Dualla (African) version of the New Testament. The *Baptist and Irish Home Mission* had received £4,002; the *Zenana Mission*, £4,635.

The total income of the *Baptist Missionary Society* had been £52,366, and it closed its year with a deficiency of nearly £7,000. The receipts for special purposes (included in the total) had been £6,497. Encouraging progress was reported of the missionary work in India, the West Indies, and Africa. A special steam-launch was in course of construction for the Congo mission in Africa. In China, Mr. Richard had been preparing translations and original books for the *literati* in Shansi.

The annual report of the *Baptist Union of Scotland* for 1880-'81, which was read at the meeting of the Union in April, gave the number of churches in connection as 80, with 8,500 members. Sixty-seven Sunday-schools, with 905 teachers and 7,300 children, and 157 preaching-stations, were also reported. Forty-seven Bible-classes had been formed during the year, and were attended by 1,940 persons. One new chapel had been opened, and three others were being built.

VI. GENERAL BAPTISTS.—The one hundred and thirteenth annual meeting of the *General Baptist Association* was held at Derby in June, under the presidency of the Rev. William Gray, of Birchcliffe. Reports had been received from 168 out of 187 churches, which showed a clear gain of 442 members. The total expenditure for home missions for the year had been £483, and the committee returned a balance on hand of £401. The total receipts for foreign missions had been £8,116, of which sum £3,203 had been received in India, and £185 in Rome. The expenditures had been £8,947. The liabilities of the society had been increased by £279. The Building Fund Committee returned a capital, provided "all promises were fulfilled," of £5,500. Its receipts had been £1,557, and it had made grants to churches of £1,250.

VII. BAPTISTS OF GERMANY.—The twelfth Triennial Convention of the *Baptists of Germany* and other European countries was held in August in Altona. One hundred and thirty-

five delegates were present, representing 140 churches and 2,800 members, all the result of a mission which was begun under American auspices in 1834. The publishing business of the convention was represented as being in a flourishing condition. Six thousand dollars had been raised during the past three years for the theological school. The convention resolved to celebrate the semi-centennial anniversary of the mission in 1884, by establishing a fund for invalid preachers.

BARNARD, JOHN GROSS, born in Sheffield, Mass., May 19, 1815; died at Detroit, Mich., May 16, 1882. General Barnard received a good rudimentary education, and at the age of fourteen was admitted as a cadet in the United States Military Academy at West Point. After graduating he was brevetted second-lieutenant of the Corps of Engineers, and soon was sent to the Gulf coast, where, as assistant and principal engineer, he was engaged on the fortifications of Pensacola and New Orleans. He was also employed on various harbor improvements until the war with Mexico called him to active service. He superintended the construction of the defenses of Tampico, and surveyed the battle-fields about the city of Mexico. For his "meritorious conduct while serving in the enemy's country," he was brevetted major on May 30, 1848. Two years after he was appointed chief of a scientific commission to survey the Isthmus of Tehuantepec, with a view to the construction of a railroad across it. He was next employed in improving the mouths of the Mississippi River. He was superintendent of the United States Military Academy from 1855 to 1856, and then was in charge of the fortifications of New York Harbor.

At the outbreak of the war General Barnard served as chief-engineer of the Department of Washington from April to July, 1861, and then as chief-engineer to General McDowell in the first Bull Run campaign. Next, with the rank of brigadier-general, he acted as chief-engineer to the Army of the Potomac in the Virginia peninsular campaign of 1862. When the Confederate army invaded Eastern Virginia, he was appointed chief-engineer of the defenses of Washington, D. C. In January, 1864, he was appointed chief-engineer, and was on the staff of General Grant in the Richmond campaign. At the end of the war he was made brevet major-general, United States Army, "for gallant and meritorious services in the field," and soon promoted colonel in the Corps of Engineers. The President nominated him, on the death of General Totten, to succeed the latter as brigadier-general and chief of engineers in April, 1864; but, at General Barnard's request, the nomination was withdrawn before the Senate had taken any action on it. He was made a member of the Joint Board of Army and Navy Officers on Harbor Defenses, Torpedoes, etc., and served as senior member of the Board of Engineers for Per-

manent Fortifications, and also as a member of the United States Light-house Board. General Barnard was not only a brave soldier, but an eminent scientist and author. He wrote a number of valuable works, among which are: "Survey of the Isthmus of Tehuantepec," 1852; "Phenomena of the Gyroscope," 1858; "Dangers and Defenses of New York," 1859; "Notes on Sea-coast Defense," 1861; "The Confederate States of America and the Battle of Bull Run," 1862; "Reports of the Engineer and Artillery Operations of the Army of the Potomac," 1863; "Eulogy on General Totten," 1866; and many scientific and military memoirs and reports. The University of Alabama conferred on him the degree of A. M. in 1838, and in 1864 he was made LL. D. of Yale College. He was also a corporator of the National Academy of Sciences.

BEER. According to recent statistics, the total annual production of beer is, in round numbers, 3,675,000,000 gallons. The countries producing the greatest amount of beer are as follows:

COUNTRIES.	Gallons.	Per cent of the total production.
Great Britain .....	1,286,000,000	35.0
Germany .....	997,500,000	27.0
United States .....	898,750,000	11.0
Austro-Hungary .....	815,000,000	8.5
France .....	210,000,000	5.7
Belgium .....	196,900,000	5.0
Russia (in Europe) .....	105,000,000	2.8
Netherlands .....	52,500,000	1.4
Denmark .....	52,500,000	1.4
Sweden .....	39,000,000	1.0

The greatest amount of beer consumed per head of population is in Bavaria and Württemberg; then come England, Belgium, Saxony, Austria, United States. In Austro-Hungary the beer-tax amounted to \$10,000,000 in 1881, and in Germany to \$4,500,000.

A new beer-tax went into operation in Great Britain on October 1, 1880. While the tax was formerly imposed on the amount of the grain used, it is now estimated on the specific gravity of the unfermented beer, called wort, in such a manner that a tax of 6s. 3d. is imposed on every barrel of thirty-six gallons, of a specific gravity of 10.57. Heavier or lighter beers are to be taxed more or less *pro rata*. Besides this tax, every brewer must pay £1 per annum for a license. Brewers are permitted to use any materials they see fit. On beer which is exported the tax is remitted. The brewing for private use is not taxed, provided the annual rent of such private brewer, or its estimated value, does not exceed £15. Beer brewed under this condition can not be sold. The only charge put on a private brewer is an annual license-fee of 6s. The report for the first year of the new tax, from October 1, 1880, to September 30, 1881, showed that there were 17,110 brewers in the United Kingdom, who paid taxes to the amount of £8,498,044, 2s. 5d. It appeared from the re-

port that the large breweries which paid the highest taxes also paid much more in proportion than the smaller establishments. Another interesting fact was that the number of private brewers had increased beyond all expectation, the Chancellor of the Exchequer stating the amount received in fees from this source during the fiscal year, 1881 to 1882, at £46,000.

The total number of breweries on September 30, 1880, and the number doing business during the year 1880-'81, were as follows:

BREWERIES.	Number on Sept. 30, 1880.	Number during 1880-'81.
Breweries producing less than 1,000 barrels	16,770	14,948
“ 1,000 to 10,000 “	1,768	1,677
“ 10,000 “ 20,000 “	272	275
“ 20,000 “ 30,000 “	96	88
“ 30,000 “ 50,000 “	69	68
“ 50,000 “ 100,000 “	38	32
“ 100,000 “ 150,000 “	7	7
“ 150,000 “ 200,000 “	2	2
“ 200,000 “ 250,000 “	2	2
“ 250,000 “ 300,000 “	2	3
“ 300,000 “ 350,000 “	1	..
“ 350,000 “ 400,000 “	..	1
“ 400,000 “ 450,000 “	8	8
“ 450,000 “ 500,000 “	1	1
“ 500,000 “ 600,000 “	1	..
“ 600,000 “ 750,000 “	1	..
“ 750,000 “ 800,000 “	..	1
“ 800,000 “ 850,000 “	..	1
“ 850,000 “ 900,000 “	..	1
“ 900,000 “ 950,000 “	1	..
“ 950,000 “ 1,000,000 “	1	..
“ 1,000,000 “ 1,050,000 “	1	1
Beginners.....	2,183	..
Total .....	21,223	17,110

The general result of the new tax, according to these figures, seems to be a closing of the smaller breweries; for, if the 2,183 beginners of the year 1880 are added to those producing less than 1,000 barrels, a total of 18,953 results, which number was reduced to 14,948 in the first year under the new tax, showing a decrease of 4,005. The total amount of the beer-tax, inclusive of licenses, during the fiscal year ending March 31, 1882, was £8,500,000, while in the last fiscal year, under the old tax, which ended on March 31, 1880, the total beer-tax amounted to £7,727,000, showing a surplus of £853,000.

**BELGIUM.** The census of December 31, 1880, makes the total population of Belgium 5,519,844. The mean density of population is 187 inhabitants per square kilometre. The kingdom is divided into 41 administrative arrondissements and 2,583 communes. The population of the different provinces is as follows:

PROVINCES.	Population.	Per square kilometre.
Antwerp .....	577,282	204
Brabant .....	985,274	300
West Flanders .....	691,764	214
East Flanders .....	881,816	294
Hainault .....	977,562	262
Liège .....	664,606	230
Limburg .....	210,851	87
Luxemburg .....	209,118	47
Namur .....	322,620	83
Total .....	5,519,844	187

The population of Belgium at former censuses was 5,087,826 in 1870, 4,731,957 in 1860, 4,426,202 in 1850, and 4,073,162 in 1840. In 1870 the province of Antwerp had 492,482 inhabitants; Brabant, 879,814; West Flanders, 668,976; East Flanders, 837,726; Hainault, 897,006; Liège, 592,177; Limburg, 200,336; Luxemburg, 205,784; and Namur, 313,525. The population has increased most in the arrondissements of Charleroi (160 per cent), Brussels (91 per cent), Antwerp (89 per cent), Liège (82 per cent), Verviers (63 per cent), and Mons (49 per cent); it remained nearly stationary in those of Bruges, Furnes, Ypres, Courtrai, and Tournai, and diminished in those of Audenarde, Thielt, and Ath.

**AREA.**—The total area of the kingdom is 2,945,516 hectares, about 11,373 square miles. The number of agricultural holdings has increased from 5,720,976 in 1845 to 6,472,845 in 1880. Their average size is a little over an acre.

**OCCUPATIONS.**—The statistics of occupations show that 773,698 persons are employed in agricultural pursuits; 267,940 in the clothing trades, 185,658 in textile manufacture, 139,612 in domestic service, 131,311 in the building trades, 110,139 in food manufactures, and 83,363 in the coal and iron industry. There are 8,146 in the employment of the Government, 18,196 religious, and 50,804 landlords and capitalists. Of the population above the age of seven years, 58 per cent know how to read and write; above the age of thirty-five, the proportion is 49 per cent, and below the age of fourteen it is 72 per cent. In 1866, 32 per cent of the population was married. In 1840 there was one divorce to every 1,175 marriages; in 1865, one to every 739; and in 1880, one to every 182. The excess of births over deaths was 33 per cent in 1840, 28 per cent in 1865, and 39 per cent in 1880. The percentage of illegitimate births was 8 per cent in 1880, an increase of 2 per cent since 1840.

**CHAMBERS.**—The representation in the Chamber of Deputies was increased by six, and in the Senate by three seats, by a law introduced by the Government to give effect to the provisions of the Constitution requiring one deputy to be chosen to every 40,000 inhabitants, and half as many senators as there are deputies. The present numbers are 183 and 69. A new oath has been adopted in criminal procedure which runs as follows: “I swear before God and man to speak without hate or fear, and tell the whole truth and nothing but the truth.” Whoever declares that he has conscientious scruples against swearing can use the formula, “I solemnly promise to speak,” etc.

**POLITICAL QUESTIONS.**—Political activity in Belgium is confined to the protracted conflict over education, and the rights and status of the Roman Catholic clergy in the state. In the elections in June the Liberals gained a slight advantage, increasing their majority in the Lower Chamber from fourteen to sixteen, while

in the Senate they have a majority of seven instead of four. The latest programme of the Clerical party embraces among other points the abolition of the Ministry of Instruction, and the solution of the educational question by the introduction of the English voluntary system. The continual deficit in the public accounts will disappear with the contraction of the state school establishment. The Clericals propose, when they come into power, to extend the electoral franchise, and to secure the self-government of the provinces and the communes which is threatened under the Liberal *régime* of Frère Orban, the present President of the Council. The diplomatic relations with the Papal court would naturally be speedily resumed.

**LEGISLATION.**—Dissension arose among the Liberals over the question of the property qualification for suffrage, which is the payment of forty francs in taxes. The Clericals demanded a reassessment, which would increase the number of rural voters, which was accorded. A portion of the Liberal party proposed instead the amendment of the Constitution and the substitution of an educational test.

An extradition treaty has been concluded with the United States, in which for the first time in such an instrument the attempted assassination of a ruler is made an extraditable offense.

Saintelette, the Minister of Public Works, who retired in July, on account of his health, introduced the practice of employing women in the railroad, postal, and telegraph services. The innovation found many indignant opponents, but his successor, Olin, is determined to make it successful.

**FINANCES.**—The Chambers have authorized various loans, amounting in all to 209,015,124 francs, at three per cent interest. Rothschilds and Belgian banking-houses took 133,000,000 francs at 82 per cent of the par value. The budget for 1883 places the revenues at 300,153,390 francs, 3,505,681 francs more than the expenditures authorized for 1882; and the expenditures at 312,566,885 francs—that is, 12,413,495 francs more than the revenues. Among the items are 104,433,556 francs for public works, 88,805,919 francs for interest on the public debt, 44,727,300 francs for army and navy, 20,474,734 francs for public instruction, 16,051,411 francs for the administration of justice, 15,649,980 francs for the department of finances, 10,090,580 francs for internal administration, 3,496,900 francs for the gendarmery, and 2,335,830 francs for the foreign department.

BLANC, JEAN JOSEPH LOUIS, French statesman, historian, and socialistic theorist, died December 6th, at Cannes. He was born at Madrid, October 28, 1813. His father was financial overseer under King Joseph, his mother a Spanish lady of earnest temperament, belonging to the family of Pozzo di Borgo, whose

hostility to Napoleon she shared. The family were ruined in fortune by the Revolution of 1830. Louis was recalled from his studies to Paris and became a clerk in a lawyer's office. In 1832 he became tutor in a family residing in Arras. Returning to the capital in 1834, he entered upon a journalistic career, contributing to journals of radical tendencies, like "Le Bon Sens," the "Revue Républicaine," which was suppressed in 1835 by Thiers, and the "Nouvelle Minerve." He was editor of the first periodical from 1836 to 1838, and left it because the proprietors objected to his writing in favor of the nationalization of the railroads. He established "La Revue du Progrès," in which he advocated socialistic ideas, and proposed the organization of a league of democratic associations. He was waylaid by masked men, who beat him and left him for dead, shortly after the appearance of an article in praise of Bonapartist liberalism. It was popularly believed that the police were concerned in the outrage. The notion that he was a martyr for his opinions greatly extended the influence of Louis Blanc, whose admirable style and originality of thought had already won him many readers. After his recovery he wrote his essays on "The Organization of Labor." In these not only the doctrines of French communism were unfolded in a more convincing and captivating form than previously, but a practical scheme for their accomplishment was presented which has remained to this day the goal of French socialism. They were issued in book form in 1841, in which year was published also the "History of Ten Years," a work which greatly added to his literary reputation and raised him to the position of a popular leader of the revolutionary movement against the monarchy of July. This political tract, which summed up the sins of the reign of Louis Philippe and the hopes of the French democracy, helped to precipitate the Revolution of 1848. When the revolution came, Louis Blanc, who was looked upon by the working-men as their prophet, was made a member of the Provisional Government. He secured the adoption of a law abolishing the death-penalty for political offenses, but when he enunciated some of his revolutionary projects they were received so coldly that he resigned, but resumed his position in the Provisional Government when the opportunity of carrying out the experiment of the organization of labor was offered him as a bait to the masses who were ripe for a social revolution. He called together the Labor Commission, of which he was appointed president, in the Luxembourg Palace, and invited before it masters and laborers. When the working-men of Paris saw the delusive character of the revolution, they called upon Louis Blanc to assume the dictatorship. By declining, he lost his power over them. He was elected a member of the National Assembly. He brought forward the law repealing the sentence of exile against the Bonaparte family. After the Po-

land demonstration he was accused of plotting it, and after the June insurrection the charge was revived, and the Assembly voted to proscribe him. He fled to England, where he lived in exile until 1870. He corresponded with French newspapers, and continued his "History of the French Revolution," the first volumes of which had appeared before the February Revolution, during his long banishment. In 1865 he married Christina Groh, an accomplished Englishwoman. His "Letters on England" were collected and published. He wrote "Historical Revelations" to correct Lord Normanby's account of the Revolution of 1848. After his return to France, Louis Blanc was no longer the extremist who proposed to reform society in 1848. He was elected a member of the National Assembly in February, 1871. The socialists looked to him for a leader, but when he became a follower of Thiers his political influence was gone, but not the reverence with which the radicals regarded their teacher.

Louis Blanc was an unimpressive orator, being a small man of juvenile appearance and a thin voice. In conversation he was entertaining, and mild and agreeable in manners. It is reported that when his attempted assassination occurred, on August 15, 1839, his younger brother, who became distinguished as an art critic (see OBITUARIES), had a vivid presentiment of the scene, an incident on which Dumas founded the play of "The Corsican Brothers."

**BORNEO, NORTH.** Borneo, the largest island in the world after Australia, is one of the Malay Archipelago, and lies under the equator, with the 114th meridian of eastern longitude passing through its center. The northeast corner of the island, a tract about 18,000 square miles in area, with a coast-line of about 500 miles, and containing two natural harbors equal to any in the world, has been brought practically under the dominion of the British crown by the intermediation of a commercial company called the British North Borneo Company.

Spain has long laid claim to the sovereignty of this portion of Borneo, together with the islands of the Sooloo Archipelago. In 1836 the Sultan of Sooloo made his submission to the Spanish crown by a treaty. By another act, signed in 1851, he acknowledged all his territories to be integral parts of the Spanish dominions. In 1849 Sir James Brooke attempted to conclude a treaty with the Sultan, but in deference to the Spanish protests it was never ratified. In 1870 the Sultan of Sooloo rebelled, and a desultory war was carried on until 1877, during which Spain declared a blockade and stopped some German and British vessels. A diplomatic dispute ensued, which ended in the signature of a protocol waiving the right to obstruct commerce. The mooted question of sovereignty was purposely left unmentioned. In 1878 Spain reduced the rebellious vassal,

and exacted a new declaration of allegiance, recognizing her sovereignty over the Sooloo Archipelago and its dependencies. This time the British Government saw fit to enter a protest against the Spanish protectorate.

In the mean time, while the Sultan of Sooloo was in rebellion against his sovereign, Baron Overbeck, an Austrian, with financial means provided by Alfred Dent, a tea-merchant of Shanghai, had obtained from this potentate and the Sultan of Brunei a formal cession of sovereign and proprietary rights over all North Borneo. The agent of the adventurous British merchant had first bought out an American company which held a commercial concession from the Sultan of Brunei. He then acquired from the latter all his rights in the territory for the sum of \$5,000. The ruler *de facto*, and, in virtue of grants from the Sultan of Brunei, *de jure*, was the Sultan of Sooloo. Overbeck went to him and received, six months before he capitulated to the Spaniards, the cession of all his domains in Borneo, in consideration of an annual payment of a few thousand dollars. The bestowal of exclusive privileges would be in violation of treaty rights secured to citizens of the United States. Accordingly, the Sultan of Brunei was called to account by the American Government, and replied that Dent and Overbeck's cession was subject to the treaty stipulations.

Dent applied to the British Government for a charter of incorporation in 1878. Lord Salisbury, in objecting to the assertion of sovereign rights in North Borneo by Spain, disclaimed any intention to establish British rule in Borneo. The Government of the Netherlands protested against the adoption of the acts of the company by the British Government, because a good portion of the territory lay within the boundaries of the Dutch dominions, and because a treaty, made in 1824, precluded England from assuming sovereign powers in these regions.

The charter was granted by the succeeding Government in November, 1881. By the terms of the charter the company can not transfer the benefits of their grants without the sanction of the British Government. They are bound to discourage and, if practicable, abolish by degrees the institution of slavery. The appointment of the chief officer of the company in the island is made subject to the approval of the crown authorities. The cultivation and sale of opium are subjected to certain limitations.

The authority transferred by the two Sultans to Dent and his associate, and vested by them in the joint-stock company, is of the most absolute and unlimited character. They were constituted the rulers of these wide domains, and proprietors of the soil, with the power of life and death over the 150,000 inhabitants, the rights to coin money, to levy an army, and to impose taxes and customs. They possess these sovereign rights under the titles of Maharajah of Sabah, or North Borneo, Rajah of Gaya

and Sandakan, and Datu Bandahara. The treaty gives them authority to acquire, by purchase or other means, other lands besides those ceded.

The company took formal possession of the territory soon after receiving the grants in 1877. A deputy of each of the Sultans accompanied the representative of the association on a voyage around the coast. In each of the six places at which they landed the chiefs and people were called together to listen to a proclamation announcing the grant, and enjoining them to obey the new authorities. The company established factories at several points on the coast. The results of the new rule were salutary. Trade and production were stimulated, and piracy decreased rapidly.

**BRAZIL (IMPERIO DO BRAZIL).** (For details relating to area, territorial divisions, population, etc., reference may be made to the "Annual Cyclopædia" for 1878.)

The Emperor is Dom Pedro II, born December 2, 1825; proclaimed April 7, 1831; regency until July 23, 1840; crowned July 18, 1841; married September 4, 1843, to Theresa Christina Maria, daughter of the late King Francis I of the Two Sicilies.

The Cabinet in 1882 was composed of the following Ministers: President of the Council and Minister of Finance, Councilor A. S. C. Martinho; Interior, Councilor R. E. S. Dantas; Justice, Councilor M. S. Mafra; Foreign Affairs, Councilor F. F. De Sa; Navy, Councilor A. C. De Rocha; War, Councilor A. A. M. Penna; Public Works, Commerce, and Agriculture, Councilor M. A. De Aranjó.

The Council of State was composed of the following members in ordinary: The Princess Imperial, Donna Isabel; Prince Gaston d'Orléans, Count d'Eu; the Senators Viscount de Aboeté, Viscount de Muritiba, Viscount de Bom Retiro; Viscount de Jaguarý; Viscount de Nietheroy, Viscount J. J. Teixeira, Vice-Admiral J. R. de Lamare, and Dr. P. J. de Soares de Souza; and of members extraordinary: Senator Viscount de Paranaguá, Senator M. P. S. Dantas, Councilor Martin Francisco, Viscount de Prados, and Councilor J. C. de Andrade.

The President of the Senate, which comprises 58 members elected for life, was Baron de Cotegipe, and the Vice-President, Count de Baependy. The President of the Chamber of Deputies, with 122 members elected for four years, was Councilor J. F. de Moura; and the Vice-President, J. L. Lima Duarte.

The Presidents of the several provinces were as follow:

Alagóas, Dr. J. R. Torres; Amazonas, Dr. J. L. da Cunha Paranaguá; Bahia, Councilor Pedro Luiz P. da Souza; Ceará, Dr. S. B. Pimentel; Espírito Santo, Dr. H. M. Inglez de Sousa; Goyaz, Dr. C. P. de Magalhães; Maranhão, Dr. J. M. de Freitas; Matto-Grosso, Colonel J. M. de Alencastro; Minas-Geraes, Th. Oltoni; Pará, Dr. J. R. Chaves; Parahyba,

Dr. M. Ventura B.; Paraná, Dr. C. A. de Carvalho; Pernambuco, Councilor J. L. Barrojo; Piahy, Dr. M. J. A. Castro; Rio Grande do Norte, Dr. F. G. C. Barreto; Rio de Janeiro, Dr. B. A. Gavião P.; Santa Catharina, Dr. E. F. L. Santos; São Paulo, Councilor F. C. S. Brandão; São Pedro do Sul, Dr. J. L. Godoy V.; Sergipe, Dr. J. A. do Nascimento.

The Archbishop of Bahia, the Right Rev. L. A. dos Santos (1880), is Primate of all Brazil; and there are eleven bishops: those of Pará, São Luiz, Fortaleza, Olinda, Rio de Janeiro, São Paulo, Porto Alegre, Marianna, Diamantina, Goyaz, and Cuyabá.

**ARMY.**—Pursuant to the law of February 27, 1875, military service is obligatory for Brazilian subjects, while admitting numerous exemptions and substitutions. The period of service in the regular army is six years, and in the reserve three years. The strength in time of peace is 13,000; the army counted, in 1882, 1,743 officers and 11,368 men; the regulation war strength was to be fixed at 32,000.

**NAVY.**—The navy, in 1882, consisted of ten iron- and steel-clads, one steam-frigate, seven steam-corvettes, sixteen steam-gunboats, and five steam-transports, one sailing-corvette, and two sail-avisos, together forty-two vessels; manned by 3,567 men, carrying altogether 166 guns, and having a joint horse-power of 8,660; building, two iron- and steel-clads and one gunboat. The *personnel* of the navy was composed of 15 superior officers, 412 officers of the first class, 73 men forming the sanitary corps, 92 pursers, 50 guardians, and 184 machinists. Imperial Marine Corps, 2,698 men; Naval Battalion, 214 men; apprentices, 997; total, 4,735 men.

**FINANCES.**—The actual revenue of the empire during the fiscal year 1878-'79, according to the accounts rendered in 1882, has been 116,460,981 milreis, while the expenditure proves to have been 181,468,557.

The budget estimate for 1882-'83 is set forth as follows:

INCOME		Milreis.
Ordinary and extraordinary revenue	128,288,000	
Emancipation fund	1,200,000	
Deposits	8,000,000	
Total	127,488,000	
OUTLAY.		Milreis.
Ministry of the Interior	9,332,418	
Justice	6,767,000	
Foreign Affairs	919,906	
War	14,436,076	
Navy	10,695,296	
Agriculture and Commerce	23,283,506	
Finance	61,944,916	
Total	127,284,118	

The expenditure authorized to be made during the fiscal year 1883-'84 runs up 129,823,825 milreis, and differs little in the various items from those above given. In the mean time the Government has placed on the London market a  $4\frac{1}{2}$  per cent loan for £4,000,000, through the Messrs. Rothschild, which was placed at 89.

The national debt stood, on March 31, 1882, as follows:

Five per cent foreign indebtedness, payable in gold .....	Milreis. 141,072,000
Internal debt, payable in paper money, and bearing 4 to 6 per cent interest .....	408,782,000
Floating debt:	Milreis.
Contracted prior to 1837 .....	143,022
Orphan funds and deposits .....	51,622,116
Treasury bonds .....	28,894,700
Paper money issued by the state .....	188,110,978—268,770,511
Total .....	818,574,811

The assets of the Government, March 31, 1882, were: Uncollected taxes, 13,407,483; due to the state by railroads, 13,211,019; due to the state by the Argentine Republic, 15,796,301; and by Paraguay, 227,883 milreis.

About the above national debt the "Diario Official," of Rio, remarks, under date of December 9, 1882: "Four hundred and seven million milreis of the above indebtedness arose from the Paraguayan War; 60,400,000 from state aid extended to our northern provinces during a series of years when the drought afflicted them; and 130,885,000 milreis were spent on railroads and other public improvements."

Since the law of September 28, 1871, the amount of money disbursed under its provisions from the Emancipation Fund has been 12,096,000 milreis, 8,683,859 of which since March 25, 1875. Further payments are to be made without delay, and thus the total available fund of 24,000,000 milreis will soon be disbursed. This is calculated to allay the agitation about the slavery question which has existed in Brazil in 1882.

The Rio correspondent of the "Indépendance" (Brussels) remarks: "Slavery has received a death-blow; everybody tries to get rid of this shameful heritage of the past as fast as possible, so that hardly a day passes but one hears of numerous liberations of slaves. It is, however, necessary, at almost any cost, to procure other hands to replace the emancipated. There is some European immigration, but it does not amount to much, though latterly rather in the ascendant. Hence, it is intended to introduce Chinese coolies, not as a permanent source of immigration, but as an element of transition that is to bridge over the gap between the black field-laborer and the free European tiller of the soil. With this object before them, the coffee-planters of Rio de Janeiro and São Paulo have accepted the proposal made them by the 'China Merchants' Steam Navigation Company' of importing for them twenty-one thousand Chinese coolies within the ensuing three years. It will then be seen whether this importation will answer."

M. Ad. de Fontpertuis, in his work just published in Paris, "Les Nations latines de l'Amérique," remarks about Brazil that it may be divided into three great zones: that of the forests—distinguished by the production of cocoa, India-rubber, sarsaparilla, vanilla, a great variety of gums, nuts, and textile plants, many of the latter three yet unknown in manufacturing countries—that of coffee, and that of cereals.

The foreign-trade movement in Brazil, including the precious metals, is officially given to have been during the ensuing two fiscal years:

	Imports.	Exports.
	Milreis.	Milreis.
1878-'79 .....	162,332,400	206,453,000
1879-'80 .....	173,612,300	222,351,700

The value of exports in contos de reis of 1,000 milreis was distributed as follows among the chief articles:

ARTICLES.	1878-'79.	1879-'80.
Coffee .....	184,029	126,260
Cotton .....	4,614	6,187
Sugar .....	23,374	81,334
Paraguay tea (Herva-Mate) .....	8,289	2,522
Hides .....	8,855	8,950
Tobacco .....	8,069	7,661
India-rubber .....	11,366	12,243
Diamonds .....	1,381	1,007

#### COFFEE EXPORTATION FROM RIO.

Belgium.....	20,136	23,079	2,893
Total.....	224,433	358,811	134,328

Total increase, 60 per cent.

Since slavery was abolished in the southern States of the Union, the consumption of Rio coffee, in particular, has increased more rapidly than ever in the United States, as the negroes prefer this strong coffee to any other.

Next to Rio, the export movement in Brazil-

ian produce has expanded most rapidly at Pará, the port of the Amazon River.

1874 .....	531,379	1881 .....	677,702
1875 .....	599,382		

An article produced in the province of Paraná, of great importance in its traffic with Montevideo, Buenos Ayres, and Valparaiso, is Paraguay tea (*Herva-Matte*), of which that province exported:

DESTINATION.	1881.	1882.
To Montevideo .....	Tons. 3,254	3,873
To Buenos Ayres .....	7,510	7,729
To Valparaiso .....	1,960	3,787
Total .....	12,724	15,389

So-called “central sugar-factories” (*usines centrales*) are rapidly being introduced throughout the sugar regions of Brazil, and promise to do as good service as they do in Cuba and the French West Indies and other cane-sugar producing countries. One such factory, in the province of São Paulo, we shall give some details about by way of example. This factory, the Companhia Assuacreira de Porto Feliz, began operations on October 28, 1878, and declared a dividend for 1882 of 11½ per cent. It produced last year (1882):

	Milreis.
5,729 bags of sugar, first quality .....	111,121
1,974 “ second quality .....	33,600
1,883 “ third quality .....	20,102
88 “ fourth quality .....	1,320
750 casks of rum .....	12,775
Total .....	178,918

	Milreis.
Brought forward .....	178,918
Sugar-house expenses, including cartage and ordinary labor .....	29,409
Salaries to experienced operatives (engineer, etc.) .....	12,130
Canes purchased .....	92,756
	184,345
Net proceeds of 1882's operations .....	44,573

The “Diário Oficial,” of Rio de Janeiro, of March 15, 1883, contains some interesting notes relative to the development of cotton manufacture in the South American empire, which may prove of value to the manufacturers of cotton machinery in this country. Nowhere, it seems, can cotton be grown so advantageously as in Brazil. Even at the present low price the Brazilian cotton planters in some districts clear an annual net profit on their cotton of twenty per cent. Seventeen years ago cotton manufacture was still in its infancy in Brazil, for there were then but nine mills, with 768 operatives employed therein, 14,875 spindles, and 385 mechanical looms. Total horse-power (steam) at the time, 36; water-power, ditto, 288; yards of tissue turned out, 3,944,600; twist made, 126 tons. Value of total production in 1866, 1,166,200 milreis. At present there are 45 cotton-mills. In the province of Rio de Janeiro there is the Santo Aleixo, founded in 1849; has 7,000 spindles, 160 looms, 130 operatives; makes 1,800,000 yards tissues, and 14 tons twist; produces 400,000 milreis annually. Power, 50 horse, water.

Brazil Industrial, 20,000 spindles, 450 looms, 560 horse-power, water; 400 operatives; products, 3,800,000 yards.

São Pedro de Alcantara, at Petropolis, in 1874, with a capital of 150,000 milreis, 50 horse-power, water. Consumed the past seven years altogether 30,479 bales of cotton; 130 operatives. Has dyeing department, dyeing 200 arrobes of twist per day. Production, 1,200,000 yards.

Fabrica Petropolitana, also near Petropolis; founded in 1874, with a cash capital of 540,000 milreis; 120 horse-power, water; 5,600 spindles and 108 mechanical looms; 200 operatives, drawing salary as to age, \$1 to \$9. Consumes 500 tons Pernambuco cotton. Turns out 1,500,000 yards annually.

The greatest amount of raw cotton exported in any one year from Brazil was reached in 1872, when 78,517 tons were shipped, amounting to 46,445,928 milreis. Now Brazil consumes a great portion of its crop.

**BULGARIA**, a principality of Eastern Europe created by the Treaty of Berlin, signed July 13, 1878, out of a portion of the Christian provinces of Turkey which by rising in rebellion provoked the intercession of Russia and the Turkish War. It lies between Roumania on the north and the autonomous Turkish province of Eastern Roumelia, with Servia on the west, and the Black Sea as its eastern boundary. The estimated area is 24,360 square miles; the population, according to a census taken January 1, 1881, is 1,995,701. It was redivided in August, by a decree of the Council of State, into fourteen instead of fifty-six administrative circuits: Sophia, Tirnova, Shumla, Varna, Vracan, Kustendje, Russen, Rasgrad, Lom, Silistria, Widin, Sevlje, Sistova, and Plevna. The inhabitants are industrious agriculturists. They are adherents of the Greek Church, and speak the Servian tongue. The reigning sovereign is Prince Alexander Battenberg, a grand-nephew of the Emperor of Germany and cousin-german of the Emperor of Russia, who assumed the government, June 28, 1879. The principality pays an annual tribute to Turkey. Since its deliverance it has been administered virtually as a Russian dependency.

**SUSPENSION OF THE CONSTITUTION.**—The attachment of the people to Russia has waned since their independence. Panslavism, as taught to them by its Russian apostles, signified the revival of ancient Slavic freedom as well as the union of Slavic peoples under one government. The Bulgarians received from the Panslavic founders of the principality a constitution on the Western model, which, if not Slavic, was very liberal. The activity of parties, the rivalries of politicians, the spread of the extreme theories of Slavic equality forbidden as Nihilism in Russia, and the agitation for the Great Bulgaria of the Treaty of San Stefano, to be formed by union with Eastern Roumelia, which would be as inopportune to the Russian Government now struggling for the autocratic principle as distasteful to Austria, led Prince Battenberg, with the sanction of his Russian protector, to abolish the Constitution by a *coup d'état* (see "Annual Cyclopaedia" for 1881). A Grand National Assembly, convened for the purpose, invested him with autocratic powers for seven years by a vote taken July 13, 1881.

**EVENTS OF THE YEAR.**—The Conservatives, who had supported the Prince, and the Moderates as well as the Radicals, whose ministry he had dismissed, were scandalized at the methods by which he and the Russian military officers had manipulated the elections. The Conservative party were alienated by the appointment of foreigners and men outside of politics in the new Cabinet. A revolutionary agitation was raised, but the people and their intellectual leaders in Bulgaria and Eastern Roumelia were disposed to wait and see if the Prince would introduce the promised economy and reform in the administration, and govern

better than the politicians, who had pleased the people at large scarcely better than they had the Prince. When months went by without any developments besides the suppression of newspapers, the imprisonment of statesmen, and the rigorous supervision of the school-teachers, popular dissatisfaction revived and took the form of an organized agitation for the restoration of constitutional government, in which both the political parties joined. Deputations and petitions poured in from all parts of the country, until the Prince refused to receive any more, on the pretext that he had been deceived by fraudulent deputations. The Bulgarians, who are simple in their habits and fond of money, were particularly distrustful because there was a heavy deficit instead of a large surplus under the new administration, and because the Prince showed a tendency to lavish expenditure by commencing a \$500,000 palace and assuming airs of royalty. The new officials offended the people by their arrogance and formalism. The taxes, instead of being reduced, were increased by a land-tax, levied in addition to the tithes. The Prince in his perplexities leaned more and more upon the Russian Government. The first ministry, which was suspected of Austrian sympathies, was replaced by creatures of the Russian court. The exploitation of the country by Russian commercial speculators became one of the causes of popular dissatisfaction. The Prince had great difficulty in getting together the Council of State with which he proposed to reform the Government. Before it began to work the country had reached the verge of revolution, and talked of deposing the reforming Prince. In May he visited St. Petersburg to take counsel with his imperial patron. Martial law was proclaimed throughout the country. The agitation was fostered by the intriguing agent-general of the Russian Government, Hitrovo, who the year before had managed the *coup d'état*. This Russian, De Blignières, was finally recalled. Under the directions of the Russian Foreign Office, Prince Battenberg issued orders for the election of a new National Assembly, not, however, with constitutional powers, but without control over the ministry, and even without freedom of debate. The Council of State, which was formed after searching six months for suitable and willing members, had passed several measures, chief of which were the repartition of the country into administrative districts, and the commutation of the tithes into a land-tax. The elections to the fictitious National Assembly took place in the autumn. The militia controlled the balloting, as they did in the *plébiscite* of the previous year. Care was taken that none of the active opponents of the Prince should appear upon the scene, although an entirely subservient Assembly could not be collected, since discontent is universal. Zancoff, one of the Liberal leaders, was cast into prison.

**POLITICAL SITUATION.**—The Prince, who is

a German in education and character, and a scion of the Hohenzollern family, formerly exhibited German tendencies, but he has become the submissive vassal of the Czar. When invited to the throne he was wittily advised by Prince Bismarck to accept, because his reign would be a "pleasant reminiscence." His not ill-intended attempt to govern the independ-

ent Bulgarians as he would a German regiment has brought him into a position where the bayonets of the militia, officered by Russians, are all that prevent his people from driving him out of the country, and where a word from the Russian Foreign Office, which may be spoken at any time, would deprive him of his crown.

## C

**CALIFORNIA.** The State officers during the year were as follows: Governor, George C. Perkins (Republican); Lieutenant-Governor, John Mansfield; Secretary of State, Daniel M. Burns; Treasurer, John Weil; Comptroller, D. M. Kenfield; Superintendent of Public Instruction, F. M. Campbell; Attorney-General, Augustus L. Hart; Surveyor-General, J. W. Shanklin; State Librarian, R. O. Cravens. The Supreme Court was constituted as follows: Chief-Justice, Robert F. Morrison; Associate Justices, M. H. Myrick, G. W. McKinstry, G. W. Ross, J. D. Thornton, J. R. Sharpstein, and S. B. McKee.

**STATISTICS.**—The State tax levy, as fixed by the State Board of Equalization for 1882, is based upon a property valuation of \$582,158,981, or \$51,420,696 less than that of 1881, which was \$633,579,677. For 1882 the tax rate was 59.6 cents on each \$100 of assessed valuation. This was divided for the funds as follows: For the general fund, 27.8 cents; for the schools, 24.3 cents; and for the interest and sinking fund, 7.5 cents. The tax levy for 1881 was 65.5 cents.

According to the report of the State Comptroller, dated February 18th, the securities held in trust for the school fund by the State Treasurer consisted of bonds of the State of California, amounting to \$1,737,500, together with bonds of different counties of the State, aggregating \$251,900.

The money in the State Treasury belonging to the State school fund, subject to apportionment, was \$1,483,413, as follows:

Balance unapportioned August 18, 1881 .....	\$60 96
Amount received from the following sources since last apportionment:	
From property-tax .....	1,215,408 05
From poll-tax .....	157,311 45
From interest on State school-lands .....	42,590 71
From interest on bonds held in trust .....	63,102 58
<b>Total .....</b>	<b>\$1,483,474 00</b>
Less amount refunded to San Joaquin County for an overpayment of interest .....	61 00
<b>Total amount subject to apportionment....</b>	<b>\$1,483,413 00</b>

This was apportioned among the counties according to the number of children therein between the ages of five and seventeen years, which for the whole State was 211,237. The California wheat-crop of 1882 has been estimated at 29,590,500 centals, as against 34,150,000 centals for 1880 and 19,801,000 centals in

1879. The surplus for export will be about 1,111,315 tons, which will require over 550 ships of 2,000 tons each to carry away. This, at \$35 per ton, would amount to nearly \$39,000,000.

A comparison of the statistics at hand for the last five years—1877 to 1881, inclusive—shows the following values of the agricultural and mining products and exports of California for that period:

Wheat—value of exports .....	\$90,806,356
Flour—value of exports .....	14,178,898
Barley—value of exports by sea .....	2,126,582
<b>Total for five years .....</b>	<b>\$107,111,836</b>
Precious metals—product .....	\$91,582,995
Quicksilver—value of product .....	10,957,632
Coal—value of product .....	4,464,662
<b>Total for five years .....</b>	<b>\$107,055,289</b>

In the above statement the values of the wheat, flour, and barley consumed in the State are not noted, as there are no accurate data by which to estimate them. The wheat and barley used for seed purposes form, of course, no element in such a comparison.

The merchandise and produce exports from San Francisco by sea during the twelve months ending December 31, 1881, were as follows:

	1881.
Great Britain .....	\$28,719,868
New York .....	5,434,123
Hawaiian Islands .....	2,686,995
Mexico .....	2,515,302
Belgium .....	2,414,420
Germany .....	90,774
Australia .....	816,646
New Zealand .....	153,930
New Bedford .....	100,690
France .....	1,977,091
Central America .....	739,705
Cape Town .....	127,414
British Columbia .....	1,180,643
China and Hong-Kong .....	5,229,234
Japan .....	483,060
Panama .....	198,089
South America .....	96,749
Cape de Verd Islands .....	84,799
Society Islands .....	877,791
East Indies .....	19,804
Islands in the Pacific .....	46,684
Russian Asia .....	120,445
<b>Total .....</b>	<b>\$58,546,196</b>

The total value for 1880 was \$34,686,759, for 1879 the value was \$36,941,668, and \$33,993,551 for 1878.

The number of through passengers by the Central and Southern Pacific Railroads was as

follows in the first eleven months of the given years:

YEARS.	Arrived.	Departed.	Gain.
1881.....	42,818	28,889	13,929
1880.....	81,915	28,455	8,460
1879.....	33,958	22,257	10,696

The arrivals and departures by rail and sea in the given eleven months are shown in the next column:

YEARS.	Arrived.	Departed.	Gain.
1881—By rail.....	42,818	28,889	13,929
By sea.....	25,818	12,114	13,704
Totals.....	68,636	41,003	27,633
1880.....	44,470	39,943	4,527
1879.....	45,871	36,255	9,616

The population of the State by counties and race, according to the census of 1880, is given in the following table:

COUNTIES.	POPULATION.			COUNTIES.	POPULATION.		
	Aggregate.	White.	Chinese.		Aggregate.	White.	Chinese.
Alameda.....	62,976	57,785	4,402	Plumas.....	6,180	4,761	872
Alpine.....	539	521	17	Sacramento.....	84,390	28,923	4,893
Amador.....	11,884	9,924	1,115	San Benito <sup>6</sup> .....	5,584	5,255	242

The State.....					864,694	767,181	75,218 <sup>10</sup>

<sup>1</sup> In 1874, part from Klamath.

<sup>2</sup> In 1872, part to Napa.

<sup>3</sup> In 1874, from part of Siskiyou.

<sup>4</sup> In 1874, part to San Benito.

<sup>5</sup> In 1872, part from Lako.

<sup>6</sup> In 1874, from part of Monterey.

<sup>7</sup> In 1871, part to Ventura.

<sup>8</sup> In 1874, part to Modoc, and part from Klamath.

<sup>9</sup> In 1871, from part of Santa Barbara; in 1873, organized.

<sup>10</sup> Including 86 Japanese.

Included in the aggregate are 6,018 colored persons and 16,277 Indians; 518,196 were males and 346,518 females, 571,820 natives and 292,874 of foreign birth.

The number of persons ten years of age and upward, unable to read, was 48,583, or 7.1 per cent; unable to write, 53,430, or 7.8 per cent, of whom 7,660 were native whites and 27,340 colored (including Chinese and Indians).

There were living in the United States 355,157 natives of California. There were 262,533 white males twenty-one years of age and over in the State (135,209 of native and 127,374 of foreign birth), and 66,809 colored, including Chinese and Indians.

On farms there were 237,710 horses, 28,343 mules and asses, 210,078 milch-cows, 2,288 working-oxen, 451,941 other cattle, 4,152,349 sheep, and 603,550 swine. The number of manufacturing establishments was 5,885; capital, \$61,243,784; hands employed, 43,799; value of materials used, \$72,607,709; of products, \$116,227,973.

The yield of barley, according to the census, was 12,579,561 bushels (more than any other State, and more than a quarter of the entire

product of the country); of corn, 1,993,325; of oats, 1,341,271; of wheat, 29,017,707.

**THE DÉBRIS QUESTION.**—Great interest was felt throughout the State in the case of the People of the State of California against the Gold Run Ditch and Mining Company, which for fifty-eight days was on trial before Judge Jackson Temple in the Superior Court, Sacramento County. The defendant is a corporation organized for the purpose of mining by the hydraulic process and selling water to miners and others, and possessing certain mines and mineral land adjacent to the North Fork of the American River, near the town of Gold Run, Placer County. A decision was rendered in June, and the following extract from the opinion of the judge explains the nature and object of the action:

This action is brought to restrain the defendant from dumping its tailings into the North Fork of the American River. It is charged that these tailings being washed down by the current, are deposited in and fill up the channel of the American River below Alder Creek, as well as the Sacramento, impairing the navigation, increasing the liability of both to overflow, and making each overflow more destructive, causing deposits upon the farming lands, thereby rendering

them unproductive, raising the soil-water, which also tends to unproductiveness, and producing malarial and other diseases among the inhabitants of the valley. It is substantially found that much of the tailings come down the streams, filling up the rivers, and producing most of the evils charged. Navigation has been obstructed, much valuable land covered with sand, and that the continuation of the practice will probably be productive of still greater damage.

The finding may be considered for the defendant, however, upon the charge that the *débris* adds materially to the malarial influences, or has obstructed or will obstruct the sewers of Sacramento, or have injuriously affected the sanitary condition of that city. It is found that mining pollutes the water of the rivers with mud, rendering them less suitable for domestic purposes. And that numerous other persons engaged in the same pursuit contribute *débris* to the same streams, but for which contributions the rivers would be able to maintain their channels without serious obstruction, notwithstanding the detritus from the mine of defendant.

#### The judge adds:

I have concluded to so find that when the heavier *débris* is completely impounded mining may be resumed, virtually refusing to hold that the plaintiff may enjoin such operations as only corrupt the water with mud and render it less suitable for domestic and other uses. Perhaps I am somewhat moved to this by the consideration that otherwise mining can never be prosecuted at all. It will probably be impracticable to impound the lighter portion of the sediment. I confess I shrink from a consequence so far-reaching. It seems to be a conceded fact that this is not materially injurious either to navigation or the riparian lands. Counsel denied that there was any intention to assail the prosecution of drift, seam, or quartz mining. There was no material injury from that source. The sediment from such mines is of the same character as the material which can not be wholly impounded. Perhaps this will not materially add to the permitted evil.

Among the facts found by Judge Temple are the following:

The Sacramento is navigable, and has been continuously navigated by steamers, barges, schooners, and smaller craft, and up to 1862 was navigated as far as the city of Sacramento without difficulty by steamers of deep draught, to wit, by boats drawing nine or ten feet of water. That said river has been declared navigable by law to the mouth of Middle Creek, which is above the confluence of the American and the Sacramento. That since 1862 the navigation of said river has been seriously impaired by deposits of mud and sand therein, which have in part come from hydraulic mines; so that now the city of Sacramento can be reached by boats of deep draught during the high stages of the water only, instead of at all times as formerly.

That hydraulic mining, as that term is generally understood, consists in washing and removing from their natural positions into the water-courses and rivers, by means of water, high banks of earth and gravel containing gold, and thereby separating the gold from the earth, sending the residue, consisting of boulders, cobble-stones, gravel, sand, and clay, into the water-courses, the larger portion of which finds its way into the principal confluent of the Sacramento River, and is deposited along said

streams from the place of discharge or dump to San Pablo and San Francisco Bays, the heavier material being first deposited.

That hydraulic mining has been practiced for twenty years to some extent in the mountains of the Sacramento Basin. It attained great magnitude as an industry before 1875, and is still extensively carried on, principally in the counties of Butte, Yuba, Sierra, Nevada, and Placer.

That the *débris* from mines, including the mine of the defendant, has materially contributed to such filling of the river-channel, and thereby has interfered with and obstructed the free and comfortable use and enjoyment of large portions of the land upon the American and Sacramento Rivers.

That the beds of said rivers have already become so widened and filled that the depth of the water therein has been greatly lessened; that said water, at all times, is heavily laden with earthy matters, chiefly from mines; therefore, said rivers are likely to fill more rapidly in the future in proportion to the quantity of hydraulic tailings than in the past.

That thousands of acres of good land in the Sacramento Valley have already been covered by such *débris*, and if some preventive is not applied, much further and greater injury is likely to ensue in the future, and large tracts of land will probably be rendered within a few years unfit for cultivation and inhabitation.

That if the said acts of the defendant and others, mining as aforesaid, are allowed to continue, there is imminent danger that the beds and channels of the lower portion of the American River, and of the Sacramento River below the mouth of the American, will be so filled and choked up by tailings and other deposits that said rivers will be turned from their channels, cutting new water-ways, injuring or destroying immense tracts of land, and probably will result in greatly impairing the navigability of the Sacramento River.

That the acts threatened to be performed by the defendant in continuing to prosecute its mining industry in the manner set out in these findings, as it will do unless restrained, if allowed to be done, will, in connection with like acts by others, obstruct the navigation of the Sacramento River, and fill up, to some extent, Suisun Bay, destroy or injure large amounts of land, and constitute an obstruction to the free use and enjoyment of the property of a large number of citizens of this State.

From these facts the judge drew the following legal conclusions:

1. That the plaintiff's cause of action and its right to the relief in this action demanded, is not barred by all or either of the statutes of limitation pleaded by the defendant in this case or otherwise.

2. That defendant has not acquired any right to the use of the bed of the American River, or of the Sacramento River, as places of deposit for its mining tailings, nor to choke or fill with such tailings the channels of said rivers in the valleys thereof, nor to

flow or overflow the said lands situate along the bank thereof.

3. That the said acts of defendant constitute a public nuisance, in that they are an obstruction of the free use by a considerable number of the citizens of this State of their said lands situate along the banks of said rivers as aforesaid, so as to interfere with the comfortable enjoyment thereof, and in that they unlawfully obstruct the free passage and use in the customary manner of the said Sacramento River.

4. The mining customs, usages, and regulations authorized by the statutes of this State, or recognized by the decisions of its courts, are local in their operation, and have not, and are not intended to have, any effect beyond a mining-bar, diggings, or district in which they have been adopted or recognized.

5. That the mining laws and mining customs or practices of the said Gold Run mining district, in which said defendant's mines are located, mentioned and referred to in the findings of fact herein, were not intended to, and did not, and can not, protect the defendant in the doing of the acts, matters, and things complained of in this action.

6. That the plaintiff is entitled to a decree of this court restraining and enjoining the defendant, its superintendents, agents, and employés from discharging or dumping into said North Fork of the American River, or into Cañon Creek, and also from suffering or causing to flow into said river any tailings, bowlders, cobblestones, gravel, sand, clay, *débris*, or refuse matter perpetually, or until it shall be first shown, upon application made to this court for a modification of such decree, that dams shall have been built in said American River, which will prevent the heavier portion of said material, including the coarser sands, from coming below Alder Creek, or until some other means equally efficacious shall be adopted to impound said *débris*, and which, in the opinion of the court, upon such application, will certainly prevent sand, and all heavier material than sand, from being carried by the water below Alder Creek.

The following is the decree made:

This cause having been duly called for trial upon the complaint and answer, and both parties appearing and waiving a jury trial, the said cause was duly tried before court without a jury, and the court having heard the evidence and the argument of counsel, has duly signed findings of fact and conclusion of law therefrom, which said findings are now duly filed in this court.

Now, therefore, by reason of the premises and of the law, it is considered by the court, and it is ordered, adjudged, and decreed:

That said defendant, and all the officers, superintendents, foremen, agents, and employés thereof, be perpetually enjoined and restrained from discharging or dumping into the North Fork of the American river, or into any stream tributary thereto, and especially into Cañon Creek, any bowlders, cobblestones, gravel, or sand from the mines; also from causing any such material to flow or to be washed into said river from its said mines or tracts of mineral land.

Subject, nevertheless, to this, that said defendant may at any time, as it shall be advised, apply to this court to have this decree and restraining order modified or vacated and set aside. And whenever upon such showing it shall appear that efficient means have been provided to impound, detain, and hold back such tailings at any point on said American River above Alder Creek, and that such means are sufficient to detain all bowlders, cobblestones, gravel, and the heavier sand, then said defendant shall be entitled to have said decree vacated and set aside.

This result is regarded as a compromise between the extreme views of the farmers on the one hand, and the miners on the other, and as such is favorably looked upon in many quarters. The case will doubtless be carried

by appeal to the Supreme Court. In the course of his findings the judge made the following statement respecting the mining industry of the State:

Competent persons estimate the entire product of gold from California mines at \$1,154,689,039 up to June, 1881, \$900,000,000 being from the ancient channels. The present yield varies between fifteen and twenty millions per annum, and there is, no doubt, much more gold still remaining in these ancient channels than has been washed out.

Present investments in California mines are estimated at \$150,000,000, \$100,000,000 of which is in hydraulic mines. Some portion of this is, no doubt, in mines which can not be profitably worked.

Mining for gold is the principal industry in fifteen counties of the State, and the population of the mining counties is over one hundred thousand.

This decision was followed by conventions of persons interested on the one side and the other of the question.

A convention of miners was held in Nevada City on the 22d of July, which adopted the following resolutions, among others:

*Resolved*, That this meeting, which is composed of all classes in this community, embracing not only miners of all kinds, but also merchants, mechanics, agriculturists, and laborers, fully realizes the fact that, if mining be stopped or seriously injured, it will result in destroying the value of all sorts of property in these now prosperous counties of Nevada, Sierra, Plumas, and the mining portion of Yuba County; we, therefore, acting in the defense of all classes, pledge ourselves to resist in all proper ways the attacks made upon us by the anti-miners.

*Resolved*, That while we admit that a certain amount of damage has been committed, consequent upon mining operations, yet this damage has been grossly exaggerated, and represents but a small percentage in value of the vast mining industry and the interests which directly and indirectly depend upon mining.

*Resolved*, That with the help of the aid proposed to be given by the General Government, it is now within the power of the miners, and particularly of the miners on the Yuba water-shed, to prevent further damage by the construction of one or more dams across the Yuba River, for the purpose of impounding such *débris* as may hereafter find its way into that river, and also for the purpose of retaining the vast quantities of *débris* now in that stream and its tributaries from passing down into the plains.

*Resolved*, That in consequence of the late opinion of Judge Temple, in whom we recognize an upright and non-partisan judge, we advise the miners upon the water-shed of each river flowing from the Sierra Nevada into the Sacramento or San Joaquin Valley, to follow out the mode judiciously set forth in that opinion, and to organize upon each water-shed where mining is carried on, an association similar to that proposed for the Yuba River, and for the same purposes.

An Anti-Débris Convention held a two days' session in Sacramento, beginning on the 26th of September. About one hundred and ten delegates were present, representing the counties of San Joaquin, Sacramento, Yolo, Butte, Sutter, Yuba, Colusa, Placer, Tehama, and the State Grange Patrons of Husbandry. The call for this convention recites that the object for which it is called is the organization of the residents and property-holders of the Sacramento and San Joaquin Valleys into a compact body, in order that complete protection may be afforded to all persons, property, and water-courses therein, from further injury by the

vicious and now judicially condemned system of hydraulic mining.

It was stated by the temporary chairman that "the territory subject to the evils of hydraulic mining is larger than either Massachusetts or New Jersey, and nearly the size of Vermont, and in it dwell 118,785 people, and in it is property valued at the lowest at \$77,000,000. The section has already suffered over \$23,000,000 at the lowest calculation. Through the territory affected the Sacramento River flows, staggering with loads of *débris* from the Feather and American Rivers. The value of the navigation of this stream is partially shown by the statement that this year 83,000,000 bushels of wheat will be shipped to market by it, of which 7,000,000 were raised on the margins of the Feather River."

Provision was made for the formation of a permanent organization to further the objects of the convention. The following resolutions, among others, were adopted:

*Resolved*—1. That we disclaim any desire to interfere with either drift or quartz mining, or to do anything against any lawful rights of hydraulic miners.

2. That as it is the duty of the State of California to defend herself against such terrible mutilation, and to protect the people of the valley in the peaceful enjoyment of their homes and of the fruits of their labors, and as the two leading political parties have ignored this duty, we call upon the people of the State, irrespective of political affiliations, to aid us in the defense of our homes and in our demands for justice by electing representatives to the next Legislature only such candidates as are willing to pledge themselves to the promotion of these objects.

3. That we favor the passage of a law whereby the several parties committing a common nuisance may be joined in one suit.

4. That the system of impounding mining *débris* by the construction of dams in our rivers and their tributaries is a delusion and a snare, and would prove a constant source of danger, and that we are opposed to remedial measures based on such a system, and pledge ourselves to resist all legislation looking to a compromise of the slickens question on such a basis; that we oppose the expenditure of one dollar of the recent appropriation made by Congress for improving the navigation of the Sacramento and Feather Rivers and their tributaries by the construction of dams for impounding mining *débris*, and demand that it be expended in accordance with the letter and spirit of the law in improving the navigation by deepening their channels.

A committee of twenty was appointed to attend the Farmers' Convention to be held in Stockton on the 7th of October, to which committee was referred the question of nominating candidates.

A convention of citizens and supervisors of the counties interested had been held in Sacramento on the 3d of May, by which resolutions similar to the foregoing had been adopted, and concert of action among the supervisors provided for.

**RAILROAD TAXATION.**—Among the questions relating to railroads which have arisen under the new Constitution of the State, perhaps that of taxation has been the most vexed. The disputes culminated in the case of the County of San Mateo against the Southern Pacific Rail-

road Company, originally commenced in the Superior Court of the State and removed into the United States Circuit Court, which reached a decision in September before Justices Field and Sawyer.

By the Constitution of California, all property in the State, not exempt under the laws of the United States, is, with certain exceptions, to be taken in proportion to its value, to be ascertained as prescribed by law; but, in the ascertainment of its value as a basis for taxation, a distinction is made between the property owned by individuals and that owned by railroad corporations. By the thirteenth article, a "mortgage, deed of trust, or other obligation by which a debt is secured, is treated, for the purposes of assessment and taxation, as an interest in the property affected thereby," and, "except as to railroad and other *quasi* public corporations," the value of the property affected, less the value of the security, is to be assessed and taxed to its owner, and the value of the security is to be assessed and taxed to its holder (section 4). But by the same article "the franchise, roadway, road-bed, rails, and rolling stock of all railroads operated in more than one county" are to be assessed at their actual value, and apportioned to the counties, cities, and districts in which the roads are located, in proportion to the number of miles of railway laid therein. No deduction from this value is allowed for any mortgages on the property.

By the Constitution there is also a different system of assessment provided for "the franchise, roadway, road-bed, rails, and rolling-stock" of railroads operated in more than one county from that provided for the assessment of other property. The assessment of other property is to be made in the county, city or district in which it is situated, in the manner prescribed by law; and the supervisors of each county constitute a Board of Equalization of the taxable property of the county, and must act upon prescribed rules of notice to its owners. A State Board of Equalization is also created by the Constitution to equalize the valuation of the taxable property of the several counties, so that equality may be preserved between the tax-payers of the different localities, and its action in this respect must likewise be upon prescribed rules of notice.

The assessment of the franchise, roadway, road-bed, rails, and rolling-stock of railroads operated in more than one county in the State is to be made by this State Board. And in making it the board is not required to give any notice to the owners, nor is any provision made for affording them an opportunity to be heard respecting the valuation of their property. The tenth section of the article which confers this power of assessment has been held by the Supreme Court of the State to be self-executing, requiring no legislation for its enforcement.

The railroad company contended that the

taxes are invalid and void on two grounds: First, because the assessment, according to which they were levied, was made in pursuance of the discriminating provisions of the State Constitution, in the enforcement of which the company was not allowed any deduction from the valuation of its property for the mortgage thereon, and was thus subjected to an unjust proportion of the public burdens, and denied the equal protection of the laws guaranteed by the fourteenth amendment of the Federal Constitution; and, second, because the assessment was made in pursuance of provisions of the State Constitution, which gave no notice to the company, nor afforded it any opportunity to be heard respecting the value of the property, or for the correction of any errors of the board, thus depriving it of its property without due process of law guaranteed by that amendment.

The plaintiff, on the other hand, contended: 1. That the power of taxation possessed by the State is unlimited except by the Constitution of the United States, and that its exercise can not be assailed in a Federal court, either for the hardship or injustice of the tax levied.

2. That the classification of property for taxation, and the apportionment of the taxes according to such classification, are not forbidden by the Constitution of the United States; and that within such classification the property of the railroad company and the apportionment of taxes to it are to be placed.

3. That the fourteenth amendment of the Constitution of the United States was adopted to protect the newly-made citizens of the African race in their freedom, and should not be extended beyond that purpose.

4. That corporations are not persons within the meaning of that amendment.

5. That the statute fixing the sessions of the State Board of Equalization and requiring a statement in writing from the defendant of the amount and value of its property, afforded all the notice and hearing essential to the validity of the assessment made; and—

6. That the provisions of Article XIII of the Constitution, as to the taxation of railroad property, are to be treated as conditions upon the continued existence of railroad corporations.

The court decided in favor of the railroad company that the provisions of the California Constitution relating to the assessment and taxation of railroads were repugnant to the terms of the fourteenth amendment to the Federal Constitution, and that the taxes sued for could not be recovered. The case now goes to the Supreme Court of the United States. It is claimed that the logic of this decision renders invalid many provisions of the State Constitution relating to the railroad commission created by it.

**POLITICAL CONVENTIONS.**—The political campaign, while not an excited one, aroused deep

interest. The chief local questions were the "slickens" or *débris* question, the Sunday law, the management of railroads, and the restriction of Chinese immigration. No new Sunday law had been enacted, but the attempted closing of drinking-saloons by the temperance people under the old law called forth the opposition of the saloon keepers and frequenters. The act of Congress relating to Chinese immigration, while not giving the people of the Pacific coast all that they had demanded, yet sets that question at rest for the present.

The Democratic State Convention met in San José on the 20th of June, and remained in session five days. The following platform was adopted:

The Democracy of the State of California, as represented in convention, hereby declare that, with unshaken faith in the soundness of the constitutional principles and traditions of the Democratic party, as illustrated by the teachings and example of a long line of Democratic statesmen and patriots, and expressed in the platform of the last Presidential Convention of the party, we pledge ourselves to maintain these principles and to labor to make them paramount in the administration of the State and General Government.

*Resolved*, That the Democratic party of California tenders its thanks to the Democracy of the Union for a long, earnest, and partially successful struggle, through the Democratic Congressmen, with a hostile Republican Administration against Chinese immigration and in behalf of the highest interests of the people of this coast. Such action again illustrates the fidelity of the party to its pledges, given to the people in the platforms of successive Presidential Conventions. It again recognizes that the people of each locality are the best judges of their own wants and necessities, and again declares the great doctrine that it is the duty of the General Government to heed their complaints, and to extend its strong arm for their protection.

*Resolved*, That the Democratic party of California recognizes with the highest appreciation the prompt and determined movement in their behalf made by the working-men of the Eastern States, and notably of Pennsylvania, in presenting the menace of a free people as an irresistible power against the combined efforts of vast moneyed corporations and the monopolists of the Chinese trade, who, in the name of the brotherhood of man, and under the cloak of universal charity, were endeavoring to thwart every effort made in behalf of the permanent existence of the white man of California; we recognize the interests of white labor everywhere as in full alignment with the advancing movement of the Democracy of the Union in its purpose to preserve the heritage we have a right to enjoy from the merciless ravages of the Asiatic hosts who have already captured many of our best industries, impoverished thousands of our people, drawn large numbers into debauchery and crime, and almost excluded Eastern and European immigration.

*Resolved*, That the Chinese now in California are an unmixed curse to this people, their presence an ever-increasing evil, threatening to block every avenue of labor and every branch of trade, and, so long as they remain, will continue to be an insurmountable barrier in the pathway of California toward the high destiny for which Nature has so amply equipped her; that, in view of this condition, we confidently appeal to the Democracy of the Union for our deliverance, and claim as one of the first duties of the party that the next Presidential Convention of the Democracy shall declare the doctrine of self-preservation the highest law of nature and of nations upon this subject, as upon all others, and the Government of the United States, then placed under Democratic administration, will in-

dictate its just appreciation of the imperious necessities of the people of California, by providing such certain and speedy means as may be deemed most just and proper for the removal of every Mongolian from this country, and to the accomplishment of this end we hereby pledge to the people our earnest and persistent efforts, inviting every citizen of this State who has the Commonwealth at heart, whatever his present or previous political affiliation, to lend us the aid of his personal support as a freeman toward strengthening the right arm of the Democratic party of the Union, whose fidelity has been proved, for the early and perfect accomplishment of this great work.

*Resolved*, That the constant pretense of the Republican party organs, and of the Republican leaders in California and in the Eastern States, that the "ten-year law" had taken the Chinese question from the arena of political issue, is deceptive in purpose, and will ever be false in fact so long as the Chinese remain in this country.

*Resolved*, That the Democratic party, inheriting the doctrine of Jefferson and Jackson, hereby declares its unqualified enmity to all sumptuary legislation, regarding all such exercises of the law-making power as against the just objects of free government, and that all laws intended to restrain or direct a full and free exercise by any citizen of his own religious and political opinion, so long as he leaves others to enjoy their rights unmolested, are anti-Democratic and hostile to the principles and traditions of the party; create unnecessary antagonism; can not be enforced, and are a violation of the spirit of republican government; and we will oppose the enactment of all such laws, and demand the repeal of those now existing.

*Resolved*, That the railroad fares and freights should be materially reduced, discriminations in favor of localities and persons should be prohibited, and we condemn the majority of the Railroad Commissioners of this State for their faithlessness in the discharge of their official duties. The nominees of the Democratic party will, if elected, carry out in letter and in spirit the declarations of this resolution, and relieve the people, to the extent of their jurisdiction, from the exactions and injustice now practiced with impunity by the railroad companies.

*Resolved*, That most speedy and effective measures should be taken to compel the railroad corporations of California to pay their taxes. No compromise should be made. The property of every corporation, as well as that of every individual, should be assessed at its true value, and the payment of the resulting tax be strictly and impartially enforced.

*Resolved*, That all railroad land grants forfeited by reason of non-fulfillment of contracts should be immediately revoked by the Government, and that henceforth the domain be reserved exclusively as homes for actual settlers.

*Resolved*, That the Democratic party declares its unalterable purpose to restrain all private and public corporations within the exact letter of their lawful powers, and to prevent any and all imposition upon individuals or the public, whether attempted under the features of "lawful right," or in the arrogance of accumulated money power, and favors the referring enactment of all needful legislation toward this end.

*Resolved*, That the rivers and harbors of this State belong to all the people, and that it is the duty of the Federal Government to protect them from destruction, and to so improve them from time to time as to keep them forever open as channels.

*Resolved*, Recognizing the fact that much of the corruption in politics results from the enormous patronage in the hands of the President of the United States, and its unscrupulous use in carrying elections and maintaining the party in power; and that, so long as the temptation exists, this patronage will be used, thereby degrading party contests to the debasing level of a mere scramble for the petty offices in the gift of the Executive Department, the Democratic party of the State of California announces itself as in favor of

a reform of the civil service of the country upon principles similar to those proposed in the bill introduced in the Senate of the United States by Senator Pendleton, of Ohio.

*Resolved*, That the Democratic party recognizes the duty of the State of affording to every child within its limits the advantages of a common-school education, and it believes in fostering and protecting the common schools and maintaining in them the highest standard of efficiency.

The following is the ticket nominated:

For Governor, George Stoneman; for Lieutenant-Governor, John Daggett; for Judges of the Supreme Court, J. R. Sharpstein, E. M. Ross.

For Congressmen at large, Charles A. Sumner, John R. Glascock; for Secretary of State, T. L. Thompson; for State Comptroller, John P. Dunn; for State Treasurer, W. A. January; for Attorney-General, E. C. Marshall; for Surveyor-General, H. I. Willey; for Superintendent of Public Instruction, W. T. Welcker; for Clerk of the Supreme Court, J. W. McCarthy.

Congressmen—First District, W. S. Rosecrans, of San Francisco; Second District, James H. Budd, of San Joaquin; Third District, Barclay Henley, of Sonoma; Fourth District, P. B. Tully, of Santa Clara.

Board of Equalization—First District, Charles Gildea, of San Francisco; Second District, W. M. Crutcher, of Placer; Third District, Caleb S. Wilcoxson, of Sutter.

Railroad Commissioners—First District, J. G. Carpenter, of El Dorado; Second District, William P. Humphreys, of San Francisco; Third District, W. W. Foote, of Alameda.

The Republican State Convention met in Sacramento on the 30th of August, and remained in session four days. The following platform was adopted:

The Republicans of California, in State Convention assembled, do announce and declare:

1. We reaffirm our adherence to the principles of the Republican party as embodied in its history.

2. We lament the death of our late President, James A. Garfield. His lofty patriotism and heroic character endeared him to the people. His memory will be fondly and forever cherished by his countrymen.

3. We reaffirm the platform of the national Republican party as declared at Chicago in 1880.

We have faith in the wisdom of the present Administration, and confidence that it will result in honor and additional laurels to our party and its cause.

4. We point with pride to the financial policy of the Republican Administration, which has with unexampled rapidity reduced the national debt while improving the national credit, lessened taxes while increasing revenues, and lowered the rate of interest on the national bonds while adding to their value in the markets of the world.

5. History and experience unite to prove the necessity of preserving one day in seven as a day of rest from labor. Without legislation on this subject the laboring-classes might be compelled to continue in unceasing toil. Therefore, we are in favor of observing Sunday as a day of rest and recreation; and while we expressly disavow the right or the wish to force any class of our citizens to spend that day in any particular manner, we do favor the maintenance of the present Sunday laws, or similar laws, providing for the suspension of all unnecessary business on that day.

6. Corporations are creatures of law and subject to

law, and all legal means should be taken to render it impossible for aggregations of capital to become oppressive.

7. While we recognize the fact that the building of railroads has proved one of the most potent agencies in the development and progress of the country, we at the same time remember that the great power which authorized such roads to be built, including the sovereign right of eminent domain, was granted to the railroad companies by the people, for the people, and on the sole ground that the construction and working of railroads constitute a public use, and such roads public highways.

We declare that railroad companies, the same as individuals, should be dealt with in fairness and without injustice; but, by reason of their relation to the people, they must be kept subordinate to the interests of the people, and within governmental control.

The people should be protected by law from any abuse or unjust exactions.

Unjust discriminations against individuals or localities should be prohibited.

Equal service upon equal terms to all persons should be enforced.

Charges for transporting persons and property should be limited to what is required to pay the legitimate expenses of operating such railroads, their maintenance in good repair, and a fair interest on their actual value. Such value should bear the same relation to its assessed value that the value of other property does to its assessed value.

Charges in excess of this are in violation of the fundamental law of public use, which allows railroads to be built; and we hereby pledge our nominees for Railroad Commissioners to the enforcement of these principles by such a material and substantial reduction of the rates of fares and freights as will secure that result—the basis being cost of service with reasonable allowance for interest and repairs as above indicated, instead of the mercenary exaction of "all the traffic will bear."

8. That the proper public authorities should not refuse to act in regulating freights and fares by reason of lack of exact information in any particular, if such information could be given but is refused by the railroad corporation, but in such case these authorities should act as nearly correctly as possible, taking care, however, that the public interest should not suffer, and holding themselves in readiness to correct any error, if error there should be, upon the corporation giving the necessary information to enable such error to be corrected.

9. We denounce the railroad contract system as a deliberate attempt to enslave the commerce and trade of the whole Pacific coast, and subjugate them to the control and caprice of the railroad companies. It is against public policy, because it seeks to make use of the national bounty to break down that healthful competition which it is the policy of the nation to encourage. It is unjust and oppressive, because it discriminates in favor of the strong at the expense of the weak, and offers bribes to the rich which it collects back from the poor. It is arbitrary and tyrannical, because it arrogantly interferes with the freedom of trade, and proposes to prohibit those who make use of its transportation facilities from doing business with any one who refuses to submit to its dictation. Its existence is a threat, and its abolition a necessity. The Republican party pledges itself to prohibit the making of such contracts by proper legislation, to the extent, if necessary, of making the same a public offense.

10. We demand of Congress legislation governing the carrying-trade between the States or States and Territories. The rates of freights and fares of all railroads engaged in such trade should be justly regulated and restricted, and any unjust discrimination between persons or places should be absolutely prohibited.

11. That we are opposed to granting any further

subsidies to companies or corporations, and are in favor of the immediate revocation of all land grants and subsidies forfeited by non-fulfillment of the conditions of such grants, and the restoration of such lands to the public domain, to be held exclusively for actual settlers.

12. All property should pay its just share of taxation. The property of corporations, like other property, should be assessed at its actual cash value, and the corporations and individuals alike should be compelled to pay their just taxes without abatement, diminution, or compromise.

13. The Republican party has always advocated liberal appropriations for the improvement of rivers and harbors, and we declare it to be the duty of the Federal Government to maintain the natural channels of internal commerce in their highest standard of usefulness, as a trust committed to it by the Constitution of the United States, and as a constant check upon the exorbitant exactions of artificial highways.

14. We are in favor of establishing a Bureau of Statistics of Labor, for the purpose of collecting and publishing such statistics and other information in regard to labor and wages as may be useful to the laboring-classes.

15. The Republican party is unalterably opposed to Chinese immigration. It is a cause for congratulation that this question, which has heretofore engaged the earnest attention of both political parties, has at length been settled by suspending further immigration, the treaty having been framed by Republican commissioners and ratified and approved by a Republican Administration. We offer our thanks to our Senators and Representatives in Congress for the legislation procured by them on this subject.

16. The same principles which guide the administration of well-ordered private affairs should prevail in the selection of public officers. Honesty, efficiency, and fidelity should be the essential qualifications for public position, and such rules should be established to regulate appointment to the public service as will insure fitness, to be ascertained by practical tests, and promotion should follow faithful service. The Republican party of California demands a thorough, radical and complete reform in the modes of appointment to subordinate executive offices, founded upon the principle that public office is a public trust, admission to which should depend upon proved fitness, to be ascertained by methods open to all applicants and regulated by law.

17. Finally, we insist upon economy in the administration of the Government, integrity in office, and honesty and efficiency in every branch of the public service.

The following planks were added:

The Republican party demands that the public schools shall receive generous support as the policy of free government; that education, from the primary school to the State University, shall be free and within the reach of the children of every citizen; that in furtherance of this principle we recommend to the Legislature the establishment of some system by which the State should print and provide the principal reading and other text-books used in the public schools, supplying the same to pupils at actual cost.

The following is the ticket nominated:

Governor—Morris M. Estee, of Napa; Lieutenant-Governor, A. R. Conkling, of Inyo; Secretary of State, F. A. Pedlar, of Yolo; State Comptroller, W. A. Davies, of Tuolumne; State Treasurer, John Weill, of Sierra; Attorney-General, A. L. Hart, of Colusa; Surveyor-General, William Minto, of Modoc; Superintendent of Public Instruction, S. D. Waterman,

of San Joaquin; Clerk of the Supreme Court, Frank Gross, of San Francisco; Justices of the Supreme Court, John Hunt, Jr., of San Francisco, and S. C. Denson, of Sacramento.

Congress—First District, Paul Neumann, of San Francisco; Second District, Horace F. Page, of El Dorado; Third District, J. J. De Haven, of Humboldt; Fourth District, George L. Woods, of San José; at large, Henry Edgerton, of Sacramento and W. W. Morrow, of San Francisco.

Board of Equalization—First District, R. P. Johnson; Second District, L. C. Morehouse, of Alameda; Third District, G. G. Kimball, of Tehama; Fourth District, C. W. Dana, of San Luis Obispo.

Railroad Commission—First District, Charles F. Reed, of Yolo; Second District, Charles Clayton, of San Francisco; Third District, E. M. Gibson, of Alameda.

Morris M. Estee, the Republican candidate for Governor, was born in Warren County, Pennsylvania, in 1833. At the age of twenty he went to California. After following various occupations, he was admitted to the bar of the Supreme Court in 1859. He was elected to the Assembly from Sacramento County in 1862. He served one term as District Attorney of Sacramento County. In 1866 he removed from Sacramento to San Francisco. For the greater part of his political career he has been a Republican. He was Secretary of the Republican State Central Committee in 1871, when Newton Booth was elected Governor. In 1872 he came out for Greeley on the Democratic ticket, and opposed the election of General Grant. In 1875 he was elected on the Independent or "Dolly Varden" ticket to the Assembly from San Francisco, and was elected Speaker of the Assembly for that session. He was elected as delegate at large to the Constitutional Convention which framed the present Constitution of the State in 1879, and was chairman of the Committee on Corporations in that body. Mr. Estee is a vigorous campaign speaker.

The Greenback State Convention met in San Francisco on the 6th of September. The platform adopted is practically a reproduction of that adopted by the St. Louis Convention of the previous March, with the addition of a clause favoring the Sunday law in a modified form. It nominated a full State ticket, Thomas J. McQuiddy being the nominee for Governor and Mrs. Marion Todd for Attorney-General.

The Prohibition Home Protection party also held a State Convention in San Francisco, and adopted a platform of principles, including the following:

We declare the cardinal principles of our party to be the prohibition, by constitutional amendment, of the manufacture of all alcoholic liquors not demanded for medicinal, mechanical, or scientific use, and the regulation by law, under severe penalties, of the sale of alcoholic liquors for such use, and the absolute and total prohibition of the sale for any other purposes.

We demand the enactment and enforcement of an

intelligent and rational Sunday law, and especially do we demand that all saloons or places of business where intoxicating drinks are now licensed to be sold or permitted to be sold on secular days shall be absolutely closed on Sunday.

We emphatically protest against all State subsidies or other countenance to encourage the business of making intoxicating drinks from grapes.

We believe that the State should assume control of the water-supply for irrigating purposes, and provide at once by suitable legislation for the equitable distribution of the same.

We shall insist upon such amendments to existing laws as shall fully and forever enfranchise the women of our country.

The following resolution, which was adopted, brought on a warm debate:

*Resolved*, That we hail with pleasure the cultivation of the grape in this State, as offering our people a most pleasant, healthful, and remunerative occupation, and an incalculable and inexhaustible mine of wealth for centuries to come. An unlimited market will always be found for all the raisins, sirups, canned fruit, and fresh grapes that the State can produce. We are assured from our own experience so far, and from the past history and the present condition of the people who have prostituted the luscious grape to the vile uses of drunkenness, that the wine and brandy manufacture is the most degrading, demoralizing, depraving, and pauperizing business which has ever cursed the world. We point for the truth of this to the utter ignorance, poverty, drunkenness, and moral ruin which have enshrouded Spain, Portugal, Italy, Sicily, Greece, Hungary, and the wine districts of Switzerland; to the vice, turbulence, drunkenness, insanity, and suicides of France, and to the rapid degeneration of its people. We point to the fact that only one half of the young men of France are physically fit for military duty when they arrive at legal age. We denounce the promises of wealth from the production of wine as entirely baseless and false.

A resolution was adopted setting out that the loss to the State's revenue through prohibition would be more than compensated for through the diminution of taxes for the support of criminals and paupers, who will disappear with the success of prohibition.

A ticket was nominated by this convention, headed by Dr. R. H. McDonald, of San Francisco, for Governor.

The Farmers' Anti-Monopoly Convention met in Stockton on the 7th of October. The platform adopted related chiefly to the railroad question, and was in substance as follows: Railroads to be controlled by the State; justice to both labor and capital; railroads are public highways, to be operated for the transit of all persons and property on equal and impartial terms. Railroad operatives are common carriers, and their charges should be based on "cost of service," against all kinds of discrimination. Insurance no longer should form a part of the contract for carriage, but should be optional. Carriers by rail to be liable as are bailees for hire. Railroad charges are excessive. The management of railroads by private corporations is a public trust. Private tariffs and special contracts condemned, and they should be made offenses before the law. Favoring the Reagan bill. The Legislature to re-enforce the powers of the Railroad Commissioners by enlarging legal remedies,

etc. Revision of all the laws relative to railroads, defining their rights and duties, and enforcing obedience.

The final plank, referring to the recent decision of the United States Circuit Court as to railroad taxes, and the proper assessment of railroad property, reads:

To award the time necessary to secure a decision of the question by the United States Supreme Court before action would derange the finances of the State and counties to such a degree that we deem it best to assume the correctness of the decision, and amend the Constitution at the coming session of the Legislature, so as to make the mode of assessing railroad property subject to mortgage the same as that adopted in the case of individuals, and provide for the assessment and collection of the taxes remaining unpaid.

The candidates for Railroad Commissioners were required to agree to move within thirty days after election to reduce freights and fares 20 per cent.

For Railroad Commissioners the Democratic candidate in the Third district and the Republican candidate in the First were endorsed. In the Second district John T. Doyle, a Democrat, was nominated. For the State Board of Equalization the Republican candidates in the Fourth and Second districts and the Democratic candidate in the Third were endorsed. In the First district, James Withington, of San Francisco, a Republican, was nominated. For Controller, the Democratic candidate was endorsed. No other nominations were made by the convention.

The election in November resulted in the choice of the entire Democratic State ticket by a large majority, and of Democratic congressmen in each district. The new Legislature will be largely Democratic in both branches.

The vote for Governor was as follows: Total, 164,657; Democratic, 90,649; opposition, 74,008; Democratic majority, 16,641.

**CAPE COLONY AND BRITISH SOUTH AFRICA.** The Cape of Good Hope is a British Colony at the southern extremity of the Continent of Africa. It was first settled by the Dutch, and passed into the possession of Great Britain during the Napoleonic wars. It has had a responsible government since 1872. The Parliament consists of a Legislative Council of 21 and a House of Assembly of 68 members, both elected by voters qualified by a certain amount of income. The Governor is Sir Hercules G. R. Robinson, appointed in 1880. The Prime Minister is T. C. Scanlen, as Sir John C. Molteno, who formed a ministry in which the Dutch land-owners of the western districts were fully represented after the defeat of Gordon Sprigg and the British party, has retired from office.

**AREA AND POPULATION.**—The area and population have been more than doubled by the annexation of British Caffraria, in 1866; Basutoland, in 1868 (area 7,000 square miles, population 127,000); the Transkei, or Caffreland proper (area 17,000 square miles, popu-

lation 475,000), between 1875 and 1880; Griqualand West, in 1876 (area 17,800 square miles, population 45,277); and the Transgariep or Damara and Namaqua Lands, in 1880 (area 200,000 square miles, population 200,000). The administration of the native districts is not successful. The whole of South Africa is kept in a disturbed condition by the encroachments of the rival white races upon the blacks, and the resistance of the vigorous Caffre race. The situation is complicated by the jealousy between the Boers and the English, and their intrigues with the Caffre tribes. The area of Cape Colony proper is 199,950 square miles. The population, according to the census of 1875, was 720,984. The 236,793 whites (123,910 males and 112,873 females) consist mostly of the descendants of the original Dutch, German, and French settlers; the English settlers and authorities being greatly in the minority. The native population comprises, besides the Hottentots and Caffres, a considerable number of colonized Malay laborers, and the offspring of Dutch fathers and black women, who are commonly called Africaners.

**COMMERCE.**—Wool is the principal product, constituting nine tenths of the total exports. There are many large sheep-farms, ranging from 3,000 to 15,000 acres. The exports of wool in 1880 amounted to 42,226,044 pounds. Ostrich-feathers were exported of the value of £958,254, copper-ore of the value of £301,585, and sheep-skins of the value of £238,102. Diamonds are a very important article of export, but most of the trade is through secret channels. The total exports were returned for 1880 as £4,340,017, the imports as £7,643,863. The trade is mainly with Great Britain. There were 692,514 cattle and 9,836,065 sheep in the colony at the end of 1875. On January 1, 1882, the mileage of railroads was 961, and of telegraphs 3,575 miles. To the harbor improvements of Table Bay, at Cape Town, a graving-dock has been added, and a new outer harbor is to be constructed by extending the breakwater 1,800 feet, and building projecting moles to inclose a large area of deep water. The existing basins were completed a year after the Suez Canal. Instead of shipping deserting the port, the tonnage in 1881 was four and a half times as great as before the canal was opened. A fever of speculation in diamond shares led to a crisis in 1881, and ostrich-farming declined from over-production; but the country is generally prosperous and commercial interests are expanding.

**FINANCES.**—Public finances are in a flourishing condition. The revenue of 1881-'82 amounted to £3,492,396, being £524,196 beyond the estimate. The revenue for 1882-'83 is estimated at £3,572,110, and the expenditures at £3,530,118. Out of the surplus receipts a temporary loan obtained to meet the Basuto war expenses, and a claim of the Im-

perial Government on account of the Caffre war of 1878, were discharged.

**NATAL.**—Natal, on the east coast, was constituted as a separate colony in 1856. The colony has an estimated area of 21,150 square miles. The population in 1881 numbered 406,625, comprising 25,271 persons of European descent, 362,477 blacks, and 18,877 coolies. The chief product is wool, which is exported to Great Britain to the value of £500,000 annually. Cotton-raising commenced in 1866, but the exportation of raw cotton has entirely ceased. Sugar is also grown. The exports to Great Britain in 1880 were returned as £615,029, and the imports from that country as £1,651,706. Many of the exports, particularly wool, come from the Dutch republics, which absorb over one third of the imports. There is no trade of any account, except with Great Britain. A railroad 105 miles in length, which was authorized in 1875, has been completed. The company received a land grant of 2,500,000 acres, the right to certain coal-beds, and an annual subvention of £40,000, which is  $3\frac{1}{2}$  per cent on the cost. The construction of 118 miles more has been authorized. The revenue in 1880 was £582,715, and the expenditure £477,100. There is a public debt which amounted in 1881 to £1,631,700, on which 6 per cent interest is paid. About one fourth of the revenue is derived from customs and the rest from various sources, including the hut-tax of 14s. collected from the natives, which was paid on 85,714 huts in 1878.

**PUBLIC AFFAIRS.**—The abandonment of the South African policy of the Beaconsfield administration, upon the accession of the Liberal ministry in Great Britain, caused the complexion of politics at the Cape to change. The Tories adopted the scheme of building up a South African confederation, which the Dutch Republics were constrained to enter. It was first necessary to thoroughly subjugate the native races. This part of the scheme pleased all the whites. The British party were in the ascendant at the Cape. The Gladstone administration proposes to leave the Cape Colonists to settle all difficulties which arise between them and their neighbors, white and black. The former policy not only fanned the cupidity of the whites and stirred up native wars all along the border, but brought the whole Boer population into a dangerous state of disaffection. The country is gradually becoming quiet under the policy of non-interference. The Dutch yeomen of the older settlements have asserted their preponderance. The Cape Parliament has passed a resolution allowing the Dutch language to be spoken in debates, but the Boer representatives continue to use English. The English colonists of the eastern districts, coveting the lands of the peaceable and industrious Basutos, passed a disarmament act through the Legislature, and attempted to conquer their country as a penalty

for non-compliance (see "Annual Cyclopædia" for 1881). The colonists soon tired of carrying on a Caffre war at their own cost. The Dutch colonists of the west had nothing to gain from the war, and when the Imperial Government announced that there should be no confiscation of lands, the peace party became strong enough to repeal the disarmament act and proclamation. The arbitration of terms with the Basuto chiefs was left to Sir Hercules Robinson. The majority of the Basuto nation agreed to pay a large fine in cattle, and accept a protectorate and the imposition of a small hut-tax. Masupha and certain other chiefs refused to accept terms after their successful defense. The famous Colonel Gordon was commissioned to arrange the disputes. When he was on the eve of a satisfactory settlement the chiefs broke off negotiations on account of an act of the Cape Legislature, and Gordon resigned.

The Basuto question is far from being settled. A precarious peace has been kept up by playing off the different chiefs against each other. Leshuburn was threatened by Lethorodi that, if he did not pay his hut-tax to the Government, he should be "eaten up." Masupha threatened the same treatment to Lethorodi if he did not pay the tax. The administration of Basutoland costs £10,000 a year, which must be paid out of the Cape revenue unless local taxes can be collected. The difficulties are augmented by the squatting of Dutch and English settlers in the land. The scheme has been broached of providing lands for the loyal natives elsewhere, and leaving the rest to themselves. New complications with the native races have been prepared by an irruption of Dutch squatters into Tembuland in defiance of the land regulations set up by the Cape Government. In West Griqualand, Mankoroane and Montsioa, two chiefs who aided the British in the war in the Transvaal, have been at war, the latter with Moshette and the former with Massouw, who are befriended by the Transvaal Boers. Boer recruits enlisted with these chiefs, and expeditions were organized on Transvaal territory, while British filibusters joined the other side, and arms were supplied from Barkly. General Joubert stationed guards on the Transvaal frontier to prevent violations of neutrality, but Massouw and Moshette were not hindered from retreating when defeated and from driving captured cattle into the Transvaal. The Transvaal Government represented that the adjustment of the unsatisfactory boundary-line drawn by the commission so as to include the territories of Moshette and Massouw in the Transvaal, would end the disturbances. British freebooters and certain of the Caffre tribes of the Transvaal who refuse to pay taxes are endeavoring to provoke conflicts, with the object of securing the reannexation of the Transvaal, but the present British Government will rebuke such an agitation. There is no disposi-

tion to interfere in the native affairs of the Transvaal, but the resettlement of the boundaries which the Boers say they accepted on compulsion, is an open question.

**CETEWAYO'S RESTORATION.**—The Zooloo question affects more particularly the colony of Natal. After the capture of Cetewayo, or Ketchwayo, Zoolooland was apportioned among thirteen chiefs. One of these was John Dunn, Cetewayo's treacherous Irish lieutenant, who was appointed British Resident, but afterward replaced by a more respectable representative. The country, which is about half the size of Natal, was left in a state of famine by the war and the subsequent confiscation of the King's treasury, which consisted of all the cattle in Zoolooland, its only wealth. Three of the appointed chiefs, John Dunn, Hamu or Oham, the King's brother, and Zibebu, proved cruel tyrants and robbers, who pillaged and killed the other tribes. The rest of the Zooloo nation, including eight of the appointed chiefs, pined incessantly for their captive monarch, to whom they were attached with the fervor of the negro nature. The intimidations of the three ambitious tyrants, the machinations of Natal politicians and lying interpreters, long prevented the pathetic appeals of the Zooloos for "their bone," as they figuratively designate their King, from coming to the ears of the imperial authorities. Bishop Colenso, of Natal, was the only advocate of the Zooloos. The eyes of Lord Kimberly, the Colonial Secretary, were gradually opened to the true state of affairs. The rights of responsible government had been offered to the people of Natal, if they would conduct their own frontier defenses, but the boon on these conditions was refused. The British Government, after long hesitation, concluded that the restoration of Cetewayo would be the best guarantee of order and peace. The Natal settlers protested clamorously. Previous to his restoration the savage monarch was taken to England to view the majesty and power of the British nation. He passed the month of August in London, and was then conveyed back to Cape Colony with the intention of reinstating him in his kingdom as soon as the difficulties could be arranged. He is to be subjected to conditions similar to those which were imposed upon the thirteen chiefs. He is prohibited from reviving his army. A British resident will remain in the country. The chiefs and people who will not accept Cetewayo's rule will have separate lands allotted to them.

CETEWAYO.

The entire European population of Natal is less than 30,000, while the natives within the borders are ten times as numerous. The proposition that the colony should undertake the management of its own affairs and the responsibility of its defenses came originally from the colonists themselves. The intended restoration of Cetewayo produced a great agitation in the town of Durban, and was the cause of their refusing the independence which they had recently sought. The head of the government of Natal is Sir Henry Bulwer, who was Lieutenant-Governor before the coming of Sir Bartle Frere and the inauguration of the policy which brought discord and confusion in South Africa to a climax, and provoked internecine struggles in the embattled field between all three races. The dispatches of Sir Henry Bulwer, during his former incumbency, bear witness to the fact that Cetewayo neither intended nor committed any acts of hostility toward the colonists of Natal.

**COMMERCIAL DEVELOPMENT.**—Railroad construction is proceeding gradually, and the lines opened return a profit of  $3\frac{1}{2}$  per cent. Of agricultural progress there are few signs. The Transvaal Boers export wool and hides, besides copper, and a little gold and ivory, but the staple exports of the English possessions are diamonds and ostrich-feathers. The increased trade of Cape Town and Port Elizabeth has stimulated enterprise. The improvements in Table Bay Harbor render the port of Cape Town safe and commodious.

**CEREAL PRODUCTION OF THE UNITED STATES.** The cereal production, according to the census of 1880, is reported, at great length, for the counties of each State and Territory. A summary of this report, by States and Territories, is given in the following table:

STATES AND TERRITORIES.	Barley.	Buckwheat.	Indian corn.	Oats.	Rye.	Wheat.
	Bushels.	Bushels.	Bushels.	Bushels.	Bushels.	Bushels.

The number of acres under cultivation is as follows: Barley, 1,997,717; buckwheat, 848,389; Indian corn, 62,368,869; oats, 16,144,593; rye, 1,842,303; and wheat, 35,430,052.

**CHEMISTRY.** The tendency of recent chemical progress, according to Professor Liveing, President of the Chemical Section of the British Association for 1882, has been toward placing the dynamics of the science on a satisfactory basis, and toward rendering an account of the various phenomena of chemical action on the mechanical principles acknowledged to be true in other branches of physics. The most recent work has not been marked by any brilliant discoveries, or by the application of any startling novelties in processes, but has been rather distinguished by efforts to correct and perfect discoveries already made, to confirm advances already attained, to simplify and facilitate the application of principles already wrought out to industrial, economic, and other practical or beneficial purposes. To these categories belong the work in the redetermination and verification of the atomic weights, in which some of our American chemists have played an important part; the progressive improvements that are made

in industrial and manufacturing chemistry, the patient work that is done in physiological chemistry, and the persistent zeal with which all problems that have a bearing on the security of life and health are followed up.

**NEW SUBSTANCES.**—The leaf and wood of the California bay-tree, or laurel (*Umbellularia*, or *Laurus Californica*), a tree the wood of which is much used for veneering and fine cabinet-work—have a very fragrant, aromatic odor, which, when strong, as in the crushed leaf, excites the mucous surfaces, brings tears to the eyes, and produces headache. Mr. J. M. Stillman, of the University of California, has obtained from the leaves, by distilling them with steam, an oil of a clear yellowish or straw color, of the peculiar aromatic odor of the leaf, having a specific gravity at 11° C. of 0.94, which has not thickened after standing for nearly a year. Subjected to fractional distillation it gives up a small quantity of dissolved water, and separates into two principal fractions, one boiling at from 170° to 190° C., and the other at from 210° to 225°, with smaller quantities which pass over at the higher temperature of 260°. The lower fraction mentioned was subjected to repeated fractional

distillation, and gave a considerable quantity of a clear, colorless, mobile liquid, boiling at from 167° to 168° C., though apparently with slight dissociation. A part of the purest of this substance showed, under elementary analysis, a composition corresponding with the formula  $C_{20}H_{32}H_2O$ , agreeing with the composition of terpinol. The compound has an odor not quite identical with that of spirits of camphor, is not readily affected by metallic sodium, even when heated with it, and gives off a vapor of a density calculated at 4.7. The higher fraction (that boiling at from 210° to 225°), when subjected to fractional distillation, gave off a colorless, mobile liquid of aromatic but powerful odor, which boils without decomposition at from 215° to 216°; gives, with sulphuric acid, a blood-red color, turning to brown and black; forms with sodium a blood-red, brittle, resinous substance, and is acted on violently and decomposed by strong nitric acid. Its vapor density is 4.39, and its composition is expressed by the formula  $C_8H_{12}O$ . This substance is isomeric, so far as Mr. Stillman knows, with no other known compound. It is homologous, so far as its empirical formula is concerned, with common camphor, but has different properties.

Messrs. J. M. Stillman and E. C. O'Neill have examined and described a new fat acid from the nut of the California bay-tree (*Umbellularia Californica*). The nuts, when ground and extracted, yielded a content of 59 per cent of the crude fat, which solidified on cooling to a hard, tallowy mass, nearly white, having a specific gravity of 0.925 in the melted condition at 88° Fahr., its melting-point. It is disagreeable in taste, and produces irritation in the throat. When saponified and treated with hydrochloric acid the fat yielded an oily acid layer, which the analysts regard as composed chiefly of a new acid, of the acetic acid series, to which they have given the name, derived from the accepted name of the tree, of *umbellulic acid*. With it there seems to be also present a certain quantity of some higher acid, and possibly a small quantity of some lower acid. Umbellulic acid, the composition of which is expressed by the formula  $C_{11}H_{21}(C_2H_5)_2O_2$ , is a white, crystalline substance of a peculiar taste, which does not appear to be derived from mere impurities, and irritates the mucous membrane of the throat. It distills at the ordinary atmospheric pressure without decomposition, giving a water-clear distillate that becomes, on cooling, a white, crystalline solid. Its melting-point appears to be from 21° to 23° C. (70° to 73½° Fahr.), and its boiling-point from 275° to 280° C. (527° to 536° Fahr.). The results of the analysis are the more remarkable inasmuch as they are not in accordance with the general theory that the natural fats contain only acids with an even number of carbon atoms in the molecule.

Mr. Malvern W. Iles has described a new manganese mineral, which has been found in

Hall Valley, Park County, Colorado. It is a hydrous sulphate of the Epsomite group, and is composed of five equivalents of the sulphate of manganese, with one each of the sulphates of iron and zinc. It is described as composed of loosely adhering, very friable, thick orthorhombic prisms, which are frequently found terminating in truncated pyramids, with a slightly glimmering luster, somewhat resembling pure kaolin, and a number of effervescent salts, of a pure milky-white color, but sometimes stained with sesquioxide of iron, as having a bitter, astringent taste, and as being very readily soluble even in cold water. The aqueous solution effervesces with sodium carbonate, and reddens blue litmus-paper. Its hardness is from .75 to 1, and its specific gravity is 2.167.

Professor F. W. Clark and N. W. Perry describe a new mineral from near Gunnison, Col., for which they propose, if it should prove to be a new species, the name of *gunnisonite*. It is massive, easily scratched by the knife, and has a deep purple color, the tint of which is retained in the powder. At first sight it suggested ytrocrite, and this led to its examination for fluorine. The new mineral is associated with a semi-massive calcite, which in portions is tinged with ferric oxide, and with which it is so interpenetrated that it could not be completely separated mechanically. Its specific gravity is 2.85. The analysis, making allowance for the intermixed calcite, gave for the composition of the mineral nearly the formula  $7 CaO, 2 Al_2O_3, 4 SiO_2, 32 CaF_2$ . An analysis of purer material might give the simpler ratio of four equivalents of the silicate to sixteen of the fluoride.

M. E. Grimaux, having effected a transformation of morphine into codeine, has since succeeded in obtaining a new series of bases from the latter substance. By treating codeine or the sodium derivative of morphine with methyl iodide, he obtained the iodomethylate of codeine, a substance possessing the properties of a quaternary iodide of ammonium. This, treated with silver oxide, is transformed into a solid and crystallizable tertiary base, slightly soluble in water and easily soluble in alcohol and ether, which crystallizes in needles fusing at 118.5° C. The new base appears to be formed by the abstraction of a molecule of water from the quaternary hydrate of ammonium, and to constitute methocodeine,  $C_{18}H_{26}NO_2(OCH_3)$ , an isomer of codethyline,  $C_{17}H_{18}NO_2(OC_2H_5)$ . The substance was also obtained by boiling iodomethylate of codeine with an aqueous solution of potash, but the yield was less than when silver oxide was used. When silver oxide and potash are both used, another tertiary crystallizable base fusing at 132°, and resembling methocodeine, but less soluble in ether, is obtained. This base has not been analyzed as yet, but is probably methocodethyline,  $C_{18}H_{21}NO_2(OC_2H_5)$ . We have here, then, a general reaction by means of which can be obtained homologues of codeine containing new

alcohol groups, not in the phenol hydroxyl of the morphine, but in the hydrocarbon radical of the morphine itself.

M. A. Muntz has obtained, by treating the meal of lucerne with water containing a little neutral acetate of lead, the gum-galactine, a distinct substance which is characterized by its high dextro-gyrate rotatory power, and the property of reducing, under the influence of diluted acids, the sugar of milk. It occurs abundantly in vegetable products, and is found in large quantities in leguminous seeds, particularly in those which do not contain amidon. It is digested by animals, but has not been saccharified experimentally. M. Muntz suggests that the remarkable property of this body of giving rise to galactine permits it to be regarded as forming a part of the materials from which the females of herbivorous animals derive the elements of the sugar of milk that is secreted by their organs of lactation, the origin of which is still involved in mystery. Sugar of milk is of rare occurrence in the vegetable kingdom, and has been detected with certainty only by M. G. Benchardat, in the juice of the sapota.

Dr. T. L. Phipson has described a new coloring-matter, *ruberine*, which he has extracted from the *Agaricus ruber*, a poisonous fungus, and which possesses interesting optical and chemical qualities. It is of a beautiful rose-red color, very similar to that of palmerine; when seen by transmitted light it presents a very vivid blue fluorescence; and it gives in its spectrum two wide and dark absorption-bands in the green. Ruberine is soluble in water and alcohol, in solutions that are rose-red by transmission and blue by reflection. Dr. Phipson imperfectly isolated the alkaloid from the *Agaricus ruber*, which he calls *agaracine*, in the form of a white or yellowish-white amorphous substance, somewhat greasy in aspect, with a distinctly bitter taste, followed by a burning sensation on the tongue and a slight odor of its own kind, easily fusible into pale-yellow globules, and volatile with an odor recalling that of quinoine. It dissolves in alcohol and ether, and slowly but completely in dilute hydrochloric acid. Observing that air transforms the alkaloid into the red coloring-matter, Dr. Phipson concludes that the coloring-matter in the plant is formed from the alkaloid at those points of the fungus that are at the same time in contact with the air and the solar rays—which is where it is most conspicuous. Both plants belong to the aromatic series. As ruberine is very easily soluble in water, it sometimes happens that heavy rains wash it out of the head of the fungus, and give the plant a peculiar bleached appearance.

A new carbon sulphobromide has been obtained by mixing bromine and carbon disulphide, allowing them to settle, distilling off the excess of carbon disulphide, and crystallizing the brownish oily residue under the action of water. It is carbon trisulpho-hexa-bromide

(C<sub>3</sub>S<sub>3</sub>Br<sub>6</sub>), and has the form of small bright prismatic crystals or rhombic plates, fuses at 125° to a red liquid, and solidifies unchanged on cooling. At higher temperatures it decomposes, evolving brown-red condensable fumes, and leaving a coal. When pure is has no odor or taste. It is insoluble in water, and hardly soluble in cold ether, alcohol, and glacial acetic acid.

Mr. Charles Upham Shepard has described two new minerals found in the Tertiary limestone of the Twin Islands, Mona and Moneta, near Porto Rico, West Indies. They have been formed by percolation of water from the superficial beds of guano into the limestone lying under them, and are named *monetite* and *monite*. Monetite occurs in a highly crystalline form, and is described as a crystalline dialcic hydriphosphate, or dialcic-ortho-phosphate differing from that artificially prepared in not containing water of crystallization. Monite is a hydrated tricalcic phosphate, and resembles in color and density the more friable varieties of kaolinite. In the same islands was found a pyroclastic, which may be a uniform compound of monetite and monite, or only a mechanical mixture of the two, and is "eminently prone to admixture with gypsum, aluminum and iron phosphates, silica, and organic matter."

Anhydrous crystalline hæmatein is obtained by treatment of the ammonio-compound of hæmatein with strong acetic acid, in microscopic rhombic plates, solvable in water, alcohol, ether, acetic acid, and alkalies. The composition of the crystals is represented by the formula, C<sub>18</sub>H<sub>12</sub>O<sub>4</sub>. By treating hæmatein with cold concentrated sulphuric acid, and adding acetic acid, Messrs. J. J. Hummel and A. G. Perkin have obtained an orange-colored powder composed of microscopic prismatic crystals of acid isohæmatein sulphate. It is insoluble in alcohol, ether, and benzole, but soluble in ammonia and sulphur solutions, and to a small extent in acetic acid. Isohæmatein chlorhydrin is produced, by heating hæmatein in sealed tubes with hydrochloric acid, in microscopic red needles. It dissolves easily in water, is less soluble in alcohol, and gives a reddish violet solution with alcoholic potash. It is converted by concentrated sulphuric acid into isohæmatein sulphate. With hydrobromic acid, hæmatein gives isohæmatein monobromhydrin. By treating either of the last two substances with argentic hydrate, isohæmatein, isomeric with hæmatein, is obtained.

Crystalline brazilin is obtained from Brazil-wood extract in the same manner that hæmatein is obtained from logwood extract. It forms thin microscopic reddish-brown rhombic plates, very slightly soluble in cold water, more so in hot, and soluble in alkalies. The formula of its composition is C<sub>16</sub>H<sub>12</sub>O<sub>4</sub>H<sub>2</sub>O. With sulphuric acid it gives acid isobrazilin sulphate, with hydrochloric acid isobrazilin chlorhydrin, and with hydrobromic acid the corresponding bromine compound. The tinctorial power of the

new compounds is much greater than that of the original hæmatin and brazilein, and the colors are much faster.

Prof. F. W. Clarke and Mary E. Owens have obtained a number of new substances from the action of potassium cyanate upon the compounds of platinum. With platinum tetrachloride they obtained a buff-yellow precipitate soluble in water, but completely insoluble in alcohol, the aqueous solution of which decomposes on boiling, and to which analysis gave the novel formula,  $K_2PtCl_2(CNO)H_2O$ . With the green salt of Magnus,  $PtN_2H_4Cl_2$ , new compounds were formed, apparently of great complexity. The hot aqueous solution, concentrated to the crystallizing point, deposited pale-yellow needles, containing potassium, ammonia, water, and carbon, with 43.93 per cent of platinum. From the mother-liquor beautiful brown crystals were obtained, in which were found ammonia, platinum, and chlorine. Strychnia chloro-platinate with potassium sulpho-cyanate gave a blood-red solution which, after cooling, deposited a brilliant red crystalline precipitate,  $2(C_{21}H_{22}N_2O_2)H_2PtO_4S_8$ —the strychnia salt analogous to the potassium sulpho-cyanoplatinate.

Ogier has obtained a new oxychloride of sulphur by heating to  $250^\circ$  in sealed tubes a mixture of equal weights of  $S_2Cl_2$  and  $SO_2Cl_2$ . Its composition is expressed by the formula  $(S_2OCl_4)_2 + SO_2 + S$ . It is a dark-red liquid of density 1.656, and of a repulsive odor, recalling that of sulphur chloride, and is decomposed by water and by heat of  $100^\circ$ .

ATOMIC WEIGHTS.—Mr. James Blake, of Calistoga, Cal., has determined the atomic weight of beryllium and its true position among the elements, by the application of the rule that the intensity of the action of different substances upon organisms increases with their atomic weight. Introducing the salts of beryllium to the blood of living animals, he found that the reactions caused by them were the same as those caused by the salts of alumina and ferric oxide, and strikingly different from those caused by the salts of the magnesium group. The metal is therefore placed in the aluminum group; and this determines its atomic weight as 13.65, and the formula for its oxide  $Be_2O_3$ , in accordance with the determinations of Nilson and Pettersson. Roscoe has redetermined the atomic weight of carbon by the method employed by Dumas and Stas, which consists in the direct combustion of the diamond. The mean of six separate experiments, taking the atomic weight of oxygen as 15.96, was 11.9708.

NEW PROCESSES.—The tests for the detection of oleomargarine and of impurities in butter depend upon chemical analysis and upon the determination of specific gravity. Two processes of chemical analysis by saponifying the fat of the butter are used at the Municipal Laboratory in Paris. In the first process, the clear fat saponified with potassic hydrate (three

or four grammes of fat to one or two grammes of hydrate) is mixed with 50 c.c. of alcohol, after which the soap, provided the solution formed is perfectly clear, is decomposed with weak sulphuric acid, and the insoluble fat-acids are collected and weighed. The quantity of fat-acids thus obtained is in butter usually 86.5 to 87.5 per cent, and sometimes as high as 88 per cent; in animal fats from tallow the percentage of insoluble fat-acids is  $95\frac{1}{2}$ . The difference—about 8 per cent—is attributed to the absence in tallow of volatile and soluble fat-acids which exist in butter. In the other process, the result is obtained volumetrically, by estimating the quantity of potassa used in saponifying the fat. One gramme of butter requires from 225 to 232.4 c.c. of potassa solution, while one gramme of tallow or other fat of the same nature requires from 195 to 197 c.c. of the same potassa solution. M. Charles Girard, of the Municipal Laboratory, considers as adulterated any butter requiring, for saponification, less than 221.5 c.c. of the potassa solution.

The test by determination of the specific gravity, as employed by Messrs. Leune and Harburet, consists in placing the clear melted fat in a cylinder heated by the vapor escaping from a boiling water-bath, but no part of which is in the boiling water. By heating in this way, the temperature of the melted fat is kept at about  $93^\circ C$ , or about  $199^\circ$  Fahr. To determine the density of this fat, an areometer is placed in it, so graduated that in butter it will sink to the lowest mark of the scale, while in oleomargarine it will stand at the highest point. The intervening space in the scale is divided into ten equal parts, each one of which corresponds to one tenth of oleomargarine mixed with butter. This instrument is relied upon to give correct results to within ten per cent. Mr. P. Casamajor, from the results of his experiments to ascertain the actual specific gravity of the two substances, has derived another very simple test with alcohol. It consists in finding the grade of alcohol in which the substance will remain at equilibrium in whatever part of the liquid it is placed. Mr. Casamajor found that this was, for butter, alcohol of 53.7 per cent; for oleomargarine, of 59.2 per cent, at  $15^\circ C$ , or  $59^\circ$  Fahr. The fat may be melted in a little spoon or scoop and dropped upon the alcohol, care being taken to have the drop free from air-bubbles. If alcohol at  $56\frac{1}{2}$  per cent—the medium between the two grades specified above—is taken, a globule of melted butter will sink in it to the bottom, while a globule of oleomargarine will remain at the top, both being still warm and liquid. Afterward, if the alcohol is raised to about  $30^\circ C$ , or  $86^\circ$  Fahr., the butter will become solid, while the oleomargarine may still remain liquid. Then the butter will rise to the top of the alcohol. If the alcohol is then kept for a few minutes at  $15^\circ C$ , the oleomargarine will become opaque and remain at the top,

while the solid globule of butter will sink to the bottom. If we use alcohol of 59 per cent, oleomargarine will remain on top, and butter will sink to the bottom, at all temperatures above 15° C. At 15° C. oleomargarine will remain in equilibrium in any portion of the liquid in which it is placed. Since oleomargarine is seldom sold pure, but is mixed with true butter to improve its taste and appearance, it may be practically most convenient to use alcohol of 55 per cent and consider as oleomargarine any so-called butter that will not sink to the bottom in it at 15° C. or 59° Fahr.

The theory has sometimes been set up in cases where arsenical poisoning is suspected, that the arsenic found in the subject may have been absorbed from bismuth taken for medicinal purposes. In view of this fact, Messrs. R. H. Chittenden and S. W. Lambert, of the Sheffield Laboratory, Yale College, have made experiments for the purpose of ascertaining the purity of bismuth subnitrate as regards arsenical poison, and whether, if arsenic is present, the poison taken in repeated doses of the bismuth is absorbed by the different organs and tissues of the body. Out of fourteen different samples of subnitrate of bismuth analyzed, only one was found to be absolutely free from arsenic, while the average content of arsenic in the samples examined was .013 per cent, or 13 milligrammes of arsenious oxide in 100 grammes of bismuth. This amount is equivalent to two tenths of a grain of arsenious oxide. Of one of the specimens 100 grammes contained 77 milligrammes, or 1.2 grain of arsenious oxide, or half a fatal dose of the poison. Although arsenic is known not to be an accumulative poison, but to be gradually eliminated from the healthy body when very small quantities are taken at periods somewhat remote from each other, there was still no evidence to show that even such small quantities as were present in the samples of bismuth might not be absorbed and give rise to an appreciable accumulation of the poison. In order to ascertain exactly to how great an extent it is absorbed and retained when arsenical bismuth is taken, a given quantity of bismuth subnitrate was administered to a large and healthy dog three times daily with his food, in increasing doses. This was continued for five weeks, when the dog was killed, twenty-four hours after the last dose was given. During the whole time he had taken a little more than a grain of arsenious oxide, and 2.38 milligrammes per day during the last three weeks. He was apparently unaffected by the bismuth. Only .00116 gramme of metallic arsenic was found in the stomach and intestines, with unweighable mirrors or minute stains in the other organs, and but little absorbed bismuth. It is concluded from these results that the greater part of the arsenic taken was not absorbed. The amount found in the alimentary canal was only one half the amount contained in the last three doses of bismuth taken, a portion of which remained in

the alimentary canal at the time of death. This, then, was not absorbed arsenic, but simply the amount contained in the bismuth still remaining in the alimentary canal. The unweighable mirrors found in the liver, brain, and blood were, however, evidence of slight absorption. The non-absorption of arsenic is probably dependent upon the form in which it exists in the bismuth—that is, upon its insolubility. The conclusion is drawn from the experiments that, while medicinal bismuth subnitrate contains a weighable quantity of arsenic, the poison was not present in the specimens experimented with, in a form capable of being readily absorbed into the system. This fact, however, does not diminish the need of a preparation of bismuth entirely free from arsenic.

M. Goppelsroeder has invented a method of what might be called dyeing by electricity, or of forming dye-stuffs by electrolysis. His process depends upon the decomposition of water in the galvanic battery, and upon the fact that coloring-matters may be produced by the oxidation of some substances and the deoxidation of others. To produce his dyes he dissolves organic matters, chiefly coal-tar products, which produce dyes by either action, in the acidulated water which is to be decomposed by the battery. As the same substance may sometimes give one color by oxidation and another by deoxidation, he separates the poles within the acidulated bath by interposing porous earthenware between them. The battery being put in action, the coloring substances which are derived by oxidation are produced in the oxygen end of the bath, those derived by reduction in the hydrogen end. With this process he has successfully produced aniline-black, different aniline-blues, Hoffmann's violet, artificial alizarine, etc.; and he exhibited at the Paris Exposition some fabrics beautifully colored with the dyes thus formed.

MM. Latour and Dubreuil have described a new process for extracting sulphur. The method commonly employed in Sicily is by roasting the mineral by piling it into tower-like heaps, and making fires at the bottom. The sulphur melts and is collected, but only half of it is secured, for the rest is lost in the atmosphere as sulphurous and sulphuric acids. The process can be carried on only during a part of the year, for the acid vapors destroy all vegetation during the growing season. The new method consists in throwing the mineral into boilers containing chloride of calcium. When the mixture is heated to 248°, the sulphur melts and sinks to the bottom of the boiler. As soon as the separation is completed the boiling liquid is poured off into another boiler, and is good to use again, without cooling. Extraction by this method secures nearly all of the sulphur, and can be carried on at all times, for it does not disengage any noxious gases.

M. E. Houdard has described a process and

apparatus for determining the sulphates contained in wines, by which as low a proportion as one half a gramme of sulphate per litre of wine can be ascertained. The process requires ten test-tubes placed in two parallel rows, five in each row; a pipette of 25 c.c. graduated in five divisions, each of 5 c.c.; a burette graduated in five divisions from 0.5 c.c. to 2.5 c.c., each division consequently containing 0.5 c.c. Five cubic centimetres of the wine to be tested are put into each of the test-tubes of the first row; Marty's standard liquid, 10 c.c. of which precipitate 0.1 gramme of potassium sulphate per litre, is then added, to the first tube 0.5 c.c., to the second 1.0 c.c., and so on, till the fifth tube receives 2.5 c.c. The contents of the five tubes are heated and filtered respectively into the five tubes of the second rank. It is then merely needful to add a drop of the standard liquid to each of the second set of tubes, and to notice in which tube it produces a faint turbidity. If, for instance, this turbidity appears in number 2 and not in number 3, it follows that the wine contains more than 2 grammes of potassium sulphate and less than 3 grammes.

Mr. Charles W. Folkard, in criticising the processes of analysis for the determination of organic matter in potable waters, notices, as a defect of them all, that since the products of the decomposition of the organic matter are the same as the normal constituents of rain, viz., carbonic acid, ammonia, and nitric acid, it is impossible to ascertain whether those substances were derived from contaminating bodies, or have been dissolved by the rain in falling. It is possible in the oxidation method to determine approximately the minimum amount of contamination which has taken place since the water was precipitated as rain, by deducting the average amount of nitrogen in water falling to the earth from the total amount found. But this affords no direct evidence as to the fitness of the water for dietetic purposes, because subsequent oxidation and fermentation may have rendered it to a great extent harmless. Regarding the subject in a biological aspect, the effect of mere dilution is hardly appreciable in disarming the germs of disease of their power. A single germ in a glass of water is competent to convey disease to a person sufficiently debilitated. It would be impossible to banish zymotic disease from towns the water of which contains the dejecta of persons suffering from the disease, even though in the most minute quantity. The very feeble would contract the complaint from the water, and from them it would spread to the robust around them. These germs are endowed with a most persistent vitality, and it appears that once-contaminated water is unsuited for dietetic purposes. Irrigation, chemical treatment, and filtration are alike powerless to effect a real purification of sewer-contaminated water. The only way to ascertain if a sample of water is fit for drinking pur-

poses is, in Mr. Folkard's opinion, to trace it to its source and see that contaminating matter has been excluded from the time that the water fell as rain till it entered the reservoir or the engine-well.

Dr. Edmund W. Davy, of the Royal College of Surgeons, Ireland, has applied a new and expeditious test for the determination of nitrites in water, which is based upon the reaction of nitrous acid or a soluble nitrite on gallic acid. When an aqueous solution of the latter acid is brought in contact with a soluble nitrite, the mixture, unless the amount of the latter substance present be very small, will soon acquire a yellow or yellowish-brown tint that will increase in depth up to a certain point, after which the color remains permanent, while at the same time minute globules of gas make their appearance in the mixture. If the quantity of nitrite present is exceedingly small, the reaction at the ordinary temperature will take some days, but may be made almost immediate by heating to the boiling-point. The depth or intensity of the color produced being in direct proportion to the amount of nitrite reacting on the gallic acid, the quantitative determination of the nitrites may be conveniently effected by comparing the color produced with that given by a standard solution containing a known quantity of nitrite. With this test, Dr. Davy has detected an amount of nitrite in water equivalent to one part of nitrous acid in twenty million parts of water. He is not prepared to say how much more delicate it may be. He considers it almost, if not quite as delicate, as Griess's test, and more convenient in many respects. The nitrates do not produce the reaction described, and do not affect the test, unless they are present in large quantities.

IMPROVED APPARATUS.—C. R. Tichborne, F. R. S., describes a new form of apparatus for estimating ammonia in potable waters. It consists of a retort fitting air-tight into a fairly long-necked receiver, with an India-rubber stopper. To the receiver is attached a bent tube proceeding from its stopper and connecting it with two bulb-tubes of a special form, somewhat similar to a flat Liebig's potash bulb, but with two pear-shaped bulbs on each side to prevent regurgitation of the fluid, and three absorption-bulbs at the bottom, the center one of which is provided with a glass tap. The whole apparatus having been connected, and the two bulbs filled with water free from ammonia, the water to be examined is poured into the retort and distilled over gently. After the distillation is completed the most of the ammonia, if not all, will be found in the receiver, while any vapor which may have escaped will be found in the first, and any atmospheric ammonia which may have entered by regurgitation, in the second bulb-tube.

Cross and Bevan's new apparatus for determining melting-points consists of a small strip of thin sheet-iron, having a hole at one end to admit the bulb of the thermometer, fitting it

closely, and a small indentation near the other end. A glass float is also made and attached to a piece of platinum wire bent at right angles. To make an observation, a small quantity of the substance is melted in the indentation of the plate, and while still liquid the platinum wire of the float is placed in it and allowed to become fixed by cooling. The plate is then attached to the thermometer, and the whole is heated in mercury till the float is liberated by the melting of the substance. The thermometer tells the temperature.

Andrews has described a simplified form of the air-thermometer of Crafts for determining temperatures above 350°C. The thermometer part consists of a capillary tube bent twice at right angles, on one end of which is a bulb of about one centimetre capacity, and on the other end a wider tube about fifteen centimetres long. At the point where the tube widens is a point of black glass to serve as an index, and in the middle of the wide tube is a glass cock. To the end of this wide tube is attached a rubber tube with two branches, one of which goes to a closed manometer and the other to a rubber bag. The bag, the manometer, and the wide tube are filled with mercury. To make an observation, the rubber bag is compressed till the mercury rises to the black glass index and the height of the mercury column in the manometer is noted. The thermometer is then exposed to the temperature to be measured, the column is again adjusted, and the new height noted. From these data and the constants of the instrument the temperature may be calculated.

M. D'Arsonval has invented an apparatus for uninterruptedly preparing oxygen without the agency of heat. It is based upon the mutual decomposition of peroxide of hydrogen and chromic acid. The apparatus is composed of two flasks, one containing clippings of binoxide of barium, the other bichromate of potassium dissolved in hydrochloric acid in excess. The two flasks are connected by an India-rubber tube, which also conveys the stream of chromic solution to the binoxide of barium. The hydrochloric acid in excess in contact with the binoxide produces peroxide of hydrogen, which, in contact with chromic acid, decomposes and causes the chromic acid to decompose. Thus a stream of oxygen is generated by two distinct decompositions, and is easily regulated by controlling the flow of the liquid.

Tommasi has described a simple apparatus, which he calls a *dissocioscope*, for showing the dissociation of ammoniacal salts. It consists of a tube of glass in which is suspended a slip of blue litmus-paper, previously moistened with a solution, completely saturated, and exactly neutral, of ammonium chloride. If the tube be plunged into a cylinder containing boiling water, the ammonium salt is dissociated and the blue litmus-paper becomes red. On placing it in cold water the dissociated ammonia and hydrogen chloride reunite, and the

paper becomes blue again. This may be repeated any number of times at pleasure.

VEGETABLE CHEMISTRY.—Dr. E. Ray Lankester controverts the assumption that chlorophyll, under the influence of sunlight, has the property of decomposing carbonic acid. The action never takes place except when living protoplasm is present in intimate association with the chlorophyll, and Dr. Lankester adduces a number of facts to show that it is really due to the protoplasm. Among them is the fact that the rays absorbed by the chlorophyll are not the most efficient ones in promoting the decomposition, while light that has traversed a solution of chlorophyll is still competent to excite the chemical process in question. The action of light, on the other hand, on the chemical motion of protoplasm is known to be very important, in that it promotes oxidation and the decomposition and disruption of the protoplasmic parts of the cell; and Pringsheim has suggested that the true function of chlorophyll is by its general absorbent action on light to protect the protoplasm of the cell from excessive oxidation, and especially the protoplasm of the chlorophyll corpuscles; while the protoplasm of these corpuscles, under the influence of the rays of light that pass the chlorophyll, decomposes carbonic acid and synthesizes starch. Dr. Lankester regards this explanation as reconciling the difficulties in the question. The fact, moreover, that in the organic world generally, the more complex chemical processes connected with nutrition and secretion appear to be carried on directly under the influence of the living substance of the cells, renders it probable on *a priori* grounds that the living protoplasm is the active agent.

M. Léon Bontroux, of Caen, has deduced from the examination of the ferments in fruits some facts that are interesting, though hardly conclusive, respecting their origin. Using Pasteur's method for ascertaining whether a body is charged with ferments, he introduced the body, after employing all necessary precautions, into a wine-must deprived of germs, which was then raised to a temperature of 86°. The foreign organisms that were developed with the ferments were then eliminated by methodic cultivation. Certain green fruits, including black currants, gooseberries, raspberries, and barberries, seemed to bear peculiar alcoholic ferments normally on their surface. Other fruits—like strawberries, cherries, and currants—did not exhibit them; but the most active ferments, those which produce wine, appeared suddenly on the ripe fruits. Seeking to find where the minute fungi that thus appear exist during the growing season, M. Bontroux discovered that they were borne in great abundance in nectariferous flowers, where the ferment grows at the expense of the saccharose of the nectar. This, then, is where the fungus lives during the spring and summer previous to the maturation of the fruit. The transfer-

ence of the ferment from the flower to the fruit remained to be accounted for. Thinking it might be due to the agency of insects, M. Bontroux examined the bees which frequented flowers in the nectar of which he had found the ferment-plants, and found the same kinds upon them. M. Bontroux explains the life-history of these organisms as follows: The ferments developed in flowers and fruits during the summer are preserved during the cold season, partly, perhaps, in the remains of plants, partly in the ground, and partly in the winter habitations of insects. In the spring, the germs that remain alive are borne by insects to the nectariferous flowers, where they are developed; in summer they are cultivated from flower to flower, being sown from one to another by insects that visit them, and are carried to ripe fruits by the same agency.

It has been in dispute whether plants absorb noxious substances which may be present in the soil, or have a capacity to discriminate against them. Freytag concluded, from experiments he made, that they have no discriminating power, but are compelled to take up whatever may be in the soil in a suitable form for assimilation. Liebig has advanced the same doctrine, but it has been contradicted by the results of experiments made by other observers. Mr. Francis C. Phillips publishes, in the "Journal of the Franklin Institute," the results of experiments which he made on this subject with selected plants, at Alleghany Park. His conclusions are, that healthy plants, grown under favorable circumstances, may absorb through their roots small quantities of lead, zinc, copper, and arsenic; that lead and zinc may enter the tissues in this way without causing any disturbance in the growth, nutrition, and functions of the plant, and that the compounds of copper and arsenic exert a distinctly poisonous influence, tending, when present in large quantity, to check the formation of roots, and either killing the plant or so far reducing its vitality as to interfere with nutrition and growth. Freytag and others have supposed that the absorption of poisonous metals causes no disturbance until a certain degree of concentration is reached, when the plant rapidly withers and dies; while others suppose that the plants absorb no such substances. The theory of Freytag seems to have the weight of facts in its favor, and if it is possible that crops may become charged in this way with poisonous elements of the soil, it becomes a matter of the highest importance that, wherever there is danger of such impregnation, the most efficient means be employed for averting it, for soil once impregnated with copper, lead, and zinc, may year after year bear crops poisoned in the same manner.

Ad. Mayer has reinvestigated the question of the capacity of the leaves of plants to assimilate ammonia. He found it to exist in the higher plants, but that the legumes, which are believed to gather considerable quantities

of nitrogen from the air, have no peculiar power in this respect. He infers that the practical significance of the capacity is very small. Experiments by Hässelbarth and Wein indicate that while nitrates are readily assimilated by plants, ammonia is taken up with difficulty, if at all.

The most noticeable recent experiments on the sources of the ash ingredients of plants are those of Grandean on the functions of the so-called *matière noire* of fertile soils, or the black inorganic matter, insoluble in water or acids, but soluble in alkalies, which can be extracted from the soil by ammonia. Notwithstanding it has been made probable that the organic matter in the soil does not contribute directly, to any appreciable extent, to growth of the plant, those soils which are distinguished for their fertility in general contain much humus, and soils deficient in organic matter are usually improved by adding humus to them. Grandean believes that the organic matter contributes to this property by acting as a solvent by means of which the inorganic salts in the soil are embodied in a peculiar compound with it, and are thus taken up and supplied to the roots of the plant in an assimilable shape, and has published the results of a number of experiments made by him with the *matière noire* of the Russian "black earth" and with other soils, in support of his view. Professor H. P. Armsby suggests that the humus acts through its decomposition, by supplying carbonic acid as a solvent for the rock-dust with which it is intermixed. Hence, if by any means the organic matter in the soil be increased, especially if it be finely divided and uniformly distributed, we have a considerable increase in the carbonic acid of the soil, and an increase in the rapidity of the solvent action which converts rock-dust into available plant-food. Add to this the solvent action of the acids formed by the decay of the organic matter, and the effect on the porosity, temperature, permeability, etc., of the soil, each in its turn reacting on the rate of weathering as well as on the growth of the crop, and we can readily see why humus should have a high value in the soil. Moreover, the natural organic matter of the soil is a consequence as well as a cause of fertility. A large amount of humus in a soil implies an abundant previous growth of vegetation, and this in its turn implies a soil of at least moderate original fertility.

It is agreed that the greater part of the carbon in plants is derived from the carbonic acid of the air; but the question has been much discussed whether a part of it may not be derived directly from the carbon matters contained in fertile soils. A few experiments by Van Tieghem and Blociszewski in the growth of embryos deprived of their endosperm in artificially-supplied albumen apparently confirmed the view that it might. Other experiments by Stutzer, in which it appeared that no growth took place when carboxyls only were present,

but that alcohol groups were required, indicated that in all the cases of apparent direct conversion carbonic acid was first found and became actually free in the soil before assimilation took place. Experiments with chlorophyll-free plants gave similar results. Stutzer's conclusions were confirmed by Schmöger, who did not, however, regard them as decisive. Experiments with such organic matters as are found in the soil have in general given negative results. Experiments by Böhm and Moll seemed to show that plants were incapable of producing starch when supplied with carbon only through their roots. Leaves were separated from starch and arranged with the basal end in an atmosphere containing carbonic acid, and the other end in an atmosphere free from it; no formation of starch could be detected in the part of the leaf deprived of carbonic acid, although it took place vigorously in the other end. These experiments, as well as the very similar ones of Cailletet, while they do not conclusively show that plants may not assimilate carbon from organic compounds, do show that under ordinary circumstances and in ordinary soils the amount of carbon which plants obtain through their roots is, at least, too small to be of any practical significance.

**ANIMAL CHEMISTRY.**—Recent experiments by Messrs. Chittenden and Griswold on the diastatic action of saliva under various conditions have revealed the fact that human mixed saliva in the presence of an equal volume of artificial gastric juice containing .05 per cent of hydrochloric acid is capable of forming, from a given quantity of starch, a much larger amount of sugar than the same quantity of saliva alone can do under a like degree of dilution; this being the more remarkable, when it is remembered that the same percentage of acid by itself greatly retards the diastatic action. This somewhat curious fact has led Mr. R. H. Chittenden, with Mr. J. S. Ely, to study the individual influence of several bodies of physiological importance on salivary fermentation. They directed their attention particularly to the inquiry whether many of the digestive processes in the body may not be more dependent for their fullest action on the stimulating or other influence caused by the mere presence of many of the digestive products, than has generally been supposed. Several of the products of digestion, it is true, when present in the digestive mixture in excess, have been found to retard the digestive process; but there are no facts to warrant the belief that the products of one digestive process necessarily hinder the action of some other allied ferment; for it is ordinarily understood that any accumulation of the digestive products simply hinders the action of their own particular ferment by clogging the digestive fluid. The results of their experiments show that peptones, a product of gastric digestion, exercise a decided influence on salivary digestion, stimulating the ferment to increased action, particularly in the

presence of acid which by itself completely prevents the conversion of starch into sugar.

The *ptomaines*, alkaloids produced by the decomposition of animal bodies, appear to have been discovered simultaneously and independently by M. A. Gautier, of France, and Professor Selmi, of Bologna. M. Gautier detected them in the course of chemical researches; Professor Selmi, while examining the fluids of a corpse in aid of a legal investigation. In the latter case, Professor Selmi detected the presence of an alkaloid that could not be identified with any body whose reaction was known, and confirmed his discovery by repeated experiments. Afterward he found, in the scrapings of the skeletons of subjects that had been buried for six and eleven months, fixed and crystallizable alkaloids possessing special chemical and physiological properties. Some of them were extracted by ether, others by chloroform or amyl alcohol; but, unfortunately, they were all yielded in extremely minute quantities. It is established by these experiments that an organic poison may always be found in an exhumed body, even when the person has not been poisoned. All bodies exhumed a month or two after death, all viscera preserved in bottles with or without alcohol, yield, when treated by Stass's method for the extraction of alkaloids, a certain quantity of ptomaines poisonous to animals that are made to take them. Although the existence and poisonous nature of the ptomaines have been proved, little has been determined concerning their chemical nature. Selmi has not isolated a pure ptomaine, nor has he made a salt or an analysis of them; he has only given their reactions. They are bodies of energetic reducing powers. With sulphuric acid they produce a violet-red color, and give out an agreeable odor like that of the hawthorn when heated. In the present state of our knowledge, we are not authorized to affirm that these alkaloids have produced poisoning until we shall have been able to isolate them and characterize them individually by the distinctive chemical reactions that are peculiar to them. The presence in a toxicological analysis of bodies presenting the general characters of the cyanic alkalies, and capable, like them, of causing the death of animals to which they are given experimentally, can not furnish a presumption of poisoning.

**INDUSTRIAL CHEMISTRY.**—A new industry has recently been established in the Landes of France, in the extraction and applications of the oils of the pine. Two kinds of oils are extracted from this tree: heavy oils employed for painting and the preservation of woods, and lighter oils for the purposes of illumination. *Pinoleum*, or the heavy oil of the pine, is obtained by distilling resinous woods at a low temperature. It is composed of essence of turpentine (85 per cent), metanaphthaline, resin-oil, phenic acid, creosote (40 per cent), and coal-tar, benzole, retene, etc. (25 per cent). It is valuable for the injection of

woods, and might advantageously take the place of the metallic salts generally employed for that purpose. It is also capable of being very serviceable in painting. The lighter oil for illumination is extracted directly from the wood by submitting it to distillation in special apparatus, and treating the product with chemical purifying agents. The oil thus prepared is of a light yellowish color, and may be used immediately. Belonging to the category of essential oils and being isomeric with the essence of turpentine, this oil has the same composition ( $C_{20}H_{32}$ ), and is distilled at the same temperature,  $300^{\circ}$  to  $340^{\circ}$ , but has the great advantage over turpentine of not forming resin and of not containing pinic or sylvic acid. It is wholly inexplosible, and is therefore perfectly safe as a light; and its light is one third brighter than that of petroleum, since it contains 88 per cent of carbon to 82 per cent in petroleum.

Professor Baeyer has communicated a favorable account of the progress which is making in the manufacture of artificial indigo at Ludwigshafen, and of the application of the dye to cloth-printing. A cheap cinnamic acid to serve as the base for the preparation is made directly by fusing benzyl chloride with acetate of soda, the operation being carried on in large boilers fitted with mechanical stirrers. The cinnamic acid is then treated, by hundred-weights at a time, with nitric acid and the substances required in the successive processes leading to the formation of propiolic acid. The last substance is precipitated from the solution of the soda salt by means of an acid, and, after washing, is sent to market as a paste. Artificial indigo is not itself manufactured at the works, but the coloring-matter is deposited by the printer in the fiber of the cloth from propiolic acid, as is aniline black from aniline. For this purpose a mixture of propiolic acid and xanthate of soda, to which a proper amount of thickening has been added, is printed on the cloth. The color makes its appearance on exposure to the air. It is found to be fast, and exhibits the characteristic tints of indigo in both light and dark shades. The processes of preparation and conversion, though long, work so well that the whole can be carried out with perfect ease. The only serious imperfection in the series is the loss of 40 per cent of cinnamic acid in the form of para-nitro-cinnamic ether. Professor Roscoe suggests that the difficulty arising from this source may possibly receive a solution from the recent researches of Otto Fischer on the synthesis of the rosaniline dyes by means of para-nitro-benzaldehyde, a body obtained by the limited oxidation of para-nitro-cinnamic acid. At the time Professor Baeyer visited the manufactory, 200 kilogrammes of propiolic acid paste, containing 25 per cent of the dry acid, were produced every day, and sold at the price of ten shillings per kilogramme.

M. Pechiney, of the chemical works at Se-

lindres, France, has made important improvements in the manufacture of the chlorates, whereby the loss of from 15 to 25 per cent of the total incurred in the manufacture of chlorate of potash by the ordinary method is reduced to one of below 5 per cent. In the method of preparation heretofore pursued, of treating milk of lime with chlorine and adding potassium chloride to the resulting "crude chlorate liquor," a mixture of two parts of potassium chlorate and about seven parts of calcium chloride is formed, from which it has been impossible to extract more than from 75 to 85 per cent of the chlorate of potash in any satisfactory state of purity. In this process the calcium chloride is separated by evaporating to a suitable degree of density, crystallizing by cooling to between  $10^{\circ}$  and  $12^{\circ}$  C., adding to the mother-liquor water and lime, and heating to determine the formation of oxychloride of lime, till only three tenths of an equivalent are left. The solution obtained, after the calcium chloride is separated, can now be made, by adding potassium chloride as before, to yield 95 per cent of the chlorate of potash in clear crystals. The solution of calcium chlorate obtained as above, treated with sodium sulphate, is made to yield chlorate of soda, and this is used with most excellent effect as an oxidizing agent in the process of dyeing aniline-black with the salts of vanadium, for the removal of the surplus aniline and the fixing of the color. M. Pechiney has also introduced a process for recovering sulphur from soda waste by injecting air into the "yellow liquor" till the right point of oxidation has been reached, and decomposing with hydrochloric acid. A precipitation of lime takes place during the process, and this facilitates the operation by rendering a less quantity of the acid necessary.

ANTISEPTICS.—Professor Barff has introduced a new antiseptic compound which is adapted to preserve food in a fresh state for any length of time, and appears to be superior to any other application for the purpose. It is called boro-glyceride, and is obtained by heating together boric acid and glycerine in the proportion of 62 parts of the former substance to 92 of the latter, when it is produced as a hard, ice-like substance. For use it is mixed with about fifty times its own weight of water. A gallon of the mixture, which costs less than an English shilling, will preserve as much meat as can be surrounded by it in any containing vessel. It can be used by untrained persons, and the same liquid may be employed over and over again. The quality of the work of this preservative was proved before the Society of Arts by the exhibition of articles that had been kept in it for several months, and were still perfectly fresh and retained their distinct natural flavors. Its innocuousness is proved by the fact that milk treated with it was used at a college near London, containing three hundred persons, during all

the summer months of 1881, without any one suspecting the presence of anything unusual.

Remarkable antiseptic properties have been discovered in peroxide of hydrogen by MM. Paul Bert and P. Regnard. It immediately and definitely arrests all fermentation due to an organized ferment, and kills the ferment, so that the fermentation does not recommence, even after the removal of the hydrogen peroxide by one of the substances that destroy it most rapidly. It also arrests the putrefaction of all substances which do not decompose it. At the same time, it has no effect on diastase fermentations, and the gastric and pancreatic fluids continue to act in solutions containing it. MM. Bert and Regnard further announce, as results of their investigations, that dilute hydrogen peroxide is not destroyed by fats, starches, soluble ferments, egg-albumen, casein, the peptones, creatine, creatinine, or urea; it is rapidly destroyed by nitrogenous collagens, by musculin, fibrin of the blood, and various nitrogenous vegetable matters; and that this action is definitely arrested by a temperature above 70 C. (140° Fahr.). Putrefaction, however, leaves the peroxide entirely intact. Acting upon the suggestions of these investigations, MM. Péan and Baldy, of the Hospital St. Louis, have used the peroxide as an antiseptic in surgery, with very successful results. They find that, when containing from two to six times its volume of oxygen, it appears to be capable of advantageously replacing alcohol and carbolic acid. It can be employed externally, for the dressing of wounds and ulcerations of all natures, in injections and in vaporization, and internally. Satisfactory results have been obtained from its use in old wounds as well as fresh ones; and the general as well as local state appears to be favorably influenced by it. It has the advantage over carbolic water, of being free from all poisonous effects and unpleasant odor, while its application is entirely painless. Peroxide of hydrogen for surgical use must be entirely neutral. That obtained in commerce contains a considerable quantity of sulphuric acid, and is therefore not wholly safe.

Dr. R. Koch having remarked that the only substances worthy of the name of disinfectants are chlorine, bromine, iodine, mercuric chloride, and perhaps potassium permanganate, and having particularly disputed the antiseptic properties of zinc chloride, Fr. Boillat calls attention to the fact that for a substance to be an antiseptic it is not necessary for it actually to destroy the germs. In the antiseptic treatment of wounds it would be impossible to employ such violently acting substances as those mentioned by Koch. All that is necessary is the presence of substances capable in some way of restraining the development of the germs, and such substances may from that fact properly be called antiseptics. Many antiseptics have the power of coagulating proteids. Among these is zinc chloride, and Boillat found

by experiments that coagula prepared with that substance required from thirty-one to forty-five days for bacteria to appear in them, while in serum, gelatine, and phenol albuminates prepared at the same time, the bacteria appeared in one or two days. Applied to the surface of a wound, zinc chloride forms a superficial coating of the neutral zinc albuminate, which affords no means for the bacteria to develop, and protects the parts under it.

**PETROLEUM-TESTS.**—Engler and Haas have thoroughly tested the different forms of apparatus in use for the determination of the flashing-point of petroleum, and find that all those are worthless in which the determination is made indirectly by measuring the tension of its vapor; because the tension of the vapor of petroleum and its inflammability stand in no simple relations to each other. Those tests in which the petroleum is heated in an open vessel have also been found to give unreliable results. Among these is the Saybolt tester, used in the United States, which gives results that are too high. Many of those testers in which the oil is heated in closed vessels were found to be constructed on false principles. The following principles have been laid down as those which ought to be kept in mind in testing petroleum, or in judging of the efficiency of the testing apparatus: The quantity of petroleum used in each case must be the same, and for each separate test a fresh portion must be taken. The heating must be uniform and slow, and the heating period should extend over 10°; while those oils whose flashing-point is but little above the temperature of the air should be cooled about 10° before heating. The intensity of the ignition flame and its distance from the surface of the oil must be the same in all the tests. If the size of this flame be increased and its distance from the oil be diminished, the flashing-point will be lowered. The ignition flame must never be so near the oil as to cause local vaporization, and for this reason its time of action should be reduced to a minimum. In general, the conditions for the formation of combustible gases in the testing apparatus should resemble as nearly as possible those which occur in lamps or in petroleum-stoves. Victor Meyer's method, in which a closed cylinder, one fifth filled with oil, is heated in a water-bath to a desired temperature, and is then taken out and shaken violently and tested with a gas-jet, was found to possess the advantages claimed by its author, and to give a fairly accurate test. Abel's test, adopted by the English and German Governments, employs an air-bath inclosed by a water-bath, to insure a slow heating of the oil, and may be tried and read at any time by merely opening the lid of the vessel. Its values are, however, regarded as too low. Skalneit has suggested that the specific gravity, the boiling-point, and the index of refraction of petroleum, be used in judging of its quality; but Engler and Haas have arrived at the con-

clusion, after experiment, that neither of these properties can be used as an accurate gauge. The best results were obtained with instruments made by the authors themselves, and provided with arrangements for exploding the vapor by means of an electric spark. The instruments of both are complicated, and require considerable skill on the part of the operator. Haas's apparatus is a clever modification of Victor Meyer's. Mr. Peter T. Austen, who also has investigated in this line, remarks that Meyer's and Haas's methods are both dependent for reliable results upon the interval of time that is allowed between the shaking, and objects to the necessity of repeating the shaking from degree to degree as an unpleasant feature of them. Liebermann's apparatus is free from these objections. In it a current of air is forced through the heated petroleum, so that it is charged with petroleum-vapor, and is tested from time to time with a lighted match or small flame. The apparatus has the recommendation of simplicity of construction and manipulation, and gives concordant results. Mr. Austen has adopted a modification of Liebermann's apparatus and method, in which the supply of air from a source of compressed air is regulated and controlled by a pinchcock on India-rubber tubing, so that a foam of about a half a centimetre is maintained on the surface of the oil, and the test is made from degree to degree by applying a small blow-pipe flame or a match. It is noteworthy that a slow continuous current of air gives a considerably higher flashing-point. The rapid current is effective by bringing the vapor to the mouth of the tube, and diluting it sufficiently to form an explosive mixture. In all the apparatus suggested by Meyer's principle the determinations are largely independent of the size or shape of the oil-holder, the quantity of oil, the means of ignition, the distance of the spark or flame from the surface of the oil, and the rapidity of the heating; and in Mr. Austen's application the determination of the flashing-point becomes as easy and trustworthy an operation as that of determining the boiling-point, while the results have a significance wholly wanting to those obtained by the older methods.

**ISOLATION OF CÆSIUM.**—The isolation of cæsium, hitherto unachieved on account of the extreme affinity of the metal for oxygen, has been effected by Carl Setterberg, by the electrolysis of a fused mixture of cæsium and barium cyanides. Thus prepared, it is a metal very similar to the other alkali metals, silver-white, very soft and ductile, having a melting-point of  $26.5^{\circ}$  C. ( $82^{\circ}$  Fahr.), and a specific gravity of 1.88. On exposure to the air it ignites spontaneously, and if thrown upon water it burns like potassium, sodium, and rubidium. Setterberg has proved anew that in consequence of the affinity of the metal for oxygen and the volatility of its salts, the preparation of cæsium by igniting its carbonate along with carbon—according to the ordinary method for

obtaining rubidium and potassium—is quite impossible.

**CHILI (REPÚBLICA DE CHILE).** To the general statements of area, territorial divisions, population, etc., given in preceding volumes, it may here be added that the population\* on January 1, 1880, has been reported at 2,183,434.

The President of the Republic is Señor Don Domingo Santa-Maria, inaugurated September 18, 1881, for the usual term of five years.

The Cabinet was composed, April, 1882, of the following ministers: Interior, Señor Don J. M. Balmaceda; Foreign Affairs and Colonization, Señor Don L. Aduante; Finance, Señor Don P. L. Cuadra; Justice, Public Worship, and Public Instruction, Señor Don J. E. Vergara; and War and the Navy, Señor Don C. Castellón.

The regular army comprised, in 1881, 10 generals, 21 colonels, 77 lieutenant-colonels, 103 majors, 191 captains, and 513 lieutenants, together 915 officers; ten battalions (9,040 men) foot, three regiments (1,296 men) horse, and two regiments (2,100 men) artillery; total strength of army, 12,436. The National Guard counts 20,400 men enlisted.

The navy in the same year embraced two iron-clad frigates, one monitor, two corvettes, two gunboats, six steamers, one sailing-frigate, three pontoons, and a number of smaller steamers—the whole equipped by 1,200 sailors.

Navy officers: one vice-admiral, four counter-admirals, eleven captains of ships-of-the-line, ten captains of frigates, twenty-two captains of corvettes, forty-five lieutenants, and forty-two enrolled cadets.

**FINANCES.**—The latest report of the Minister of Finance submitted to Congress renders an account of the actual workings of the Treasury in 1881. According to this document, the revenue of the republic in that year aggregated \$36,434,721, toward which income the custom-house contributed \$22,425,045; internal revenue (stamps, etc.), \$6,114,138; revenue from monopolies, \$2,549,376; the post-office, \$309,288; railroads, \$4,418,980; and sundries, \$617,891. This shows that the Government collected, in 1881, \$10,492,721 more than the preceding year. This excess of revenue resulted from an increased income from duties, war contributions paid by the enemy, guano, and railroads. On the other hand, less revenue was derived in 1881 from the mint, nitrate, and monopolies. The actual expenditure, part of which went toward covering deficiencies in 1880, was \$36,604,562. Of this amount only \$16,000,000 were spent to meet the requirements of the ordinary budget, the balance being absorbed by the war, the working of nitrate-of-soda deposits, etc.

During the first quarter of 1882 the ordinary revenue yielded \$17,537,181, and the extraordinary revenue \$1,291,857; it was estimated by the minister that the former would prove

\* See "Annual Cyclopædia" for 1879.

to have yielded in 1882 \$34,352,000, and the latter \$1,452,100. If to this there is added a balance that accrued to the Treasury from 1881, the minister calculates that the aggregate revenue for 1882 will have reached \$41,222,570, against a budget of outlays voted by Congress of \$25,562,838. But to this latter amount there will still have to be added about \$12,000,000 war expenditure and \$6,174,700 to be used in February and March, 1883, toward canceling bonds under the 1876 and 1877 loans falling due. On the other hand, the minister expects to save in the way of expenses \$4,000,000, which would enable him to transfer to the credit of 1883 \$1,500,000. For the latter year he estimates an income of \$36,462,000, and outlays to the amount of \$34,770,000. The total amount of bonds due that were to be paid off early in 1883 was \$10,000,000.

The foreign national debt of Chili amounted, in accordance with this officer's report, to \$34,870,000 on June 30, 1882; the home debt to \$56,546,584. The former involved at the time an annual payment of interest of \$1,944,237, and the latter of \$1,837,630. Add to this \$2,010,089 going toward the sinking fund, and \$1,500,000 loss in exchange (premium on the gold to be remitted to Europe for coupons), and it will be seen that Chilian expenditure under this head amounted to \$6,891,956 in 1882.

The report of the Minister of the Interior dwells on the tranquillity prevailing throughout the republic on the occasion of the transfer of powers when the new President took charge of the affairs of the country in 1881, as well as when the congressional and local elections took place. He mentions that several reform bills are submitted to Congress bearing on elections in the departments, and the rights of and protection to citizens, etc. Furthermore, Congress is urged to elaborate a law reforming the management of Government railroads, the administration of the latter at present being split into two distinct departments, in lieu of which it is proposed to substitute a central one.

**RAILROADS.**—The total length of these Government lines is at present 947 kilometres (equal to 597 miles), built at an aggregate cost of \$40,000,000. The net earnings of the Valparaíso-Santiago line have been, in 1881, \$948,896, being \$83,206 less than in 1880, but the Government has availed itself of the line for transporting troops, ammunition, etc., to the amount of \$217,567, which have to be added to the above earnings. There were forwarded 847,415 passengers against 662,185 in 1880; goods, 445,566 tons, being 3,742 tons in excess of 1880. The Southern Railroad shows net earnings \$894,445 greater than in 1880.

Congress sanctioned in 1882 the ensuing lines, and ordered the necessary surveys in consequence: Serena-Rivadavia; Quilpé-Santiago; Pelequen to Peumo; Parral to Canquenes; Coihue-Mulchen, and Robleria-Fort Victoria.

The Government recommends the building

of three additional lines, viz.: a branch line on the Central Railroad from Mapocho to the Condes mines; from Palmilla to Matanzas, and from Concepcion to Coronel, and a new tramway at Santiago. A number of new iron bridges were ordered to be built over various rivers at a total expenditure of \$268,697.

Total length of lines of railroads in operation early in 1881, 1,689 kilometres, or 1,064 miles.

**STATISTICS.**—The Chilian mails forwarded in 1881, altogether: 8,872,234 letters, being 588 more than in 1880; 19,142 sample packages, and 11,640,060 newspapers, being 656,623 more than the previous year. The post-office netted, in 1881, \$208,039, being \$24,922 in excess of the year preceding. Postal orders paid \$899,866.

To the 5,534 miles of telegraph in operation in Chili in 1881, there were to be added without delay 2,910 miles. The duplex system prevails on these lines. There were sent, in 1881, 287,476 messages, for which the sum of \$84,671 was collected, being \$51,466 more than the previous year. The Government forwarded and received 159,999 messages besides, paying for the same \$159,999, being \$90,281 more than in 1880.

The latest census statistics, those of 1881, show the populations of the principal cities, with the municipal expenditure set against each item: Santiago, 208,708 souls, city dues paid, \$1,174,882; Valparaíso and the suburb Viña del Mar, 96,558, \$620,754; Talca, 91,645, \$106,210; Copiapó, 32,659, \$105,916; and Rancagua, 18,334, \$103,898.

**COMMERCE.**—Trade statistics for 1881 show a notable increase of importation into Chili, as compared with the previous year. Thus, there were imported \$39,564,814 worth of merchandise and specie in 1881 (of the latter only \$433,692), against \$29,716,004 (the latter amount including \$29,427 specie) in 1880.

Chilian exports reached in 1880 only \$51,648,000; in 1881 they amounted, inclusive of specie and goods re-exported, to no less than \$60,525,859.

The increase of imports was: from England, 31 per cent; Germany, 54 per cent; France, 27 per cent; Peru, 121 per cent; the Argentine Republic, 39 per cent; and the United States, 5 per cent; the decrease from Spain was 55 per cent; Belgium, 37 per cent; and Paraguay, 89 per cent.

CHIEF IMPORTS.	1880.	1881.
From England .....	\$18,398,324	\$17,589,267
" Germany .....	4,785,642	7,885,870
" France .....	4,399,085	5,588,916
" Peru .....	1,113,726	2,905,049
" Argentine Republic .....	1,465,063	2,032,517
" United States .....	1,667,078	1,748,184

The principal articles of import from Chili into the United States are nitrate and wool. Of the former, there were received, in the fiscal year 1881, 28,941 tons; of wool, 1,852,721 pounds.

The leading European nations, on the other hand, take nearly all the copper, the bulk of the nitrate and wool, and all the wheat and barley shipped abroad by Chili, leading to an extensive trade by both direct steamship lines with some of those nations, and by sailing-vessels, thus reducing the freight rates, and rendering American competition extremely difficult in anything but specialties produced better and cheaper in the United States than elsewhere. Our heaviest export to Chili is made up of plain cotton fabrics.

The re-establishment of peace is not likely to produce much of change in this respect, but it will by degrees restore to us a valuable Peruvian trade.

The Chilean export movement in 1881 embraced the ensuing items:

Products of the mines.....	\$47,145,757
Agricultural products.....	9,967,780
Manufactures.....	107,593
Sundry other articles.....	262,801
Merchandise.....	\$57,483,931
Specie.....	1,582,277
Total.....	\$59,066,208
Re-exported merchandise.....	\$1,327,041
Specie.....	182,610
	1,459,651
Total.....	\$60,525,859

There has been a falling off, as compared with 1880, of \$1,000,000 in copper exportation, and \$2,000,000 in that of silver; but nitrate of soda has been rapidly on the increase since Chili occupied Tarapacá, and its export amounted, in 1881, to \$22,891,000.

EXPORT OF ALL KINDS OF COPPER FROM CHILI, DURING TWENTY YEARS, IN FINE COPPER, IN TONS OF 2,240 POUNDS.

YEAR.	YEAR.	YEAR.
1862..... 43,109	1869..... 54,867	1876..... 50,740
1863..... 32,540	1870..... 49,139	1877..... 45,490
1864..... 47,500	1871..... 41,200	1878..... 45,770
1865..... 45,927	1872..... 46,837	1879..... 49,890
1866..... 44,820	1873..... 42,165	1880..... 42,990
1867..... 44,654	1874..... 45,240	1881..... 37,500
1868..... 43,669	1875..... 45,430	

The decrease in the production of copper is due to the drafting of miners into the army. As soon as a treaty of peace between the belligerents shall have been signed, it is expected that Chili will be able to withdraw from Peru and Bolivia 20,000 of the 32,000 soldiers forming the present army of occupation, and that the output of the Chilean copper and silver mines will gradually recover from its recent comparative decline.

CHILIAN WHEAT EXPORTATION.

YEAR.	Tons.	YEAR.	Tons.
1872.....	373,400	1877.....	299,600
1873.....	459,900	1878.....	273,300
1874.....	356,800	1879.....	375,000
1875.....	839,100	1880.....	411,400
1876.....	845,000	1881.....	359,000
Total.....	1,929,200	Total.....	1,713,300

Scarcity of hands, through drafting into the army, and less abundant crops, have caused the falling off noticeable above.

As for the vicissitudes of the war in 1882,

we refer to the details given in this volume under "PERU." Negotiations for the re-establishment of peace, with and without mediation, both American and European, have followed each other in rapid succession without leading to any practical result. The retention of Tarapacá by Chili, the latter makes a condition *sine qua non*, the latest proposition in addition thereto on her part being that Tacna and Arica be given to Bolivia, so that the latter may form a barrier between the Chilean acquisition of Tarapacá, and Peru, and at the same time restore to Bolivia an outlet to the Pacific, which she possessed before the war, though of less magnitude and value than the one now proposed by Chili.

THE COUNTRY.—Count Eugene de Robiano, who traveled throughout the republic in 1882, has just published a book on Chili, entitled "Le Chili, l'Araucanie et le détroit de Magellan" (the house of Plon, Paris, publishers), in which we find the ensuing introductory passage: "Chili, together with Brazil, is of all South American countries the one whose progress has been most astonishing the last twenty years, and the state of civilization there reached places Chili in the first rank among those nations living at a great distance from us whose future seems safest."

The fertile plateau stretching through a great portion of Chili parallel with the coast, between the Cordilleras of the Andes and the coast-range of mountains, Count Robiano describes in about the following words: "This central valley, as may be supposed, varies a good deal in breadth, and does so to an equal extent as regards its products, which embrace mineral ores, cattle, vines, and cereals. Irrigation is, however, necessary, there being hardly any rain, but plenty of streams from the Cordilleras. Chili produces not only the cereals, etc., of Europe, but also tropical fruits. The climate is probably the most healthy on earth, while in point of minerals its deposits are almost inexhaustible."

The vigor and enterprise with which Chili pushes into the country of the semi-barbarous Araucanian Indians, one of its possessions, Count Robiano dwells on at great length, and so does a correspondence from Chili we find in the "Norddeutsche Allgemeine Zeitung." A passage from the latter reads about as follows: "Our readers are probably aware that of the eighteen provinces into which Chili is divided, the two southernmost—Valdivia and Llanquihue—have, since 1848, become prosperous German settlements. These two provinces are separated from the north of Chili by Araucania, a strip of land where hitherto the Pehuenches, a tribe of wild Indians, held exclusive sway. While Spain has, during three centuries, been unable to subdue these barbarians, Chili has not been more successful than the mother-country in this respect till within the past few years, for the Araucanians restricted their defense to a guer-

rilla warfare. For some years past the Araucanians have gradually been shut in by a circle of forts, which circle has gone on narrowing, and a railway has been pushed all the way to Angol, into the very heart of Araucania, a city founded only fifteen years since. Now the territory makes good agricultural headway, so that wheat and wine are for some years past exported from there on an extended scale. Two passes, or 'boquetes,' across the Andes, however, remain open, and thence the Araucanian and Argentine Pampa Indians occasionally make raids into that portion of Chili. An expedition has been set on foot from Angol for the purpose of building forts at the entrance of the 'boquetes' named, and the Government has proposed to Congress the construction of a railroad from Angol to Valdivia. This matter is to be pushed through without delay. The railroad will run all the way through the center of the valley situate between the Cordilleras and the coast-range from Valparaiso in a southerly direction, with three intersecting lines at suitable distances to connect the Cordilleras with the seaports that may be selected. This entire railway is to be built out of a \$6,000,000 surplus which the republic will have at its disposal early this year after paying off \$10,000,000 of the public debt. As soon as 20,000 men of the army of occupation return, after peace shall have been concluded, prosperity in Chili will make still more extraordinary strides."

CHINA, an autocratic empire in Asia, embracing the eighteen provinces of China proper, the province of Liantung outside the wall, the dependencies of Mantchooria, Mongolia, and Thibet, and the vassal kingdom of Corea, and possessing undefined suzerain powers over the kingdoms of the Malay Peninsula. Tsait'ien, the present Emperor, is a child, born in 1871, who succeeded to the throne by proclamation on the demise of T'oung-che in 1875, who died in his eighteenth year without appointing his successor. The proclamation was the result of an intrigue of the Empress Regent, widow of the Emperor Hienfung, and Prince Ch'un, his brother and Tsait'ien's father. Tsait'ien is the ninth Emperor in the Tartar line of Tsing, which succeeded the native dynasty of Ming in 1644. The government is regulated by the principles laid down in the book of Ta-tsing-hwei-tien and the writings of Confucius. The administration is directed by the Interior Council Chamber, consisting of four members, two of Tartar and two of Chinese origin, with two religious and legal advisers who see that their acts conform to the fundamental laws. There are under them six boards, each presided over by a Tartar and a Chinese: the board of civil appointments; of revenues, or finances; of rites and ceremonies; of the army; of public works; of criminal jurisdiction.

AREA AND POPULATION.—The area and population of the eighteen provinces are officially returned as follow:

PROVINCES.	Area : English square miles.	Population.	Population per square mile.
Chihli.....	53,949	27,990,871	475
Shantung.....	65,104	28,958,764	444
Shansi.....	55,268	14,004,210	253
Honan.....	65,104	28,037,171	354
Kiangsu.....	44,500	37,548,501	850
Anhui.....	48,461	34,168,059	705
Kiangsi.....	72,176	23,046,999	320
Chékiang.....	39,150	26,256,784	671
Fukien.....	53,480	14,777,410	276
Hupéi.....	70,450	27,870,098	389
Hunan.....	84,000	18,652,507	223
Shensi.....	67,400	10,807,256	162
Kansuh.....	86,608	15,198,125	175
Szechuen.....	166,800	21,435,673	128
Kwangtung.....	79,456	19,174,080	241
Kwangsi.....	73,250	7,813,895	98
Kweichow.....	64,554	5,288,219	82
Yunnan.....	107,969	5,561,320	51
Shéngking.....	227,274	2,167,286	10
Total.....	1,534,953	362,447,183	286

These returns are probably excessive. The population was formerly greater, being returned in 1840 as 414,686,994, or 320 to the square mile, and in 1852 as high as 450,000,000, or 347 to the square mile. Intestine wars and famines have since reduced the population to probably not more than 300,000,000. The extent of the outlying provinces and dependencies can be only vaguely determined, as their population and area are a matter of estimate, and the limits of the actual rule of the Chinese Government are shifting and uncertain. According to estimates of the missionaries the total area and population of the Chinese Empire are as follow:

DIVISIONS.	Area.	Population.
	Eng. sq. miles.

Corea.....	90,800	8,000,000
Liantung.....	2,982	1,000,000
Total.....	3,922,817	382,447,183

The foreign population was returned in 1879 as 3,995, the majority residing at Shanghai. The number of British was 2,070; of Americans, 469; of Germans, 364; of French, 225.

MILITARY.—There are two distinct bodies of soldiery—1. The Mantchoo, Mongol, and Chinese Bannermen, distributed in permanent garrisons in the great cities, and representing the army with which the Mantchoo Tartars conquered and occupied China in 1644; and, 2. The native Chinese army, stationed in a great number of commands, each capable of mustering from 20,000 to 100,000 men in time of war, and performing police duties in time of peace. The foundation of a modern navy was first laid by the purchase of some ironclad gunboats in 1877. An ironclad man-of-war was completed in Germany in 1881.

FINANCES.—The public revenues, derived from land, grain, and license taxes, and from import and export duties, are estimated to be

about \$125,000,000 a year. The customs receipts only are published. These increased from 7,872,257 Haikwan taels (the Haikwan tael = \$1.50) in 1864 to 12,483,988 in 1878. The largest receipts are from export customs. The army consumes about \$75,000,000 of the revenues. There is a small public debt paying eight per cent interest, contracted abroad in two loans, one of \$3,138,375 in 1874, the other of \$8,021,380 in 1878.

COMMERCE.—The total imports in 1880 amounted to \$118,940,000, and the exports to \$116,825,000. In ten years the imports had increased 19 and the exports 27 per cent. There are twenty-two ports opened to foreign commerce since 1854 by treaty, although one of them, Nanking, has not been thrown open. The largest share of the foreign trade is with Great Britain, which received from China in 1880 146,081,679 pounds of tea, valued at £7,701,804, and £2,650,085 worth of raw silk, and imported into China £3,498,684 worth of cotton manufactures, £867,420 of woollens, and £698,201 of other goods, besides £3,778,201 of imports, mostly cotton manufactures, imported through Hong-Kong. The progress of China in adopting Western arts and commercial methods is retarded by the abuses of the system of Chinese officialism, as well as by the conservative prejudices of the people. The patronage of powerful mandarins is required to protect every novel enterprise of importance, and this is only to be obtained by sharing the profits with the patrons. The oldest undertaking of the kind, the China Merchants' Steam Navigation Company, has prospered in the end through the interest and support of Li Hung Chang. The company started in 1872 with two small steamers purchased at exorbitant prices from an English corporation. A subsidy in the form of liberal freights on the rice sent to the Mantchoo garrisons in Peking enabled them to compete successfully with the foreign vessels for the coasting-trade. They purchased other vessels, and in 1877 bought out the Shanghai steamship line with borrowed money, part of it advanced by the Government. The company was enabled to pay interest by the subsidies, but could not have long continued in existence, as the debts far exceeded the value of the vessels. The share capital stood at 751,000 taels and the borrowed capital at 3,800,000 taels in 1878. A reform in the management was instituted. The officials and their friends who had obtained places in return for the Government loans were dismissed, and their peculations stopped. This with the revival in trade has enabled the directors in three years to reduce the debt, lower the capitalization to something like the value of the fleet, and report a net profit of 21 instead of 7 or 8 per cent on the capital employed. The share capital was given in 1881 as 1,000,000, and the borrowed capital as 2,600,000 taels, 1,500,000 of which were Government loan. In addition to their coast-

ing business, the company has attempted to run packets to San Francisco and tea-ships to London. A Russian and Danish company completed a telegraph line from Shanghai to Tientsin at the end of 1881. The enormous coal deposits which are scattered all over the eighteen provinces have only been begun to be worked. In Formosa the Government started mines in 1876, employing an English engineer. The works were not commercially successful at first; yet the output increased from 14,000 tons in 1878 to 30,000 tons in the first six months of 1881. The coal sells at \$2.50 a ton, the cost of mining being only \$1.34; but embarkation is difficult. At Kaiping, near Tientsin in North China, a private company, encouraged by Li-Hung-Chang, is working rich beds, four to six feet thick. A woolen factory established in Lan Chowfoo, in the remote province of Kansuh, with public means by Tso-Tsung-t'ang, produces cloth very cheaply, though the quality of the wool thus far received is inferior.

AGRICULTURE.—In the vast territory of the Celestial Empire some district is stricken with famine nearly every year by drought, floods, or locusts, if not in consequence of an insurrection. In 1882 a rise of the Yangtse and its tributaries, caused by a heavy rain-fall coming at the time of the melting of the snows in Central Asia, overflowed large tracts of rice-land. The cultivators of China are extremely poor, never accumulating capital. This may be owing to the land laws, although they correspond to some of the advanced ideas of modern agrarian theorists. All waste lands belong to the crown, but whoever brings them under tillage acquires a clear title, and can freely sell the property. The property of a decedent passes to his male children in equal shares, and can not be bequeathed away from them. The greater part of the soil is owned in small parcels, or from five acres down to a sixth of an acre. The possessor of ten acres is considered well-to-do, and the owner of an estate of a thousand acres is accounted a millionaire. Over two thirds of the land is cultivated by tenants on the *métayer*, or half-profit system; the landlord providing the houses and paying the tax, which amounts to 10 per cent of the net returns, and the cultivator the simple implements besides his labor. One bad season reduces these tenants to beggary.

EVENTS OF THE YEAR.—The most important events to chronicle are the removal of the prejudices and the obstacles connected with the official system to the introduction of the material improvements of European civilization. The Kaiping coal-mining operations were nearly stopped in compliance with a memorial of one of the censors representing that they offended the protecting dragon of the district, and disturbed the *manes* of the lately deceased Empress, who is buried some sixty miles distant. It was only by bribery that these superstitious objections were overcome.

The enlightened Prime Minister, Li-Hung-Chang, upon the death of his mother, petitioned, in obedience to custom, to be relieved of his offices during the long period of mourning prescribed, taking the precaution to secure as his deputy a man in sympathy with his projects, Chang-Shu-Sheng, Governor-General of Canton. His request was at first refused, but he was finally relieved of his duties as Secretary of State and Governor of the Metropolitan Province, but retained as Imperial Commissioner of Commerce, and commander of the forces at Tientsin. Three daily newspapers are printed at Shanghai; the oldest, the "Shên-Pao," has a circulation of 10,000. The Rev. Mr. Allen, an American missionary, has founded a university at Shanghai. The cause of progress receives its chief support from Chinese merchants who have acquired wealth in foreign trade, already a numerous and powerful class. A new decorative order has been created for bestowal on foreigners of distinction who have rendered services to China; it is called the Order of the Double Dragon. (For legislation prohibiting Chinese immigration into the United States, see CONGRESS, UNITED STATES, and IMMIGRATION, CHINESE.)

**CHRISTIAN CONNECTION.** The statistics of the Christian Connection are very imperfectly reported, and no attempt has been made to compile them in tabular form for several years. The Connection has sixty annual or local conferences, ten of which are in New England and Canada, ten in the Middle States, and forty in the Southwestern and Western States, and includes, according to the most recent estimates, about one hundred and fifty thousand members. A kindred organization in the Southern States, called the Christian Church, originated in a separation from this body in 1854, which was provoked by the action of the General Convention on the question of slavery. The Rev. J. W. Wellons, a fraternal delegate from this body to the recent Quadrennial Convention, stated there that it numbered about twenty thousand white and five thousand colored members.

The Christian Connection does not assume any denominational name, but adopts the term Christian in a general sense simply to indicate that it makes a Christian profession. It accepts the Bible as its only rule of faith and practice, granting to every man the right of individual judgment, and professes fellowship with, and admits to its communion, all Christians, without regard to their theological opinions or their views or practices in ordinances. It has always encouraged preaching by women, and welcomes them to all the privileges of the church. Its government is stated by the editor of its official newspaper organ to be "neither Congregational, Presbyterian, nor Episcopalian. It is neither a democracy, an aristocracy, nor an autocracy, but a brotherhood with one only Master, even Christ, to whom each individual shall answer for himself."

**MEETING OF THE QUADRENNIAL CONVENTION.**—The Ninth Quadrennial Session of the Christian Convention of the United States and Canada was held in Albany, N. Y., beginning October 4th. The Rev. Asa W. Coan presided. The Sunday-school secretary reported concerning 875 Sunday-schools, with 52,000 members. The financial secretary reported that \$25,000 a year were needed for the several branches of denominational work. The publishing agent reported a net gain by the Publishing House at Dayton, Ohio, during four years, besides paying interest on its debts, of \$2,286. A weekly general religious newspaper and three Sunday-school papers were published at the establishment. The general weekly paper, the "Herald of Gospel Liberty," was originally started in Portsmouth, N. H., in September, 1808, and was the first religious periodical in newspaper form ever published. Outside of the Publishing House were published the "Christian Gem," at Suffolk, Va., as the organ of the Christian Church of the South, and the "Christian Indicator," at Kokomo, Ind. Reports were made of the condition of the educational institutions of the Connection, including Starkey Seminary, Eddytown, N. Y.; Antioch College, Yellow Springs, Ohio; the Christian Biblical Institute, Stanfordville, N. Y.; the Franklinton School, Franklinton, N. C.; Le Grand Institute, Iowa; and Union Christian College, Merom, Ind. Resolutions were adopted in favor of total abstinence from the use of intoxicating drinks, and prohibition of the traffic in them. Secretaries were elected for missions and church extension. Fraternal delegates were present from the Christian Church of the South; and six fraternal delegates were appointed to represent the Convention at the next meeting of the Southern Convention.

**CIVIL RIGHTS CASES.** (See LAW, CONSTITUTIONAL.)

**CLAY, CLEMENT CLAIRBORNE**, born in Madison County, Alabama, 1819; died near Huntsville, Ala., January 3, 1882. Mr. Clay graduated at the University of Alabama with honor at the age of sixteen. He was endowed by nature with more than ordinary intellectual abilities, and even when he was quite young was not unmindful of the obligations they imposed. When his father was elected Governor of Alabama, he appointed his son private secretary. He did not, however, forsake his books, but continued adding to the stores of a retentive memory, at the same time contributing editorials to the leading journals of Alabama. After his father was elected to the Senate of the United States, Mr. Clay went to the University of Virginia, and completed his legal studies. Returning to Huntsville, Ala., he commenced a successful practice of law. Soon his fellow-citizens insisted upon electing him as their Representative to the State Legislature, in which he served in 1842, '44, and '45. In 1846 the Legislature elected him Judge of the Madison County Court, where he presided un-

til 1848, when he resigned, to resume his practice. In 1853 he was elected to the United States Senate from Alabama. As a Senator he regarded himself as the envoy of a sovereign State to the council of the nation, and lost no opportunity of asserting the rights of that State as defined by Mr. Calhoun and other Southern statesmen. His course in the Senate was fully approved by his constituents, and in 1857 he was re-elected for a second term of six years by a unanimous vote of the Legislature. Returning with this unqualified indorsement, he renewed his efforts in behalf of his State, and was among the boldest champions of State rights.

When the invasion of these rights was commenced with military force, as viewed by the Southern States, and the Confederate States Government was sorely pressed by its assailants, Mr. Clay, who had been a member of the Confederate Congress, was selected by President Davis as an agent for the purpose of performing some important secret service, in connection with Jacob Thompson, on the Northern frontier of the United States. In May, 1865, at the close of the war, a reward was offered by President Johnson for the arrest of Mr. Clay, hearing of which he came forward and surrendered to the United States officer commanding at Macon, Georgia. He was shortly afterward taken as a prisoner to Fortress Monroe, and assigned a casement on the same floor with the late President Davis. Mr. Clay was detained at Fortress Monroe until April, 1866, when he was released on his parole, by the conditions of which he was allowed to go anywhere in the United States on private business, but was to make the State of Alabama his residence, and hold himself in readiness to obey at any time any summons made upon him by the Government of the United States.

COAL, BITUMINOUS, PRODUCTION OF, IN THE UNITED STATES, DURING THE YEAR ENDING JUNE 1, 1880.

I. The census returns give statistics drawn from eighteen States east of the one hundredth meridian, viz., Alabama, Arkansas, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Michigan, Missouri, Nebraska, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia. Three hundred and fourteen counties are specified, of which forty-nine are in Kentucky, forty-six in Illinois, thirty-five in Missouri, thirty in Ohio, twenty-nine in Pennsylvania, and twenty-eight in West Virginia.

1. Number of establishments, 2,943, of which Pennsylvania, Ohio, and Illinois furnish the largest number (Pennsylvania, 666; Ohio, 618; Illinois, 590=1,874).

2. Capital employed and invested in establishments, \$90,000,000, of which Pennsylvania furnishes nearly \$40,000,000. Irregular workings are rated at about \$3,500,000.

3. Total product, 40,940,028 tons, of which Pennsylvania yields 18,425,163 tons, Illinois and Ohio over 6,000,000 tons each.

4. Value of total product at mines, \$49,733,603, of which Pennsylvania obtains \$18,567,129, Illinois nearly \$9,000,000, and Ohio nearly \$8,000,000.

5. Total number of men and boys employed, 96,475: of these Pennsylvania employs 33,248; Ohio, 16,331; and Illinois, 17,307. The working-time is here taken to consist of twelve months, of twenty-five working days each.

6. Wages paid to all classes of labor, \$30,707,059, of which Pennsylvania pays nearly \$11,000,000; and Ohio and Illinois \$5,000,000 and \$6,000,000 each.

7. Steam-engines used, 812. Value of these and other machinery, \$2,403,211.

8. Value of real estate, \$90,000,000: in Pennsylvania, \$27,152,403; Maryland, \$11,387,000; Ohio, \$8,529,931; Illinois, \$6,100,460; and West Virginia, \$3,597,259.

9. Acres of available coal-lands attached to working establishments, 410,642: being, in Pennsylvania, 118,311; in Ohio, 58,639; in Illinois, 55,061; in West Virginia, 46,659; in Kentucky, 34,635; in Tennessee, 23,743.

10. Tons raised yearly per man, on average, 431.53. Maryland gives the largest, 651.23; Pennsylvania next, 560.14; Tennessee, 487.90; West Virginia, 407.82; Illinois, 385.64; Ohio, 373.03.

As between the bituminous coal industry and the iron-ore mining industry, the former takes from the earth a product worth 140 per cent more, employs 205 per cent more hands and 46 per cent more capital, uses 161 per cent more materials, and pays 222 per cent more wages. The increase in the tonnage of the iron-ore mined during the census year is 136 per cent, and in that of bituminous coal 135 per cent, as compared with the census year of 1870; showing that these two great divisions of mineral production keep pace with each other, and are advancing nearly twice as fast as the production of anthracite. The reason of this is the obvious one that in the former cases new fields are laid under contribution, from time to time, as railroads are extended, whereas anthracite is restricted to its original area. Iron is mined in 135 counties, and bituminous coal in 314 counties, east of the one hundredth meridian.

II. Production of bituminous coal and lignite west of the one hundredth meridian. Twenty counties are specified in the States of California, Colorado, and Oregon, and in the Territories of Montana, Washington, and Wyoming.

1. Number of establishments, 46; of these, 25 are in Colorado.

2. Capital employed and invested, \$8,479,573; nearly \$6,000,000 is in Colorado, and \$1,240,000 in California.

3. Total product, 1,477,736 tons, of which Wyoming Territory (four counties, six establishments) yields nearly 590,000 tons, and Colorado, 463,000 tons.

4. Value of total product, \$3,272,470; of

which Wyoming Territory obtains \$1,080,451, and Colorado \$1,041,250.

5. Total number of men and boys employed, 3,441; of these, 1,434 are in Colorado, and 1,000 in Wyoming Territory.

6. Wages paid to all classes, \$1,828,401.

7. Steam-engines used, 42; of these, 20 are in Colorado.

8. Value of real estate, \$6,858,300; of this, \$5,448,100 are credited to Colorado.

9. Acres of coal-land, 33,000; 23,592 being in Colorado.

III. Production of coal in the United States for the year ending June 1, 1880, by coal-fields (tons of 2,000 pounds):

1. BITUMINOUS:	
Appalachian field .....	29,842,240
Western field (Illinois, Indiana, etc.) .....	8,721,101
Michigan field .....	100,800
Triassic field (Virginia and North Carolina) .....	46,246
Iowa and Kansas field .....	2,282,458
All fields west of the one hundredth meridian .....	1,477,786
Total bituminous .....	42,420,581
2. ANTHRACITE:	
Pennsylvania .....	23,640,519
Rhode Island .....	6,176
Total anthracite .....	23,646,695
Grand total coal production .....	71,067,576
Grand total of hands employed .....	170,585

In this connection it may be noted that the production of coal in England was, in 1855, 64,661,401 tons, in 1877 it was 136,179,968 tons, and in 1880 it was 146,818,122 tons. The number of collieries in 1880 was, in England, 3,880, and in the United States 3,264.

#### COAL-MINING WITH CAUSTIC LIME.

A new method of bringing down coal, in which quicklime takes the place of explosives, has proved a success in English coal-mines. The lime is obtained in a strongly caustic state from mountain limestone. It is first ground to the finest powder, and then pressed into compact cakes by a pressure of forty tons. The cakes are of the form of cartridges, two and a half inches in diameter, with a groove along the side. The hydraulic press, specially designed for compressing the cartridges, can be erected at a moderate cost in any colliery. The cartridges are ready for use after coming out of the press, but until they are needed they must be kept in air-tight boxes, to preserve them from damp. The drill-holes are made with a light boring-machine, and an iron tube, about half an inch in diameter, is inserted in the hole along its whole length. The tube is provided with a groove along the outside with perforations. A bag of calico covers the perforations and one end of the tube, and has a tap fitted on at the other end. The cartridges are lightly rammed, so as to insure their filling the bore-hole. They are inclosed with tamping in the same manner as a gunpowder-charge. The charge is then ready for blasting. This is accomplished by connecting the tap at the end of the iron pipe with a small force-pump by means of a flexible tube, and forcing in a quantity of water equal in bulk to the quantity of

lime in the tube. The water is driven to the lower end of the shot-hole through the tube, and escapes along the groove through the perforations and the calico, saturating the lime and driving out the air. The tap is closed, to prevent the escape of the steam generated by the action of the water on the lime. There is an interval after the introduction of the water before the steam attains a high pressure, so that all danger can be avoided. The action of the steam cracks the coal away from the roof. The sprags are left in under the coal, so as to allow the fissures to extend as far as possible. In many cases the coal is broken away for a distance of several inches beyond the end of the drilled holes. The expansive force of the steam generated by the usual charge of seven cartridges is about 2,850 pounds. The expansion of the lime takes place subsequently. Its effect may be measured by comparing the bulk of a quantity of lime equal to that used in the cartridges before and after slaking. The action is over in from ten to fifteen minutes. When the sprags, or props, are then removed, the coal falls from the roof in large masses, leaving a clean surface. The waste in dust and small coal is much less than when powder is used for blasting, being only about six per cent. For economy, thoroughness, avoidance of smoke, etc., the new process offers many advantages over gunpowder-blasting; but its greatest merit consists in averting the danger of explosions from the ignition of gas by the blast.

COLOMBIA (ESTADOS UNIDOS DE COLOMBIA). For statistics relating to area, territorial division, population, etc., see "Annual Cyclopædia" for 1877. The Executive of the confederacy, President F. Zaldua, inaugurated April 1, 1882, died later in the year, and the Federal Congress at Bogotá appointed Messrs. Otalora, Aldana, and Hurtado to exercise jointly the Federal executive power as "Designados" to the end of the presidential term. The Cabinet was composed of the following Ministers: Secretary of State and head of the War Department, Señor B. Noguera; Public Instruction, Señor J. M. Campas; Interior, Señor J. de J. Alirar; Finance, Señor M. Samper; Treasury, Señor N. Borrero; Foreign Affairs, Señor J. M. Suijano Wallis; and Public Works and Post-Offices, Señor F. F. Paul.

The chief magistrates of the nine States were as follow:

Antioquia, Señor Lucien Restrepo; Bolívar, Señor Benjamin Noguera; Boyacá, Señor Aristides Calderon; Cauca, Señor Ezequiel Hurtado; Cundinamarca, Señor Daniel Aldana; Magdalena, Señor José María Campo Serrano; Panamá, Señor Rafael Nuñez; Santander, Señor Solon Wilches; Tolima, Señor Marcelo Barrios. Each of the foregoing functionaries has the title of president, except those of Cundinamarca and Tolima, who are styled governors.

The United States Minister Plenipotentiary to Colombia is General Manney (accredited September 21, 1881), and the United States

Consuls at Bogotá and the chief Colombian seaports respectively are: Barranquilla, W. W. Randall; Bogotá, B. Koppel; Carthagena, E. W. P. Smith; Colon, J. Thorington; Panamá, J. M. Wilson; and Riohacha, N. Daniels.

The regulation strength of the army in time of peace is 2,000, and in time of war each of the nine States is required to furnish a contingent of one per cent of its population.

The revenue and expenditure of the republic for the fiscal year, 1882-'83, were officially reported at \$6,327,540 and \$9,097,549, thus showing a deficit of \$2,770,009. The previous budget had been: 1881-'82—income, \$5,917,000; outlays, \$9,529,547; showing a deficiency of \$3,612,547.

The national debt was reported as follows, on August 31, 1881:

Foreign debt.....	\$9,570,500
Home debt.....	10,886,278
Total.....	\$19,956,778

The foreign trade of the republic by land and sea was as follows:

	Imports.	Exports.
1880-'81.....	\$12,071,480	\$15,536,900
1879-'80.....	10,387,008	13,804,981
1878-'79.....	10,787,654	13,711,511
1877-'78.....	8,798,797	11,111,197

In 1879-'80 the exports were distributed as follows: To the United States, \$4,565,200; to England, \$4,326,200; to France, \$1,971,000; to Germany, \$1,648,000; and to other countries, \$1,294,581; together, \$13,804,981.

The following articles constituted this export movement: Quinine-bark, \$3,229,000; coffee, \$3,051,000; leaf-tobacco, \$1,284,000; hides, \$1,009,000; cattle, \$528,000; India-rubber, \$355,000; vegetable ivory (*táqua*), \$285,000; cabinet and dye woods, \$133,000; gold and silver bullion, \$2,765,000; gold and silver ores, \$515,000.

One of the most valuable products of Colombia, quinine-bark, or cinchona, is being rapidly exhausted there as well as in Peru, and its culture has therefore been successfully introduced into Ceylon and Java. We may be permitted to add, with reference to this important drug, a passage we take from Cassell's "New Popular Educator": The discovery of the medical properties of cinchona-bark is enveloped in great obscurity. All that we know about it for certain is this: Before the year 1638—that is to say, one hundred and fifty years subsequent to the discovery of America—not even the Spaniards were acquainted with the febrifuge qualities of cinchona-bark; but in this year, or thereabout, the Countess de Chinchon, the wife of the Spanish Viceroy of Peru, was cured of a violent intermittent fever by drinking an infusion of the bark, and this led to its introduction into Europe. Were the natives themselves acquainted with it? Humboldt answers this question very positively in the negative, and refers the discovery to the

Jesuit missionaries, who, being in the habit of tasting the bark of every tree they hewed down, at length discovered the precious febrifuge. Other authors of repute contend that the virtues of cinchona-bark were known to the Indians long before the advent of the Spaniards; but the question again arises how they first became acquainted with its properties. To account for this, the ridiculous tale has been invented that certain animals, while laboring under fever, happened to gnaw the bark of one of the cinchona-trees, and were cured forthwith. Far more probable is it that some cinchona-trees having been laid prostrate by the tempests in a pool of water, and the latter becoming charged with the medicinal principle, some person laboring under fever drank of this water, was cured, and published the result. But, however this may be, it is certain that the remedy first became popularized in Europe through the agency of Count de Chinchon, Viceroy of Peru, whose wife, as we have said, was cured of intermittent fever by its administration. The new remedy, however, was badly received in France and Italy. The faculty set their faces against it. Physicians who dared prescribe its use were persecuted, and it was only the patronage of Louis XIV which ultimately rendered it popular in France. This monarch, suffering from intermittent fever, was cured by an English empiric named Talbot, by means of a secret remedy. This was no other than cinchona-bark. Louis XIV purchased the secret for the sum of 48,000 livres, and bestowed yearly a pension of 2,000 livres on the Englishman, besides giving him letters of nobility. Three years subsequently the remedy was published. It was a highly concentrated vinous tincture of cinchona-bark. Cinchona-trees grow in the densest forests of Peru and Colombia. The task of discovering them, removing their bark, and conveying the latter to the place of export, is troublesome, difficult, and dangerous. In these forests there are no roads. Frightful precipices intersect the path of the *cascarillero*, or bark-gatherer, across which it is difficult to pass, even while unembarrassed by a load. So soon as the treasure of bark has been secured, these difficulties and dangers proportionately increase, so that the comparatively low price at which cinchona may be procured is in itself a matter of surprise.

As for the maritime movement in 1880-'81, it may be judged of by the entries, which were: sailing-vessels, 1,119, with a joint tonnage of 79,600, and 524 steamers of, together, 661,460 tons.

IMPORTS FROM THE UNITED STATES OF COLOMBIA INTO THE FOLLOWING COUNTRIES (MERCHANDISE ONLY).

YEARS.	United States.	United Kingdom.	France.

## EXPORTS TO COLOMBIA FROM THE SAME COUNTRIES.

YEARS.	United States.	United Kingdom.	France.
1878.....	\$4,495,822	\$5,104,555	\$4,083,700
1879.....	5,525,014	4,400,766	4,308,900
1880.....	5,337,314	5,060,216	5,782,092

In 1881 the United States imported from the United States of Colombia \$5,991,890 worth of merchandise, the United Kingdom \$6,677,505, and France \$5,016,006; while the United States exported to Colombia \$5,383,138 worth, the United Kingdom \$5,999,776, and France \$6,214,345.

The commercial statistics published in Colombia fail to show the export of precious stones, such as topazes, found in the country, of excellent quality and in considerable amounts.

## TRADE BETWEEN COLOMBIA AND THE UNITED STATES, 1869-'82, SPECIE NOT INCLUDED.

FISCAL YEARS.	Net imports from the former into the latter.	Domestic exports from the latter to the former.
1869.....	\$5,111,489	\$4,900,075
1870.....	4,827,481	4,612,861

The first and only railroad finished in Colombia, besides the one from Sabanilla to Barranquilla, twenty-eight kilometres, is the Panama Railroad across the Isthmus, seventy-five kilometres (forty-seven miles), now the property of the Panama Canal Company.

Other railroads authorized to be constructed by the Colombian Congress during several sessions of the past two years are: 1. The Northern, to connect the States of Cundinamarca, Boyacá, and Santander with the Magdalena River; 2. The Cauca Railway, from Cali, on the Cauca River, to Buenaventura, on the Pacific, one hundred and thirty-eight kilometres, of

\* Re-export not deducted.

which thirty-three are in operation; 3. The Antioquia Railroad, from Port Berrio, on the Magdalena, to Medellín in the State of Antioquia, two hundred kilometres, of which sixteen are finished; 4. The Cucuta, to the port St. Buenaventura, on the Tulia River, which flows into the Lake of Maracaibo (Venezuela), one hundred and thirty-eight kilometres, one quarter finished; 5. A small railway between the upper Magdalena and the Honda rapids, soon to be finished; 6. The Bogotá and Girardot Railroad, the latter a village near Honda.

A project is besides on foot to connect by rail the port of Riohacha with the rich coal-mines forming the basin of the river Cesar, in the State of Magdalena; and several short branch-lines to stretch from Bogotá to important points in the Savana, such as Facativa, Cipaquirá, Pandi, and others.

Respecting the Panama Canal, a report, which has just been made to Rear-Admiral Cooper, commanding the North Atlantic station, by Lieutenant Raymond P. Rodgers, of the navy, has the great merit of describing simply, intelligibly, and candidly exactly what has been done toward constructing the canal, and what remains to be done. It differs from the rose-colored generalities of the financial managers of the enterprise on the one hand, and on the other from the depreciatory criticisms and the prophecies of evil set forth by the partisans of the rival routes through Tehuantepec and Nicaragua.

Two years ago, when the vanguard of the construction party arrived at Aspinwall, they not only found no part of their way cleared, but even the proposed line of the canal not certainly fixed, and no houses to live in or buildings fit for the storage of their tools, machinery, and property. What has been since accomplished, as Lieutenant Rodgers makes plain, is the building of wharves at the termini, the erection of workshops all along the line, the setting up of machinery therein, the construction of villages for the workmen and engineers, the definite fixing of the axis of the canal, and the clearance of the route from surface impediments to a width of over 300 feet throughout. Lately the delayed contracts have been completed. It is safe to say that the machine-digging of the canal proper will open with vigor at the beginning of the dry season.

But the details also show that a greater quantity of actual excavation has already been done by manual labor than many people suppose. On the Colon section there has been much dredging for the basin in which vessels about to enter the canal may lie in security. At Gorgona the excavation of the main cut has been begun by hand. Beyond Obispo, 650 men have been for some weeks engaged in the actual work of canal-digging. In the Culebra section, which is the highest point of the route, they have dug down to the proposed full depth

of the canal. In short, it is evident from the observations of Lieutenant Rodgers, that not only reservoirs and railways for carrying off the refuse, besides other important aids, have been thoroughly prepared, and docks, quarters, machinery, and rolling-stock made ready, but in four sections the actual work of digging is going on by manual labor.

The theory of a sea-level canal is to be strictly carried out, in preference to the lock system, which the American naval engineers were inclined to consider less difficult and less costly. Lieutenant Rodgers does not conceal his opinion that the completion of the canal, now announced by Count de Lesseps for the year 1888, will be postponed far beyond that date, and the estimate of cost hitherto given, namely, \$120,000,000, will be very largely exceeded. So confident is Lieutenant Rodgers as to the latter point that, although studiously cautious and apparently unswayed by prejudice throughout his report, he yet concludes that "it seems probable that this will undergo the experience of many other great projects—that the original subscribers must again subscribe or lose their venture, and that new stockholders will be the ones who will share the profits." When it is reflected how much remains to be done, and how long the preliminaries have dragged, it seems likely that the canal will not be open before the year 1890, at the earliest; and, as the statistics of Lieutenant Rodgers show that the sum of \$26,000,000 has already been expended, it is also reasonable to suppose that the original estimate of cost will be exceeded. Still, the existing expenditures include the cost of all the machinery thus far ordered, as well as the purchase of grounds, while about 5,000 men are under constant employ. Besides, the eagerness with which the company's shares were taken up makes it obvious that more money could easily be raised if required, and in any case it would seem possible to enlarge the capital stock instead of calling upon the original subscribers to put in more money.

The Colombian Post-Office forwarded, in 1879-'80, 463,832 letters and 413,350 newspapers, and money to the amount of \$2,283,974, exclusive of 4,920 kilogrammes of gold, and 14,348 kilogrammes of silver.

The length of telegraphs in operation in the country, in 1879-'80, was 2,960 kilometres, (1,865 miles), and the number of telegrams passed over the wires was 150,204.

The foreign hospital at Panama received in 1882 1,154 sick persons, of whom only 76 died; the patients received belonged to thirty-three different nationalities. The municipality of the capital, Bogotá, has asked the Federal Government for aid to the extent of \$20,000, in order to improve its sanitary condition.

Two candidates for the presidency are prominently before the country, ex-President Raphael Núñez, for re-election, and General Solon Wilches.

COLORADO. The following were the State officers during the year: Governor, Frederick W. Pitkin (Republican); Lieutenant-Governor, H. A. W. Tabor; Secretary of State, N. H. Meldrum; Treasurer, Nathan S. Culver; Auditor, Eugene K. Stimpson; Attorney-General, Charles W. Wright; Superintendent of Public Instruction, Joseph C. Shattuck; Adjutant-General, Robert S. Roe; State Librarian, Joseph C. Shattuck. Supreme Court—Henry C. Thatcher, Chief Justice, and Samuel H. Elbert and Wilbur F. Stone, associates.

STATISTICS.—From the county returns to the State Auditor of taxable property, it appears that Lake, Fremont, and Gilpin are the only counties which do not show an increase in their wealth. The increased valuation for the year is \$19,884,357.09. The county values are as follows:

Arapahoe.....	\$34,557,730 00
Bent.....	3,282,011 00
Boulder.....	4,477,050 00

Lake County.....	12,788,902 00
La Plata and San Juan Counties.....	40,000 00
Ouray County.....	78,000 00
Park County.....	350,000 00
Pitkin County.....	120,000 00
Rio Grande County.....	250,000 00
Saguache County.....	53,500 00
Summit County.....	1,828,000 00
Total.....	\$22,203,508 72

On the whole, the mining industry was prosperous during the year. In most of the newer districts a considerable increase of development and production took place. The gross return will be somewhat greater than that of 1881. The yield of the Leadville mines is the greatest ever produced in that section. The San Juan country will give a much larger return than ever before, and the same is expected of Gunnison and Pitkin. Summit will yield about the same as in 1881, Boulder nearly fifty per cent more, while Gilpin and Clear Creek will make a good report. But few sales were made, though several of considerable magnitude were under negotiation at the close of the year. There were no excitements and but few important discoveries, yet the development in all sections continued with more or less energy. The most conspicuous event was the removal of the Grant smelter to Denver, and the erection there of one of the finest establishments of its kind in the world. A material advance in the treatment of low-grade ores has been made by the successful establishment of the Bancroft-Walker process, which will take a prominent part in the affairs of 1883. It is understood that a large part of these mills will be manufactured in Denver.

The product of the Leadville district for the last quarter of the year was as follows: Pounds of lead, 17,009,228; ounces of silver, 1,336,212; ounces of gold, 2,921. Total currency value, \$5,783,127. The total value of the output for the last four years has been as follows:

1879.....	\$10,338,740	1881.....	\$13,170,576
1880.....	14,187,697	1882.....	15,220,598

The population of the State in 1880 was 194,327, of whom 129,131 were males and 65,-

196 females, 154,537 natives and 39,790 foreign-born, 191,126 white, 2,435 colored, 612 Chinese, and 154 Indians. There were 93,608 males twenty-one years old and over, of whom 26,873 were whites of foreign birth; 9,321 persons ten years old and upward, or 5.9 per cent, were unable to read, and 10,474, or 6.6 per cent, were unable to write. There were living in the United States 31,827 persons born in Colorado. The yield of barley was 107,116 bushels; corn, 455,968; oats, 640,900; rye, 19,465; wheat, 1,425,014. There were on farms 42,257 horses, 2,581 mules and asses, 2,080 working-oxen, 28,770 milch-cows, 315,989 other cattle, 746,443 sheep, and 7,656 swine. The number of manufacturing establishments was 599; capital, \$4,311,714; hands employed, 5,074; value of material used, \$8,777,262; products, \$14,260,159.

There are at the present time in the State about 2,250,000 cattle, two thirds of which are well bred; 1,000,000 of these cattle are in the south, along the Arkansas and Purgatory Rivers, and the other 1,250,000 are north of the Divide, along the waters of the Republican, the Platte, and in the North, South, and Middle Parks.

**UNITED STATES SENATOR.**—On the 11th of April, George M. Chilcott was appointed by the Governor United States Senator, in the place of Henry M. Teller, appointed Secretary of the Interior, in President Arthur's Cabinet.

George M. Chilcott was born in Trough Creek Valley, Huntingdon County, Pennsylvania, January 2, 1828. He was reared on a farm, and received a common-school education. In the spring of 1844 he removed with his parents to Jefferson County, Iowa, where he lived, working upon a farm, about two years. He subsequently taught school, and also pursued the study of medicine, until the spring of 1850, after which he located near his father and engaged in farming. In 1853 he was elected, on the Whig ticket, Sheriff of Jefferson County, which office he held one term. In 1856 he removed to Burt County, Nebraska, where he was shortly afterward elected to represent the counties of Burt and Cumming in the Lower House of the Legislature, which met in session at Omaha, in the winter of 1856-'57. Mr. Chilcott started, in the spring of 1859, for the famous "Pike's Peak country," arriving at Denver in the month of May. He engaged in prospecting during the summer and in the fall following he was elected from the town of Arapahoe to the Constitutional Convention, which met at Denver. In October, 1860, he removed to Southern Colorado, now Pueblo County. He engaged in farming during 1861-'62, and in 1863 he located upon a farm of his own, twelve miles east of Pueblo. He served as a member of the Territorial Legislature in the first two sessions of that body. In 1863 he received from President Lincoln the appointment of Register of the United States Land-Office for

the District of Colorado. Mr. Chilcott held the position nearly four years, until he was, in 1866, elected to Congress under the State organization then formed, and which sought admission into the Union. But Congress refused to receive Colorado as a State at that time, and Mr. Chilcott could not take his seat. In 1867 he was elected a Delegate to Congress for the Territory of Colorado, and served one term. It was he who introduced and secured the passage of a bill repealing the act which discriminated against all the territory west of the west line of Kansas and east of the east line of California, by charging letter postage on all printed matter between the two boundaries. Mr. Chilcott was a member of the Territorial Council, and president of that body during the session of 1872-'73. He was also a member in 1874. In 1878 he was elected to the State Legislature from Pueblo County, and during the session of 1878-'79 he was prominently before the Legislature as a candidate for United States Senator, Mr. Hill, however, securing the place.

**POLITICAL NOMINATIONS.**—The Republican State Convention met in Denver on the 14th of September, and on the following day nominated candidates as follows: For Governor, Ernest L. Campbell, of Lake; Lieutenant-Governor, William Meyer, of Costilla; Congress, J. B. Belford, of Gilpin; Secretary of State, Melvin Edwards, of Summit; State Treasurer, Frederick J. Walsen, of Huerfano; State Auditor, John C. Abbott, of Larimer; Attorney-General, D. F. Army, of Pueblo; Superintendent of Public Instruction, J. C. Shattuck, of Weld; Regents of the State University, James Rice, of Pueblo, L. S. Cornell, of Boulder; Judge of the Supreme Court, Joseph C. Helm, of El Paso.

Ernest L. Campbell is a native of Woodford County, Kentucky, thirty-six years old. He was educated in Bethany College, Virginia, Harrodsburg College, Kentucky, the Illinois State University at Jacksonville, Heidelberg University, Germany, and the Wurzburg University, Germany. He is a lawyer by profession, and went to Colorado in 1874. In 1879 he went to Leadville, and in 1881 became President of the Bank of Leadville, which position he still holds.

The Democratic nominees were: For Governor, James B. Grant; Lieutenant-Governor, John R. Prowers; Secretary of State, Frank C. Johnson; Treasurer, Dennis Sullivan; Auditor, Ansel Watrous; Attorney-General, B. F. Montgomery; Superintendent of Public Instruction, Frank M. Brown; Regent of the University, J. M. Vanauken; Judge of the Supreme Court, Vincent D. Markham; Congressman, S. S. Wallace.

The Greenbackers nominated for Governor, George W. Woy; Lieutenant-Governor, Theodore O. Saunders; Secretary of State, William N. Bachelder; Treasurer, John L. Herzinger; Auditor, Amos K. Frost; Attorney-General,

Alvah H. Breman; Superintendent of Public Instruction, Mrs. A. L. Washburn; Regents of the University, Seth Terry and William J. Lynde; Judge of Supreme Court, L. F. Hollingsworth; Congressman, Leland W. Green.

**ELECTION RETURNS.**—The election in November resulted in the choice of a Democratic Governor and of Republicans for most of the other offices. The vote in most cases is not officially determined until the meeting of the Legislature in January. Unofficial figures, for Governor, from all but one county, with the reported majority in that, give 29,897 for Grant and 27,552 for Campbell; Democratic majority, 2,345. The following is the declared result for Congressman, Judge of the Supreme Court, and Regents of the University:

Congressman.	Judge.	Regents.
Belford..... 30,347	Helm..... 30,835	Rice..... 32,427
Wallace.... 29,080	Markham.... 29,819	Cornell..... 32,001
Green..... 1,195	Hollingsworth. 1,200	Vanauken.. 27,921
		Lynde..... 1,222
		Terry..... 1,389
Scattering.. 42	Scattering..... 9	Scattering.. 6
Rep. plurality 1,767	Rep. plurality.. 516	Rep. plur... } 4,506 } 4,030

A constitutional amendment, increasing the salaries of the Governor and Judges of the Supreme Court, was adopted at the same election, the vote being 32,861 for, and 8,838 against. The new Legislature will stand:

LEGISLATURE.	S. vote.	House.	Joint ballot.
Republicans .....	17	36	53
Democrats .....	9	13	22
Republican majority....	8	23	31

A Mining and Industrial Exposition was held in Denver in August.

**COMMERCE AND FINANCE, AMERICAN, IN 1882.** A series of disasters befell the country in 1881 which reduced the accumulation of national wealth almost to the vanishing-point. In the severe winter of 1880-'81 great numbers of cattle perished on the Plains. Snow-storms entailed heavy expenses on the transportation companies. The crop of winter wheat was a failure. The parching summer of 1881 caused a deficiency in spring wheat and the other cereals. Corn alone fell five hundred million bushels below the previous crop. Finally, the cotton-crop was a million and an eighth bales less than the product of the season before, and inferior in quality; yet the losses were still within the amount of the exportable surplus, and, coming after years of unusual production, did not check the consumptive demand, and consequently produced no contraction in the general industrial and mercantile business of the country. The effects were, however, serious, though they did not amount to a general commercial depression. The consequences were not developed until 1882. Industrial expansion was arrested in certain directions, particularly in railroad-building and the dependent industries. The general rise in wages con-

sequently stopped short. The prices of the necessities of life at the time became much higher. The discontent of the laboring people, and their extensive and mostly unsuccessful strikes, were the most conspicuous economical features of the year. This state of things continued until the abundant harvests of 1882 caused the prices of food to fall, and relieved the working class from the chief cause of their distressed position. The imports did not begin to decline in response to the shortage in the crops and the diminished exportation during the fiscal year 1881-'82. The revenues of the Government were larger than ever before. The accumulation of a surplus in the Treasury, and the disposal made of it by Congress, aroused a popular demand for the remission of taxes and stimulated the free-trade agitation. The import trade would speedily have caught a fresh impulse from the harvests of 1882, which were as abundant as those of the previous year were deficient; but the uncertainty of the action of Congress caused a partial cessation of operations in all branches of business which would be directly affected by tariff or internal revenue reductions. The stagnation in the tobacco industry and in many other departments, and subsidence in the import trade, were the most noteworthy incidents of the later months of the calendar year. Production and importation had been overstimulated, and stocks had accumulated somewhat in advance of the consumptive demand. Low prices and small profits gave difficulty to the manufacturers and traders in 1881-'82 as dear living did to the workmen. A reaction would have come, which would be greater on account of the falling off in the demand when the losses of 1881 began to be felt; but it was precipitated and exaggerated by the uneasy anticipations of congressional action.

The mania for speculation, which, within a few years, has extended to the staple products of the country, reached an unprecedented height in 1881-'82. With short crops of grain, rings of speculators in Chicago commenced manipulating prices and engrossing supplies. The price of wheat was driven above the exporting point, and European customers supplied their wants from elsewhere. The shipping which visited New York for grain-cargoes deserted that port. American millers were obliged to pay more than normal prices for grain, and the bread of the people was thus made dearer. At the close of the crop-year there was a large stock of wheat remaining. The corners were continued through the first half of 1882, and even when the crop of 1882 was assured, wild and contradictory reports being spread to influence prices. In the final collapse many banks and business houses were dragged down with the losing party of the gamblers. The unsatisfactory slowness with which the new crop of 1882 was exported after the harvest is attributed to the influence of the late speculations.

There was a corner in wheat for July delivery at Chicago, by which the price was run up to \$1.35 a bushel. The losers appealed to the arbitration committee of the Chicago Exchange, which decided that they must settle at the price which the buyers were able to fix. The

St. Louis Exchange shortly before decided that contracts should be settled at a price even below what the sellers were willing to agree to.

The difference in the commercial conditions of the two years is shown in the following table:

ARTICLES.	1881.	1882.
Coin and currency in United States November 1st.....	\$1,455,681,000	\$1,488,888,554

Immigration (eleven months).....		

The prices of the leading staples on or about the 31st of December for three years were as follows:

MERCHANDISE.	1882.	1881.	1880.
Cotton, middling uplands, per pound.....	10 $\frac{1}{2}$ c.	11 $\frac{1}{2}$ c.	11 $\frac{1}{2}$ c.
Wool, American XX, per pound.....	85c. @ 48c.	87c. @ 45c.	87c. @ 48 $\frac{1}{2}$ c.
Iron, American pig, No. 1, per ton.....	\$25 00 @ \$26 00	\$25 50 @ \$27 00	\$24 00 @ \$26 00
Wheat, No. 2 red winter, per bushel.....	\$1 09 $\frac{1}{2}$ @ \$1 10 $\frac{1}{2}$	\$1 41 $\frac{1}{2}$ @ \$1 43 $\frac{1}{2}$	\$1 17 $\frac{1}{2}$ @ \$1 18 $\frac{1}{2}$
Corn, Western mixed, per bushel.....	59c. @ 67c.	65c. @ 71c.	54c. @ 58c.
Pork, mess, per barrel.....	\$18 87 $\frac{1}{2}$ @ \$18 50	\$17 50 @ \$19 50	\$14 00

**FOREIGN COMMERCE.**—The returns of the exports and imports for 1882 present a remarkable contrast to those of the preceding year. This was wholly due to the diminished exports of breadstuffs, cotton, and provisions. Petroleum was the only one of the great staples which showed an increase. The three classes named constituted nearly three quarters of the total exports in 1880-'81. The total exports decreased from \$883,925,947 in 1880-'81 to \$733,073,937 in 1881-'82, over \$150,000,000 less. In the three leading staples the falling off was still greater, as shown in the following table:

EXPORTS.	1881.	1882.
Breadstuffs.....	\$263,561,091	\$176,977,496
Provisions.....	145,622,078	112,595,714
Cotton.....	247,695,746	199,512,644
Total.....	\$658,873,915	\$489,685,854

For the eleven months ending November 30th, the total exports were \$675,021,019, against \$756,487,485 for the same period in 1881, and the imports \$693,310,224, against \$612,871,846, changing an excess of exports of \$143,615,639 into an excess of imports of \$18,289,205. But, for the last five of the eleven months, there was again a favorable balance of \$21,147,825, nearly half as much as for the corresponding period in 1881. The exports in November were heavier than in any month since March, 1881. The large total was due to the heavy shipments of cotton, of which over 700,000

bales were exported. In December the cotton movement reached still greater proportions, more than 750,000 bales being sent out. The exports of breadstuffs amounted to \$165,606,693 for the eleven months, against \$210,318,432 for the same period in 1881. Nearly as much wheat was shipped as in the previous year, the export amounting to 100,345,387 bushels, valued at \$114,441,885, as against 109,814,650 bushels, valued at \$128,318,378; but the corn export was less than one fifth as great in quantity, amounting to 13,057,940 bushels, valued at \$9,944,652, as against 70,263,464 bushels, of the value of \$42,266,154. Indian corn finds a certain demand in Europe, principally for stock-feeding purposes in England. When the supply is insufficient for the domestic requirements, the foreign consumers compete for it until, as in 1882, the price approaches that of wheat. The exports of provisions for the eleven months were in value \$84,863,003, against \$120,345,092 in 1881. In hog products there was a decrease of over 37 $\frac{1}{2}$  per cent, nearly 350,000,000 pounds. During the eleven months of 1882 there was a net export of specie of \$34,817,589, against a net import in 1881 of \$47,211,166 for the eleven months. More than half of this came in the last five weeks of the period. There was still a small export of gold at this time in 1882, but with the export movement of grain retarded, and the prospect of a turn in the current at the opening of the new year. The foreign trade movement for each of the eleven months was as follows, in thousands of dollars:

\* Mileage November 30, 1881, 42,160; in 1882, 46,636.

AGRICULTURAL EXTENSION.—The settlement of new lands, particularly in the Northwest, is an important factor in the prosperity of the country. The occupation of new lands in the fiscal year 1881-'82 greatly exceeded the takings of any previous year. Previous to 1878 the aggregate annual disposals of Government lands under the homestead and timber-culture laws and for cash, ranged between three and five million acres. In that year an increased movement began. The takings in 1877-'78 amounted to 7,168,334 acres; in 1878-'79, to 8,650,219 acres; in 1879-'80, to 9,166,918 acres; in 1880-'81, to 8,379,618 acres; and in 1881-'82, to 12,526,262 acres. Of the latter total, 4,355,039 acres were in Dakota, and 1,085,737 acres in Minnesota, Kansas coming next with 904,061 acres, and Nebraska with 884,028 acres. Railroad lands in the Northwest, which are sold at from four to six dollars an acre, were taken in 1882 in largely increased quantities, the Northern Pacific disposing of 175,772 acres in Dakota and Minnesota, and the St. Paul, Minneapolis and Manitoba Company of 203,143 acres.

CEREALS AND PROVISIONS.—A general crop failure has been regarded as an impossibility in the United States, a country of such broad extent and varied climate. The crop year 1881-'82 showed a deficiency everywhere east of the Rocky Mountains. The season's yield of Indian corn was 1,194,916,000 bushels, against 1,717,434,000 bushels in 1880-'81. The wheat-crops fell off from 498,549,000 to 380,280,000 bushels, a decrease of 118,269,000 bushels. The cotton yield was 1,154,000 bales less, or 5,435,000 against 6,589,000 bales. Pork products in the West decreased from 1,551,331,000 to 1,250,000,000 pounds, or 301,331,000 pounds in meat products, and from 400,976,000 to 297,500,000 pounds, or 103,476,000 pounds in lard. The value of merchandise exports showed a falling off in the fiscal year 1881-'82 of \$151,835,000, nearly 17½ per cent. The yield of the crop-year 1882-'83 is fully as abundant as that of 1880-'81. The wheat-crops are reported to be over 500,000,000 bushels. Corn is estimated by the Agricultural Bureau at 1,680,000,000 bushels, and by other authorities as high as 1,800,000,000

bushels. The cotton-crop is estimated at from one to two million bales greater than in 1881-'82. In cattle and hog production the dearth of 1881-'82 is still felt, but in another year the conversion of the corn into pork will be shown in the provision-trade.

It is estimated that the country produced 440,000,000 bushels more of corn, 130,000,000 bushels more of wheat, and 1,560,000 more bales of cotton in 1882 than in 1881.

Flour has only recently become an important item among American exports. The shipments grew from 2,000,000 barrels in 1868 to 4,000,000 in 1876, and 8,000,000 in 1881. In 1881-'82 they reached from nine to ten million barrels. When flour was shipped in barrels it could not command a market. In sacks it comes in a form of package to which the European consumers are habituated, while the sacks can be baled and returned to be used again, instead of being a dead loss as were the barrels. They also weigh about twenty pounds less, and can be packed more closely in cars and steamships. The quality of American flour shipped abroad is more even and much superior to that sent formerly. The millers of Minneapolis have taken pains to establish a reputation for their brands in England, and are succeeding in overcoming the old prejudice against American flour. They buy up all the choice grades of spring wheat, which can be obtained in Europe in no other form than in their "patent" or roller-ground flour, a product which English millers can not equal. With freight rates to Liverpool almost as low as are ordinarily paid on either the rail or the steamship alone, and with agents in the principal towns of Great Britain, they reap the full advantage of their unlimited water-power.

The total number of swine slaughtered during the regular pork-packing season of 1881-'82, that is between November 1st and March 1st, was reported by the Cincinnati "Price Current" as 5,747,760, a decrease of 1,171,696 from the preceding winter. Summer packing was formerly insignificant, but with ice and refrigerating appliances, it has attained dimensions which practically obliterate the old limits of the season. In 1881 it numbered 4,803,699 swine, against 5,323,893 in 1880, making the packing for the whole year 10,551,-

\* Excess of exports.

† Excess of imports.

449, a decrease of 1,691,905. The smaller supplies of 1881-'82 caused an advance in price which was carried to the highest point by speculative forestallers of the market. The gross cost in the winter was \$7.58 per 100 pounds, against \$5.80 the preceding season. In the beginning of the summer-packing season of 1882 the expectations of a short supply were not realized, for more hogs, and of greater weight than the preceding spring, were sent to market.

**COTTON.**—The cotton-crop of 1881-'82 was 5,435,845 bales. The exports amounted to 3,595,031 bales, and the takings of American spinners to 1,661,206 bales; leaving a stock on hand on the 1st of September of 120,722 bales. The crop of 1880-'81 reached 6,589,329 bales; the stock on hand, September 1, 1881, 212,233 bales. The movement of the crop compared with the previous season was as follows: shipped to Great Britain, 2,311,790 bales, against 2,843,957; to Channel ports, 80,060, against 56,210; to France, 381,186, against 556,344; to other foreign countries, 821,995, against 1,139,768; total exports, 3,595,031, against 4,596,279; shipments from Tennessee, etc., direct to manufacturers, 477,481, against 510,239 bales; manufactured in Southern mills, 238,000, against 205,000; shipped overland, 1,134,788, against 1,090,067. The overland movement had increased very greatly in the three years preceding 1881, but in that year, with an increase in the crop of 14.25 per cent, the rail shipments were 7.71 less than the year before. In 1882, although the crop was 17.50 per cent smaller than the previous years, the quantity shipped overland was 4.10 per cent greater. The average weight of bales in 1881-'82 was 475.67 pounds, against 485.88 pounds in 1880-'81. The crop was of high average quality, dry and clean.

The Sea Island crop was 38,552 bales, against 36,442 in 1880-'81, and 26,704 in 1879-'80. Florida and Georgia produced more and South Carolina less than the previous season. American spinners consumed 14,762 bales of this staple, 3,492 bales more than in 1880-'81; the exports were 24,756 bales, against 24,395 in 1880-'81.

The new crop of 1882 was about two weeks late in planting, and continued backward till the harvest. The planting was large, and the season remarkably favorable and free from drought or caterpillars, and with less shedding than usual. The boll-worm did considerable damage, however, west of the Mississippi. Although the growth was excessively vigorous, the plants matured well. Frosts were later than usual, but prevented a portion of the bolls from ripening in the northern part of the cotton belt. The weather of the picking season was exceptionally favorable. The December report of the Bureau of Agriculture makes the approximate size of the crop of 1882-'83 6,700,000 bales of 460 pounds.

The takings of Northern spinners were

1,661,206 bales, against 1,686,804 in 1880-'81. The consumption for the year is estimated at 1,986,206 bales: 1,748,206 bales in the Northern and 238,000 bales in the Southern mills. The estimated consumption of 1880-'81 was 1,855,000 bales. For the manufacturers of printing cloths at least the year was an unsatisfactory one. The mills were kept in operation during the whole crop year, except slight stoppages on account of strikes at Cohoes and Fall River. The increased consumption was far short of the enlarged capacity of the mills. There were about 575,000 new spindles added during the year; new and improved spindles were largely introduced, which raised the average capacity per spindle to, perhaps, 67 pounds in the Northern and 153 pounds in the Southern mills. In the census year their capacity was estimated by E. Atkinson at 65.83 pounds North and 149.77 pounds South. The total number of spindles in this country on the 1st of September is estimated at about 12,000,000. The speculation in cotton placed the manufacturers at a disadvantage. One effect of the speculation which prevailed in 1881-'82 was that the price of American cotton was lower during the whole year in Liverpool than it was to American spinners. Wages had risen considerably since 1878. The manufacturers, to preserve their margin of profit, resorted to a reduction of wages, although the cost of living had recently been greatly enhanced. As soon as the crop of 1881-'82 was estimated in the fall of 1881, and known to be only about 4,500,000 bales, speculators took possession of the cotton market. Southerners particularly were confident that a cotton famine would result, and many expected the price to go up to twenty cents a pound. Contracts for future delivery were taken without limit. The English dealers and manufacturers had enough on hand to defer their purchases until they had tired out the speculators. The corners consequently broke down in the spring. A few months later, when the world's stock was really running very low, speculation rose to a still greater height.

Altogether the cotton market suffered almost as much as the wheat export and milling trades from the disturbing effects of speculative gambling; although the foreign trade could only be retarded, not permanently lost, as when the export of surplus breadstuffs is interfered with. The price of middling uplands was forced up to 13 cents by a corner during that interval between the old crop and the new, which is the usual opportunity of speculators. From that price, in July, it fell to 10½ cents when the new crop began to move, and between the 1st of September and the last of December the exports exceeded those of the previous year by over 500,000 bales. Many of the cotton-mills were obliged to close, or work part time.

Notwithstanding improved machinery, and wages so low that the cost of labor per pound of cotton cloth, when genuine, is no higher

than in Manchester, the export trade in 1881-'82 actually receded. The quantities of cotton manufactures exported for the last four years,

ending June 30th, with their values, were as follows:

EXPORTS.		1882.	1881.	1880.	1879.
Colored goods	yards	29,525,672	63,184,293	37,758,166	45,116,058
	value	\$2,326,319	\$4,983,312	\$2,956,760	\$3,209,285
Uncolored goods	yards	114,994,402	80,399,154	68,821,567	84,031,319
	value	\$9,351,718	\$6,624,374	\$5,834,541	\$6,288,181
Other manufactures of cotton, value		1,534,947	1,963,601	1,190,117	1,856,534
Total value		\$18,212,979	\$13,571,287	\$9,961,418	\$10,858,950

The British exports of cotton manufactures are nearly thirty times those of the United States, amounting, for the calendar year 1881, to \$395,000,000.

The European consumption was about 6,786,000 bales, of 400 pounds, against 6,528,000 in 1880-'81, and 6,075,000 in 1879-'80. The large increase in 1880-'81 was due to the poor quality of the crop. Some of that year's cotton was so damp and sandy that it only brought 2*d.* and 3*d.* a pound in Liverpool. Ellison estimates the European imports for 1882-'83, on the basis of an American crop of 6,800,000 bales, as follows: Imports from the United States, 4,500,000 bales; from the East Indies, 1,450,000 bales; from other countries, 950,000 bales; total imports, 6,900,000 bales. The stock on hand, October 1st, was estimated at 771,000 bales, making the total supply 7,671,000 bales, of which 6,563,000 will be delivered for consumption, and 1,078,000 remain in store on October 1, 1883. The number of spindles in Europe, the United States, and India, in 1882, were as follows: Great Britain, 41,000,000; the Continent, 21,855,000; the United States, 12,000,000; India, 1,620,000; total, 76,475,000, an increase of 1,684,000 since the preceding year.

**PETROLEUM.**—The export of petroleum in 1881-'82 rose to about \$50,000,000, an increase of \$12,000,000. The total value of the produce of the wells, since the first one was sunk in 1859, is estimated at \$1,500,000,000. This addition to the wealth of the country has been mainly contributed by the foreign consumers. China, Japan, and India have become as steady customers for American oil as Germany and England. Vast quantities are sent to the Mediterranean. There is hardly a country in which this illuminant is not used. America is the only important accessible source at present. The yield last year was nearly 27,000,000 barrels. The consumption is about 71,000 barrels a day. The production in the early part of the year was about 80,000 barrels daily. There was a stock on hand of about 30,000,000 barrels in the summer. Although the oil-fields of Pennsylvania have several times appeared to be at the last limit of the supply, new wells have been struck each time when the stock was running low. With an increasing demand, which would not fail if the price were several times as high, and with the production constantly declining, until a new discovery

gluts the market, oil is one of the most tempting subjects for speculation and corners, and one of the most disappointing hitherto, for each new discovery has proved richer than the preceding. Since the establishment of the pipeline and common reservoirs, the facilities for speculative dealings are complete. The Pipeline certificates are as easily exchanged as bank-notes. There are Oil Exchanges at New York, Philadelphia, and Pittsburg, and at Titusville, Oil City, Bradford, and Warren. The depth and extent of the oil-producing rock are well known, and the time is approaching when the world must look to the Caucasus, China, or some field yet unknown for its rock-oil. From 1866 till 1872, when the now exhausted wells in Venango County and along Oil Creek were the source of supply, the price was \$4 or \$5 a barrel. Since the discovery of the Butler County field, in the latter year, production has generally exceeded consumption. When the Butler wells began to run dry, the Clarion County deposits were struck, with the famous Bullion wells, pouring out 2,000 and 3,000 barrels a day each, and driving the price down to \$1.50 a barrel. The Clarion fields were soon exhausted; but immediately the Bradford deposits, the richest ever known, were discovered. These lasted five years, and swelled the production to sometimes 100,000 barrels a day, fully double the consumption. In May, 1881, when the Bradford wells were rapidly declining, oil was struck in Alleghany County, N. Y. The summer of 1882 was one of the most memorable in the history of petroleum speculation. In the spring the new wells at Richburg, N. Y., began to fail. The price of oil was 80 cents on April 1st, but was rising rapidly toward \$1 a barrel. Speculation was excessively active. Future contracts were dealt in to enormous amounts. On May 18th a well was struck in another new district in the forests of Warren County, Pa. The oil-bearing rock was pierced by the drill at the depth of 1,612 feet, in Cherry Grove Township, Warren County. Other wells were found in the same locality which yielded from 2,000 to 3,000 gallons a day, bringing the production up to 25,000 barrels daily in the new district and 105,000 barrels for the entire oil-regions at its highest point in August. The price fell to 50 cents, the lowest quoted since 1874. The owners of the new springs showed the characteristic feverish haste to realize, exploding nitro-

glycerine cartridges at the bottom of the wells when the flow diminished. In September the Cherry Grove wells suddenly declined, reducing the daily production by 25,000 barrels. For the first time in five years it approached the consumptive demand. A speculative excitement followed, which transcended all former limits. The sales in September in the exchanges of the oil districts, where the largest transactions took place, amounted to as much as the whole existing stock multiplied several times. The price rose above \$1 a barrel. With an immense stock on hand, such prices could not be sustained, notwithstanding the failing supply. When the bubble burst, and the price receded to 80 cents, thousands of speculators were ruined, business firms all over the country embarrassed, and three banks obliged to close. The extreme range of prices during the year was from 87 cents in February to less than 50 cents in June, then to \$1.46 in November, and back to 75 cents in December. The field for future discoveries of petroleum is probably limited to Warren and Forest Counties, Pa.; Butler, Armstrong, Clarion, Venango, Crawford, and Bradford Counties being nearly exhausted of their deposits, and the territory in McKean County and New York State thoroughly explored.

**IRON.**—The production of iron and steel in the United States, in 1881, was reported by the Secretary of the Iron and Steel Association as follows: Production of pig-iron, in net tons, 4,641,564, including 21,086 tons of spiegel-eisen; production of all rolled iron, including nails and excluding rails, 2,155,846 tons; Bessemer-steel rails, net tons, 1,330,302; open-hearth steel rails, net tons, 25,217; iron and other rails, net tons, 488,581; production of iron and steel street-rails, included in above, 21,554; crucible-steel ingots, net tons, 89,762; open-hearth steel ingots, net tons, 146,946; Bessemer-steel ingots, net tons, 1,539,157; blister and patent steel, net tons, 3,047. Production of all kinds of steel, net tons, 1,778,912. Production of blooms from ore and pig-iron, net tons, 84,606. The imports during the year were, in value, \$61,555,078; exports, \$15,782,282.

The iron business is peculiarly subject to fluctuations, owing to its dependence on railroad-building, and to the fitful way in which railroad extension takes place. In 1881 commenced the greatest era of railroad construction which the country has seen, but the one of the shortest duration. In 1882 there were over 11,000 miles of railroad built, more than in any previous year. In the spring a great strike of the iron-workers for higher wages was started at Pittsburg, Pa., and extended to all the iron-producing districts. For over three months, more than 100,000 men were kept out of work. But the fever for railroad extension had already subsided, and the wants of the lines under way were in great part supplied. The dissatisfied workers lost the con-

test. The powerful trade organization of iron and steel workers was broken up. Before the year ended this great branch of industry began to languish. Rails were sold in large quantities for \$38 a ton, the lowest price ever reached. In December hundreds of establishments were closed, or running on half-time.

The production of coal was reported for the year 1880 as 28,646,995 net tons of anthracite, and 42,420,580 tons of bituminous. In 1881 the anthracite product amounted to 28,500,016 gross tons.

**THE MONEY MARKET.**—Notwithstanding the expansion of the currency, the demand for money was so active in 1882 that the average rate of interest rose perceptibly during the year. The diminution in the volume of the currency from exports of gold was more than restored by the silver certificates which represented the silver dollars which had accumulated in the Treasury since their coinage was begun, and were now added to the circulation by this device. The Secretary of the Treasury endeavored to return to circulation the surplus accumulating from taxes as rapidly as possible, and his payment of bonds and other transactions he conducted with regularity, so as to disturb business as little as possible. In October and November there was great stringency in the money market, which was increased by the manipulations of bank funds by stock operators, but relieved, as far as it was due to this cause, by the accelerated payment of called bonds by the Treasury. In December the market was easier.

In January, 1882, the inflow of gold, which began on a large scale in 1879, and had continued without interruption since, ceased, and in February a contrary movement began which continued until August. During this period \$34,000,000 net were exported from the country. In September, although the balance of trade was still heavy against the United States, the draughts against future shipments and the purchase of American securities abroad turned the tide. Nearly a million was received in that month from the West Indies and Mexico on English account, and about \$3,750,000 in October. Small consignments arrived later from Europe, but, owing to the return of some speculative securities and of called United States bonds, exchange wavered for the remainder of the year about the gold-importing point.

The rapid payment of the Government debt endangered the note circulation of the national banks. The process could not go on as rapidly in the latter half of the year 1882-'83, since by the 1st of December about \$85,000,000 of the estimated surplus income for the year had been already thus applied, leaving only \$35,000,000 for bond redemption up to June 30, 1883. Comptroller Knox suggested three ways of enabling the banks to continue their circulation: 1. Reducing the interest on the 4 and 4½ per cents by paying or compounding the

premium, and then issuing circulation to the amount of 90 per cent of the par value. 2. That the law be amended so that notes may be obtained to within 10 per cent of the market value of the bonds, with a provision for an additional deposit in case of depreciation. 3. That the tax on circulation be reduced to an amount sufficient to simply cover the expenses of the Treasury incident to the issue of these notes. The Beck law against the over-certification of checks was directed against a profitable branch of the business of New York banks. Upon the opinion of the Attorney-General that the "acceptance" of overdrawn checks was an evasion of the law, several of the largest national banks of New York city prepared before the new year to retire their circulation, which was but slightly profitable, owing to the contracted supply and high prices of United States bonds, to resign their charters, and to reorganize as State banks.

The national banking system has many enemies, but Congress passed without hesitation the bank extension act which was necessary in order to enable those banks organized under the first banking laws to continue their existence. The act contained a provision for the exchange of the five per cent Government bonds continued temporarily as three and a half per cents for three per cent registered bonds, also redeemable at the pleasure of the Government, but only after all bonds bearing a higher rate of interest which may be payable have been redeemed. Of these three per cent bonds, those which are last issued are to be paid off first, and the earliest issued called in last.

The total amount of coin and currency in the country at the date of resumption, and on each 1st of November subsequent, as estimated by the Comptroller of the Currency, was as follows:

CURRENCY.	Jan. 1, 1879.	Nov. 1, 1879.	Nov. 1, 1880.	Nov. 1, 1881.	Nov. 1, 1882.
Gold coin.....	\$278,310,126	\$355,631,532	\$453,582,692	\$562,568,971	\$567,105,456
Silver coin.....	106,573,803	126,009,537	158,320,911	186,087,365	212,824,335
Legal-tender notes.....	346,681,016	346,681,016	346,681,016	346,681,016	346,681,016
National-bank notes.....	823,791,674	887,181,418	843,584,107	860,344,250	862,727,747
Totals.....	\$1,055,856,619	\$1,165,558,503	\$1,802,718,726	\$1,455,681,602	\$1,488,588,554

The gold production of the year ending November 1st is reported as \$43,359,021. During the year there was a net export of \$36,122,536. Taking the amount used in the arts as \$2,700,000, there remained \$4,536,483 to be added to the gold currency. From the date of resumption to November 1, 1882, there was a total excess of imports of gold over exports of \$161,-

311,578. The total product of the mines for the same period is estimated at \$147,509,021. The total amount of standard silver dollars coined up to November 1, 1882, was \$128,329,880.

The amounts of gold, silver, and paper currency in sight at the same dates as above were as follow:

MONEY IN SIGHT.	Jan. 1, 1879.	Nov. 1, 1879.	Nov. 1, 1880.	Nov. 1, 1881.	Nov. 1, 1882.
GOLD.					
In the Treasury, less certificates.....	\$112,703,342	\$156,907,986	\$188,679,349	\$167,781,909	\$148,495,473
In national banks, including certificates.....	35,039,201	87,187,298	102,851,082	107,222,169	94,127,324
In State banks, including certificates.....	10,987,812	12,171,292	17,102,130	19,901,491	17,892,500

Total silver.....	\$38,879,908	\$58,780,823	\$84,472,626	\$108,095,207	\$131,411,701
CURRENCY.					
In the Treasury, less certificates.....	\$14,425,655	\$21,711,376	\$18,221,826	\$22,774,880	\$26,224,248
In national banks, including certificates.....	126,491,720	118,546,969	86,439,925	77,630,917	92,549,767
In State banks, including certificates.....	25,944,485	25,355,260	23,828,794	27,919,817	27,086,432
In savings-banks.....	14,513,779	15,890,921	17,072,680	11,782,248	14,724,978
Total currency.....	\$211,375,639	\$181,698,946	\$147,563,225	\$139,579,807	\$160,580,475
Grand totals.....	\$408,985,902	\$446,741,285	\$485,668,362	\$537,588,083	\$552,447,473

Deducting these totals from the amounts computed as the total stock in the country, the

amounts held by the people at each date are approximately determined as follows:

IN THE HANDS OF THE PEOPLE.	Jan. 1, 1879.	Nov. 1, 1879.	Nov. 1, 1880.	Nov. 1, 1881.	Nov. 1, 1882.
Gold.....	\$119,629,771	\$149,415,016	\$200,250,181	\$267,668,402	\$306,650,159
Silver.....	67,693,695	67,223,714	78,348,285	82,989,158	80,912,684
Currency.....	450,097,051	502,168,488	542,951,898	567,445,959	548,828,258
Totals.....	\$646,420,717	\$718,512,218	\$817,050,864	\$918,045,519	\$936,391,051

It thus appears that the people increased their hoardings of gold between November 1, 1881, and November 1, 1882, about forty millions, and decreased their hoardings of silver about two millions and their hoardings of currency about nineteen millions.

A new kind of currency was introduced in October. Gold certificates were issued on the deposit of gold in the Treasury at Washington or the sub-Treasury at New York. Bankers hastened to make the Government vaults the repository for their gold. The Bank of America, however, still kept the reserves of the Clearing-House banks. Within a month, nearly \$30,000,000 of the gold certificates were in circulation. The greater part of the customs dues were paid with this more convenient medium. This threatened to cut off the source from which the Treasury reserve held against the greenback circulation was kept, as the law contained no provision for the cancellation of certificates received by the Treasury, and only imperfectly guarded against the danger by directing the Secretary to cease issuing new ones after the reserve has sunk below \$100,000,000.

The increase in the circulation of standard silver dollars between November 1, 1881, and November 1, 1882, was less than a million and a half of dollars, although \$27,772,075 had been coined in the mean while. Of the \$128,329,880 coined since the passage of the act of February 28, 1878, only \$35,383,786 were in circulation. There were silver certificates outstanding for \$65,620,450, leaving \$26,794,527 belonging to the Treasury. The amount of silver certificates in circulation had decreased during the year to about the same amount that the circulation of silver dollars had increased. The new gold certificates are expected by the Secretary of the Treasury to expel the silver certificates. The state of India exchanges had caused an accumulation of India Council bills, leaving three fifths of the £15,000,000 annually drawn by the English Government to be disposed of between the 1st of January and the 31st of March, 1883. The price of silver declined from 52½d. per ounce, to 50d., so that the bullion value of the silver dollar stood at only 84 cents at the close of the year.

The Kiernan interest law, abolishing the penalties for usury as far as call loans are concerned in New York, had the desired effect of putting an end to the fractional commissions charged in stock transactions in times of active speculation and a tight money market. These daily commissions raised the rate of interest in sudden leaps to 11, 16, 28, 51, and sometimes 96 per cent per annum, and therefore greatly favored manipulators of the money market. Only on one occasion since the passage of the bill in May was there an attempt made to revive the commission system. It was in the last week of September, and was the result of the locking up of loanable funds by speculators for a fall in stocks. The stringency was re-

lieved by the redemption of bonds at the order of the Secretary of the Treasury. One effect of the new interest law was to attract loanable capital to some extent from Canada when scarce in New York. Toward the end of the calendar year there was a tendency to higher rates for money. At the close of November, prime commercial paper was discounted at the rates of 7 or 8 per cent, with an easier market in December, and rates ranging from 5½ to 6½ per cent.

The average rate of interest in New York for each year since 1874 has been as follows:

YEAR.	Call loans.	Commercial paper.
1874.....	8.8 per cent.	6.4 per cent.
1875.....	8.0 "	5.8 "
1876.....	8.3 "	5.2 "
1877.....	8.0 "	5.2 "
1878.....	4.4 "	5.1 "
1879.....	4.4 "	4.4 "
1880.....	4.0 "	5.3 "
1881.....	3.8 "	5.0 "
1882.....	4.4 "	5.4 "

The exchanges in New York aggregated about \$47,000,000,000 during 1882, against \$49,376,882,883 in 1881. They were less swelled by stock speculations. The estimated portion belonging to legitimate trade is estimated in the "Public" at \$31,500,000,000, against \$31,483,517,189 in 1881. The aggregate exchanges of twenty-five cities besides New York amounted to about \$14,600,000,000 in 1882, against \$14,900,000,000 in 1881. The exchanges of the minor cities and those of New York also were more affected than ever before by speculation in produce.

THE STOCK MARKET.—A remarkable change was noticed in the sentiments of the public toward railroad enterprises in 1882, contrasting curiously with the buoyant and adventurous eagerness with which business-men speculated on the prospects of railroad lines a year or two before. The diminished traffic of 1881 and the trunk-line war naturally depressed values. There was a partial recovery at the close of the rate war from the very low market of February, but in March the market threatened to break down. The two leading operators sought to inspire confidence, the one by displaying his own enormous holdings of securities, the other by hopeful predictions. It afterward transpired that they had parted with some of their property at the better prices which their own assurances had obtained. It was suspected that the railroad war and the one which followed on the Northwestern roads were contrived by directors who had sold their shares and wished to regain them cheaply. It was suspected after a sudden fall of prices in April that the market had been artificially sustained and then depressed with a preconceived purpose. The reports of railroad officers were more enigmatic than ever before, and the affairs of the corporations elaborately confused. The new railroads constructed within three years at a cost of some \$700,000,000, and represented

by twice that amount of new securities, were most of them competitive lines of doubtful prospects themselves and calculated to injure the prospects of existing lines. The intrinsic worth and promise of the railroads were nevertheless as strong in the latter part of 1882 as at any time in the past. But the frequent recent experiences of the misdirection of corporate business and concealment of corporate affairs for stock-jobbing purposes had destroyed public confidence in share property. There was a purchasing movement when the crop prospects became known in July and August, but the market drooped during the remainder of the year. The prices of many stocks sank to the lowest figures known for years. Speculative operations were pretty much confined to the few gigantic operators, and the *habitues* of Wall Street, who base their ventures on conjectures as to the intentions of the "railroad kings." There was no speculation for a rise among these, for the notion prevailed that Gould was opposed to higher range of prices. Some of the speculative stocks, such as Denver and Rio Grande, Richmond and Danville, Louisville and Nashville, and Hannibal and St. Joseph, passed rapidly through a long decline. Persons of speculative proclivities who had learned to shun the Stock Exchange resorted to the more harmful speculations in produce, which reached a stage in 1882 in which the Legislatures and even the Produce Exchanges debated about the means of suppressing speculations in future contracts on margins. Government securities were higher than ever before in 1882, and the more stable classes of railroad bonds rose somewhat in price. This was not owing to a decline in the average rate of interest, but to the accumulation of capital held in trust which is limited to such investments, and partly to foreign competition for the stronger class of investments.

Railroad business suffered more than any other from the national disasters of 1881. The storms of the winter of 1880-'81 added greatly to their running expenses. When the failure of crops and the operations of grain speculators reduced the traffic far below their collective carrying capacities, the trunk-lines engaged in a war of rates in competition for the diminished traffic in order to force from one another more favorable terms in a future pooling arrangement. The contest lasted eight months, and its effects were felt for twelve. The stock market more than discounted these adverse influences. Railroad enterprise was suddenly paralyzed. Up to the middle of 1881 railroad shares and securities had risen greatly in market value since the revival of business. From that period to the close of 1882 the values wavered or declined. This was owing to the timidity of foreign investors, and the fact that the probable returns from railroad investments were at the scale of prices already reached for the more approved securities below the normal rate of American profits, while the extension of indus-

try in many directions was constantly opening more promising fields for home capital.

Railroad construction in 1882, while falling short of the enormous mileage projected for the season's work, exceeded considerably that of 1881, and was largely in excess of the construction of any previous year. The mileage of new track laid in 1882 was over 10,000 miles. While the lines for which capital had been paid in, contracts made, and materials provided were being finished, the buoyant feelings which prompted the formation of many new schemes in the previous year fell to a low ebb, and several of those projects were abandoned or postponed. The railroad mileage of the United States doubled between 1870 and 1881, increasing from 52,914 to 104,813 miles. If all the portions of the country which are equal to Ohio in natural resources were as well provided with railroads as that State is at present, 150,000 miles additional would have to be constructed; and if the present mileage of Ohio, which has one mile of railroad to six square miles of territory, represents the average mileage of the United States when the network is completed, the country will have at least 500,000 miles of railroad lines. Complete data have been collected for 1881. The length of line constructed was 9,358 miles, the heaviest construction in any former year having been 7,379 miles in 1871. The cost of the new roads built in 1871, estimating it at \$25,000 per mile, aggregated \$233,750,000. Including the expenditure upon improvements on existing roads and upon the completion of new lines already laid, the capital outlay for the year was as much as \$400,000,000. The number of persons employed in operating the railroads is estimated at twelve per mile, or over 1,200,000, in addition to whom about 4,000 were employed in construction. The tonnage transported in 1881 is estimated in Poor's "Manual" at 3,500 tons per mile, which, valued at \$50 per ton, with one third deducted for duplication, would amount to \$12,000,000,000, or more than \$200 per head of the population. One of the great trunk-lines has a greater tonnage than all the railroads of the country in 1851, when it did not exceed \$10 per head of the population.

The trunk-line war of the autumn and winter of 1881-'82 was commenced by Vanderbilt, who considered that the pooling arrangement existing between the through railroads discriminated against the Central Railroad and the commercial interests of New York. The rates previously agreed upon were two cents less per hundred pounds from Chicago to Philadelphia, and three cents less to Baltimore than to New York. The managers of the two trunk-lines terminating in New York demanded a new arrangement by which the freight should be made the same on all the routes. After eight months of unprofitable underbidding, the managers of the railroads referred the dispute to an advisory commission consisting of ex-Senator Thurman, ex-Minister Washburne, and Judge Cooley, of

Michigan. The arbitrators, after listening to the different representations regarding relative distance, net cost of transportation, port and elevator charges, etc., decided that the former pool was as good a working arrangement as they could suggest; the war, therefore, ended where it began.

The New York, Chicago, and St. Louis, nicknamed the "Nickel-Plate" line, one of the new companies formed in 1881, with a capital stock of \$50,000,000 and a bonded debt of \$15,000,000, after completing the 521 miles of line from Buffalo to Chicago, changed ownership in October, passing into the control of the Vanderbilt interest. The original subscribers had invested some \$20,000,000 in the road, for which they held \$15,000,000 of bonds in addition to the stock, with \$4,000,000 additional outlay, for which short equipment bonds were issued. The syndicate to obtain a controlling interest in the property, subject to these two liens, so as to stop the competition of the new road, paid \$7,290,000 for a majority of the stock.

In November the railroad corporations of the Northwest, notwithstanding the pressure of traffic which was equal to all their facilities, entered into a desperate war of rates. The quarrel was about disputed territory, though a stock-jobbing intrigue was also alleged. The cutting of rates continued one month, when the war ended in the absorption of the St. Paul and Omaha by the Chicago and Northwestern road, making it subsidiary to the Vanderbilt combination. The Hannibal and St. Joseph Railroad passed in September into the control of Messrs. Gould, Sage, and Dillon, who purpose making Chicago, instead of Omaha, the eastern terminus of the Union Pacific. The stock was purchased of the speculators, who by a "corner" forced the price up to 350 in September, 1881. The Union Pacific syndicate took from them nearly the whole of the common stock of the road at a price which entailed heavy losses upon the manipulators of the corner.

The Western Union Telegraph Company, upon its amalgamation with the Atlantic and Pacific and the American Union Companies in the early part of 1881, issued \$15,000,000 of new shares in exchange for the stock and bonds of the American Union, \$8,400,000 to the holders of Atlantic and Pacific shares, and distributed something over \$15,500,000 as a stock dividend among its own shareholders, issuing altogether \$80,000,000 of new stock. Prior to the consolidation the outstanding capital stock of the Western Union Company was somewhat less than \$39,000,000. Some of the stockholders contested the emission of the shares which were given as a bonus to the Western Union shareholders. The points raised in equity were decided in favor of the company; but on review of the question the General Term in November, 1882, declared the stock dividend illegal. Jay Gould and his associates, who control the Western Union, obtained a majority of the

stock of a new opposition line, the Mutual Union, in March; but the managers succeeded in escaping control. A suit was brought in the name of Jay Gould to annul the charter of the Mutual Union, on the ground of the unauthorized increase of its capital stock. The contention was not upheld by the court. The Western Union company leased the American Cable, guaranteeing 6 per cent upon its \$10,000,000 of stock raised to \$14,000,000. By a combination with the Anglo-American Cable Company it controls the telegraphic intercourse with Europe. One of the projects started in 1882 was a new transatlantic cable line, of which James Gordon Bennett, of the "New York Herald," is the chief promoter. The mileage of the Western Union Telegraph, as reported June 30th, is 131,060 miles of line and 374,368 miles of wire.

The gross earnings of the railroads in operation in 1881 amounted to \$725,325,119, about \$110,000,000 more than the preceding year; and the net earnings to \$276,654,119, some \$21,500,000 more. The operating expenses were about 62 per cent of the gross receipts. During the year \$128,887,002 were paid in interest on the funded debts and \$93,344,200 in dividends on the stock, against \$77,115,411 in 1880. In the ten years from 1872 to 1881 the mileage of American railroads in operation increased from 57,323 to 94,486 miles; their aggregate capital and funded debt from \$3,159,423,057 to \$5,010,389,579; their gross earnings from \$465,241,055 to \$725,325,119; their net earnings from \$165,754,373 to \$276,654,119; the freight receipts from \$340,931,785 to \$551,968,477; the passenger receipts from \$132,309,270 to \$173,356,642; the dividends paid from \$64,418,157 to \$93,344,200.

The dividends declared in 1882 showed that the railroads had not suffered as much as was anticipated. The New York Central lost most by the freight-war, and was obliged to anticipate future profits and pay its regular 8 per cent dividend with borrowed money. During the closing months of the crop year 1881-'82 the traffic on this line fell off largely, owing to the grain operations in Chicago known as the Keene corner. The average rate obtained per ton per mile for all kinds of freight was reported for the year ending September 30th, as 73 hundredths of a cent, which is exactly one half the price obtained for carriage in 1873-'74. The Erie and the Baltimore and Ohio roads were helped by the improved coal-traffic, and paid, the first 6 per cent, with another 6 per cent announced for 1883, the first dividends declared by this company since its reorganization; and the other the 10 per cent dividend to which it had returned the year before. The Pennsylvania Railroad also paid a dividend of 8 per cent, 2 per cent of it in stock, but represented by recent financial operations. The railroads of the growing Northwest reported an exceedingly profitable business. Roads which were formerly bankrupt paid in 1881

and 1882 dividends of 7 per cent, and others paid as much on stock which had been largely increased, in the case of the Rock Island Railroad actually doubled. The coal roads, except those which are in liquidation, have resumed the payment of dividends. The railroads of the South show the least profitable business, though in some of their reports marked signs of progress are seen.

**CONGREGATIONALISTS.** The following is a summary of the statistics of the Congregational churches in the United States, as they are given in the "Congregational Year-Book" for 1882:

STATES AND TERRITORIES.	Churches.	Ministers.	Church-members.
Alabama	15	16	920
Arizona	1	1	22
Arkansas	2	3	81
California	86	78	5,186
Colorado	27	29	1,081
Connecticut	297	376	55,202
Dakota	50	36	1,006
District of Columbia	4	16	892
Florida	2	2	78
Georgia	12	11	913
Illinois	246	299	22,842
Indiana	31	22	1,612
Indian Territory	4	2	80
Iowa	286	196	15,865
Kansas	197	140	5,885
Kentucky	1	3	86
Louisiana	19	17	1,543
Maine	238	205	22,081
Maryland	2	1	222
Massachusetts	528	611	39,962
Michigan	240	290	17,127
Minnesota	145	116	7,085
Mississippi	5	2	151
Missouri	72	62	3,953
Nebraska	185	85	3,682
Nevada	1	1	28
New Hampshire	138	194	20,157
New Jersey	25	34	3,254
New Mexico	3	4	31
New York	253	261	35,258
North Carolina	6	6	396
Ohio	214	182	23,209
Oregon	14	16	839
Pennsylvania	27	33	2,086
Rhode Island	27	40	5,422
South Carolina	2	3	182
Tennessee	5	9	417
Texas	9	10	222
Utah	2	3	173
Vermont	197	199	19,951
Virginia	3	4	314
Washington Territory	23	14	384
West Virginia	3	3	126
Wisconsin	194	184	13,315
Wyoming	3	4	152
Total	3,804	3,718	381,697

Of the churches, 2,858 were entered as "with pastors," and 946 as "vacant." Of the ministers, 2,450 were "in pastoral work," and 1,263 were "not in pastoral work." The foreign missionaries are not included in the enumeration of ministers. Whole number of baptisms during the year, 5,560 of adults, and 4,309 of infants; number of additions by profession of faith, 11,311; number of families in the churches, 195,748; number of persons in Sunday-schools, 447,413. Total amount of benevolent contributions, \$1,227,108; amount of contributions for home expenditures, \$2,810,333.

The seven theological seminaries—Andover, Mass.; Bangor, Me.; Chicago, Ill.; Hartford, Conn.; Oberlin, Ohio; Oakland, Cal. (Pacific), and New Haven, Conn. (Yale)—returned for 1881, 32 professors, 27 lecturers, 13 resident licentiates, 21 members of graduating classes, and a total of 275 students.

**AMERICAN CONGREGATIONAL BENEVOLENT SOCIETIES.**—The annual meeting of the *American Congregational Union* was held in New York city, May 11th. The receipts of the society for the year had been \$51,322, or \$7,599 more than those of the previous year. Pledges of aid had been made to 103 churches and grants to 72 churches, the whole amounting to \$45,135. It was stated that three fourths of the Congregational churches in the United States had made no contribution to the Union.

The second anniversary of the *New West Educational Commission* was held in Chicago, Ill., in May. The income of the society for the year had been \$84,716, and it had a balance in the treasury of \$311. The schools under its care were represented as being well attended, especially those in Utah; and the academies at Salt Lake City, Utah; Albuquerque and Las Vegas, N. M.; and Trinidad, Col., had been prosperous. Of the eleven common schools, all of which were in Utah, six had been started during the year. They were attended by Mormons, "apostates," and "Gentiles."

The annual meeting of the *American Home Missionary Society* was held in the city of New York, May 10th. The receipts of the society for the year had been \$340,778, a sum in excess of the receipts of any previous year. A balance in the treasury of \$27,935 was reported. One thousand and seventy missionaries and superintendents had been employed, 38 more than in the previous year. Reports suggesting modifications in the constitution and administration of the society were presented by committees which had been appointed at a previous meeting, and by the Triennial Council of Congregational Churches in the United States, and were received with considerable differences of opinion. They were referred to a new committee of nine persons, which was directed to consider and report upon their provisions so far as they relate to constitutional changes; to report at the next annual meeting of the society any amendments to the constitution which it may think fit to recommend; and to publish its report in the denominational papers before September, 1882.

The annual meeting of the *American Missionary Association* was held in Cleveland, Ohio, October 24th, 25th, and 26th. The Hon. William B. Washburn, of Massachusetts, presided. The total receipts of the Association for the year had been \$298,103, and the expenditures had been \$297,313. Of the expenditures \$230,733 had been applied to the work in the South, \$12,454 to that among the Chinese, \$2,020 to that among the Indians, and \$16,801 to the foreign mission. Fifty-seven schools

were conducted in the Southern States, including eight chartered institutions, eleven high and normal schools, and 38 common schools, in which 241 teachers were employed. The whole number of students was 9,608, or 500 more than were returned in the previous year. Of the students, 72 were in the theological, 28 in the law, 104 in the collegiate, 139 in the preparatory, 2,542 in the normal, 1,103 in the grammar, 2,185 in the intermediate, and 3,481 in the primary departments. Several good and commodious new buildings had been erected in connection with the schools. The classes were open to white and colored persons, and to pupils of both sexes. The attendance of white pupils was increasing, as the prejudice against association with colored students yielded to the appreciation of the advantages of the instruction given by the schools. Eighty churches, having 5,641 members, were sustained in the Southern States; nine hundred members had been added to these churches by profession during the year; and they had raised \$9,306 for church purposes, and contributed \$1,496 to benevolent objects. Six new churches had been organized during the year. In connection with the Mendi mission in West Africa measures had been pressed to introduce a steamer upon the waters of the country for the benefit of the mission and the advantage of the people. An expedition had been sent to the upper Nile, preparatory to locating a new mission with the funds to be applied in connection with the contribution of Mr. John Arthington, of Leeds, England, for that purpose. The agents of the society in this expedition had decided to recommend Khartoom as the base of operation for the proposed mission, but the disturbances from which Egypt had been suffering had prevented any further action being taken in this matter. Missions among the Indians had been carried on at Northfield, Mich.; Cass Lake and Red Lake, Minn.; and Skokomish, Fort Berthold, and Sisseton, in the Territories; and 89 Indians of both sexes had been under instruction at the Hampton Institute, Virginia. Five missions were conducted and fifteen schools were taught among the Chinese at different places in California. The whole number of pupils in the schools was 2,567, 935 more than in the previous year, of whom 156 had ceased from idolatry and 106 had become Christians. New missions were contemplated at San Francisco (an additional one), Los Angeles, where the first mission of the Association was established, and Chicó; the Association was represented on the Pacific coast by its auxiliary, the California Chinese mission. Application had been made to the Association to establish a mission at Hong-Kong, China; but as this society had adopted a policy of not extending its foreign missions, the committee had proposed to the American Board that it undertake that work. The Association was preparing to withdraw entirely from the foreign-mission work, and to that end was ready

to surrender its Mendi mission to the American Board or to the United Brethren (who have a mission in the same region), and the proposed mission on the upper Nile to the American Board or to the United Presbyterian Church in North America as a branch of its mission in Egypt.

The seventy-third annual meeting of the *American Board of Commissioners for Foreign Missions* was held in Portland, Maine, beginning October 3d. The Rev. Mark Hopkins, D. D., LL. D., presided. The total receipts of the board for the year had been \$651,976. The general permanent fund amounted to \$162,947, and the permanent fund for officers to \$59,108. During four years, \$778,928 of the legacy which had been left to the board by Asa Otis had been expended on new missions and for educational and evangelistic purposes, \$189,705 (included in the statement of receipts) having been drawn from it during the past year. The following general summary of the work of the board was presented:

Missions.....	20
Stations.....	84
Out-stations.....	708
Ordained missionaries (five physicians).....	164
Physicians not ordained.....	10
Other male assistants.....	10
Other female assistants.....	272
Whole number of laborers sent from this country.....	456
Native pastors.....	148
Native preachers and catechists.....	488
Native school-teachers.....	1,055
Other native helpers.....	271—1,912
Whole number of laborers connected with the missions.....	2,868
Pages printed, as far as reported.....	81,000,000
Churches.....	291
Church-members.....	19,755
Added during the year.....	1,701
High-schools, theological seminaries, and station-classes.....	63
Pupils.....	2,210
Boarding-schools for girls.....	41
Pupils.....	1,688
Common schools.....	806
Pupils.....	81,953
Whole number of pupils.....	86,865

As compared with those of the previous year, the reports showed a net increase of 26 missionaries, 23 churches, 80 native pastors and preachers, 17 high-schools and seminaries, with 1,000 students, and 1,500 pupils in common schools. Progress was reported of the efforts to establish a new mission in Umzila's kingdom, Africa. In the Western Turkey mission (Constantinople and Asia Minor), efforts were in progress to give a larger share of labor and responsibility to Armenians of real worth and ability. Such persons had been urged to assume the charge of the religious newspapers and other publications, and to co-operate with the missionaries as evangelists. At Nicomedia a joint committee of delegates from the churches was uniting heartily with the missionary in all plans and efforts for the furtherance of education and evangelization. The work of the missions in China had been carried westward into Shansi, and a new station had been opened at Tai-yuen-fu, the capital of that province. Arrangements were also in progress to estab-

lish a station at Hong-Kong, for the benefit of Chinese Christians returning from the United States and Australia. The efforts of the native Christians to help themselves were represented by contributions of more than \$80,000 for their own schools, churches, and religious literature. A transfer of the Dakota mission to the American Missionary Association was recommended by the committee having the subject of that work in charge.

**DOCTRINAL QUALIFICATIONS FOR THEOLOGICAL PROFESSORSHIPS.**—A discussion respecting the doctrinal qualifications required for a professorship in the Theological Seminary at Andover has attracted much attention. The Rev. Newman Smyth, D. D., of Quincy, Ill., was in March designated by the Faculty and Board of Trustees of the Andover Seminary as Professor of Christian Theology. The election, to be valid, required the assent also of the Board of Visitors. Dr. Smyth was the author of works on "The Religious Feeling," "Old Faiths or New Light," and "The Orthodox Theology of To-day," in which, while the Orthodox doctrines on that subject were not directly contradicted, expressions were used which seemed to leave his position in reference to the dogma of a future eternal punishment of the wicked in doubt; and to indicate that he held the attitude of an "agnostic" toward it; that he foreshadowed a period of probation in the future life; that he neither affirmed nor denied the eternal punishment of those who did not avail themselves of a second chance and repent; and that he did not wholly reject the propriety of praying for the dead. Expressions which might be construed as supporting such views, it was held, disqualified him for the position to which he had been partly invited, for among the conditions of the foundation of the professorship in question was that the person filling the chair must subscribe to the belief that, "being morally incapable of recovering the image of his Creator, which was lost in Adam, every man is justly exposed to eternal damnation; . . . that the wicked will awake to shame and everlasting contempt." It was urged, on the other hand, that Dr. Smyth was a minister in good standing in the Presbyterian Church, and that the conditions of the foundation of the professors' chairs in the seminary had usually been given a liberality of construction with which the expressions objected to were not in conflict. The Board of Visitors refused to concur in the appointment of Dr. Smyth. They based their rejection, however, not on the character of his theological views, which, after hearing his statement of them, they said were "in general harmony with those which have been identified with the history of the Andover Seminary from the beginning," but upon the want of precision and definiteness of statement and of thoroughness of thought in his writings, which indicate "a way of looking at theological questions not hopeful for the success of a theological teacher."

**BRITISH CONGREGATIONALISTS.**—The English "Congregational Year-Book" for 1882 gives lists of 4,397 churches and 899 mission-stations in Great Britain and Ireland, and 589 churches in the colonies, not including the churches sustained by the London Missionary Society in heathen lands.

The receipts of the *London Missionary Society*, for the year ending with the anniversary of 1882, were £116,012. The society employed 156 missionaries, of whom 14 were women, in its missions in South and Central Africa, Madagascar, India, China, the South-Sea Islands, New Guinea, and the West Indies. The missionary force in Central Africa (at Lake Tanganyika) had been enlarged, and the forces in India and China were to be enlarged. Missions had been planted at two points in New Guinea, and a substantial beginning had been made at Port Moresby.

The annual meeting of the *Congregational Union of England and Wales* was held May 1st, under the presidency of the Rev. Dr. Macfadyen. The Rev. Dr. Fairbairn was chosen president for the ensuing year. The income of the Union for the year had been £10,410, and it had a balance from the publication account of £1,436. The report of the transactions of the year, presented by the Jubilee Committee, stated that instead of the usual Congregational lecture there had been substituted a series of special Jubilee lectures (in view of the movement for the collection of a Jubilee fund), the purpose of which was to promote a knowledge of Congregational principles and history. Conferences on the amendment of the laws relating to marriages in non-conformist places of worship had been held, and had resulted in action of the Autumnal Assembly of the previous year demanding certain amendments of the law; a special committee had been appointed to deal with the subject of middle-class education, and was at work investigating it. A scheme had been prepared, in accordance with a memorial from members of the Universities of Oxford and Cambridge, for the delivery of an experimental course of six lectures in each of those towns, in which the Baptist Union was expected to co-operate. Two boards of education—one for the northern and one for the southern colleges—had been appointed to consider respecting modifications of the college system. A special committee had been appointed in response to communications received from the native churches of Jamaica, to give to them, for a limited period, the aid which they had heretofore received from the London Missionary Society; but which could not be continued to them in that shape, because those churches could not any longer be regarded as heathen. A special report was made concerning the "Jubilee fund" of £250,000 which the Union had undertaken to raise for purposes commemorative of the completion of the fiftieth year of its organized existence. The fund now amounted, in money and promises, to £152,000.

CONGRESS, UNITED STATES. The first session of the Forty-seventh Congress commenced on December 5, 1881. (For the President's message, see "Annual Cyclopædia," 1881, "Public Documents.") In the Senate, David Davis, Senator from Illinois, took the chair. In the House of Representatives, Joseph Warren Keifer, a representative from Ohio, was chosen Speaker.

The following is a list of members:

## SENATE.

<i>Alabama.</i>	<i>Arkansas.</i>
1883, John T. Morgan, D.	1883, A. H. Garland, D.

The compensation of the President of the Senate and of the Speaker of the House is \$8,000 a year; of the Senators, Representatives, and Delegates, \$5,000 a year. Mileage is allowed at the rate of twenty cents a mile; and there is an allowance of \$250 for the Congress, for stationery and newspapers.

NEW YORK SENATORIAL ELECTION.—Mr. Hill, of Georgia: "I am instructed by the Committee on Privileges and Elections to report back to the Senate certain memorials from members of the Legislature of New York affecting the right of the present Senators from that State to occupy seats in this chamber, and to ask that the memorials lie on the table and

\* In place of Nelson W. Aldrich, elected U. S. Senator.  
 † Elected June 9, 1881, in place of M. P. O'Connor, died April 26, 1881.

the committee be discharged from their further consideration.

"In deference to the memorialists, and at the special request of some of them, it is proper that I should state briefly and generally the reasons which authorize this conclusion.

"The memorials set forth five reasons as grounds why these gentlemen should not be allowed to sit here. The first alleges that the Legislature did not proceed in separate bodies to vote upon the question until the third Tuesday after notice of the vacancy was communicated by the Governor. The facts are such as to create some controversy as to whether they did proceed on the second Tuesday or the third Tuesday after the notice; but, in any view, the committee are unanimously of the opinion that the Legislature was not deprived of its constitutional right to elect Senators to this body.

"The second allegation is that at one of the joint sessions of the General Assembly a quorum of the State Senators was not present. It is not alleged that there was not a quorum present of each body on the days the respective elections took place; but it is alleged or claimed that under the act of 1866 the failure of either body to be present with a quorum on any day deprives the Legislature of the right to elect. The committee differ with the memorialists in that view. We think that one body of the Legislature could not deprive the Legislature of the right to elect by such absence, if unquestionably on the day of election a quorum of each body of the Legislature was present and voting. We think the reason alleged in this ground is not sufficient to invalidate the election.

"The third ground alleged is that there was not a majority of the whole Legislature actually voting for the members chosen. In our opinion that is not necessary. There was a quorum of each House present in the joint assembly; there was a majority of that quorum actually voting for the members chosen. In our opinion that was a valid election.

"It is alleged specifically in the memorial that the Stockton case is a precedent to the contrary. On examination it will be found that the Stockton case is not a precedent to the contrary. Mr. Stockton, of New Jersey, in the celebrated case so well known, was chosen, not by a majority, but he was chosen by a plurality vote, the Legislature in joint session having declared before the election that a plurality should elect. The Senators now occupying the seats in question, from New York, were not chosen by a plurality vote; they were each chosen by a majority, a quorum of each body being present, and a majority of the joint assembly voting. I will state that, if the cases from New York were like the case from New Jersey, I do not think at this day any gentleman would regard the Stockton case as a precedent. Unquestionably the body that elects has a right to prescribe that a plurality may elect, and I think the report made by Senator

Trumbull on that occasion is not only correct, but conclusive of the law of the case. The committee, therefore, are of the opinion that that ground is not sufficient to invalidate the election.

"The fourth ground relates to Hon. W. Miller, and alleges that he is guilty of certain conduct in violation of section 1,781 and section 1,782 of the Revised Statutes, which disqualify a member from holding any office of honor, trust, or profit under the United States Government. It is sufficient to say that the Senator from New York has never been convicted of a violation of those sections of the Revised Statutes, and a simple inspection of the sections shows that it is conviction that disqualifies, and not allegations by outsiders or third persons who do not prosecute. Therefore the committee overrule that ground, and think it insufficient, conceding the facts alleged to be true for argument; we do not know anything about them.

"The last ground is one of fact. Before I have alluded to what are called legal grounds or allegations that by legal operation the election is void. The last ground alleges that there were rumors of bribery in procuring the election of these gentlemen. The allegation of mere rumors of bribery is not sufficient, unaccompanied with evidence, to require investigation at the hands of the Senate or of its committees. It is alleged in this memorial that one State Senator of New York is under indictment in that State for offering a bribe to a member of the House to vote in the senatorial election. It is due to the Senators holding the seats that the committee should say that that indictment is not for a bribe offered to vote for either one of the present Senators. It is due also to state, that while we find by reports that have been sent to us and investigations had, that there were a great many scandals in connection with the senatorial election in New York during the late session of the Legislature, most of these scandals occurred before the two gentlemen now holding seats became even candidates before that body.

"Therefore, sir, the committee, without going further into details, hold that the respective grounds alleged, and all of them together, are not sufficient to authorize further investigation, and do not make a case invalidating the election of the Senators from New York. We believe, from all that is before us, that the elections were valid and ought to be so declared."

THE GARFIELD MEMORIAL.—In the Senate, on December 5th, Senator John Sherman, of Ohio, offered the following resolution:

*Resolved*, That a committee of six Senators be appointed on the part of the Senate, to join such committee as may be appointed on the part of the House, to consider and report by what token of respect and affection it may be proper for the Congress of the United States to express the deep sensibility of the nation to the event of the decease of the late President, James A. Garfield, and that so much of the message of the President as relates to that melancholy event be referred to said committee.

The resolution was adopted, without debate, on the next day. At the same time, a similar resolution, appointing a committee of one member from each State, was adopted by the House.

The committee appointed on the part of the Senate consisted of Messrs. Sherman, of Ohio; Pendleton, of Ohio; Dawes, of Massachusetts; Lapham, of New York; Bayard, of Delaware; and Morgan, of Alabama, to whom Mr. Conger, of Michigan, and Mr. Brown, of Georgia, were subsequently added.

The committee appointed on the part of the House consisted of the following members: William McKinley, Jr., of Ohio; Romualdo Pacheco, of California; James B. Belford, of Colorado; John T. Wait, of Connecticut; William H. Forney, of Alabama; Poindexter Dunn, of Arkansas; Edward L. Martin, of Delaware; Robert H. M. Davidson, of Florida; Alexander H. Stephens, of Georgia; Joseph G. Cannon, of Illinois; Godlove S. Orth, of Indiana; John A. Kasson, of Iowa; John A. Anderson, of Kansas; John G. Carlisle, of Kentucky; Randall L. Gibson, of Louisiana; Nelson Dingley, Jr., of Maine; Robert M. McLane, of Maryland; Benjamin W. Harris, of Massachusetts; Roswell G. Hoar, of Michigan; Mark H. Dunnell, of Minnesota; Charles E. Hooker, of Mississippi; Nicholas Ford, of Missouri; Edward K. Valentine, of Nebraska; George W. Cassidy, of Nevada; Joshua G. Hall, of New Hampshire; John Hill, of New Jersey; Samuel S. Cox, of New York; Robert B. Vance, of North Carolina; M. C. George, of Oregon; Charles O'Neill, of Pennsylvania; Jonathan Chace, of Rhode Island; D. Wyatt Aiken, of South Carolina; A. H. Pettibone, of Tennessee; Roger Q. Mills, of Texas; Charles H. Joyee, of Vermont; J. Randolph Tucker, of Virginia; Benjamin Wilson, of West Virginia; and Charles G. Williams, of Wisconsin.

On December 21st the committee reported as follows:

*Whereas*, The melancholy event of the violent and tragic death of James Abram Garfield, late President of the United States, having occurred during the recess of Congress, and the two Houses sharing in the general grief, and desiring to manifest their sensibility upon the occasion of the public bereavement: Therefore,

*Be it resolved by the House of Representatives (the Senate concurring)*, That the two Houses of Congress will assemble in the hall of the House of Representatives on a day and hour to be fixed and announced by the joint committee, and that in the presence of the two Houses there assembled, an address upon the life and character of James Abram Garfield, late President of the United States, be pronounced by Hon. James G. Blaine; and that the President of the Senate *pro tempore*, and the Speaker of the House of Representatives, be requested to invite the President and ex-Presidents of the United States, the heads of the several Departments, the judges of the Supreme Court, the representatives of the foreign governments near this Government, the Governors of the several States, the General of the Army and the Admiral of the Navy, and such officers of the Army and Navy as have received the thanks of Congress, who may then be at the seat of government, to be present on the occasion.

*And be it further resolved*, That the President of the United States be requested to transmit a copy of these resolutions to Mrs. Lucretia R. Garfield, and to assure her of the profound sympathy of the two Houses of Congress for her deep personal affliction, and of their sincere condolence for the late national bereavement.

The preamble and resolutions were adopted.

Subsequently a concurrent resolution was adopted to set apart Monday, February 27th, for the memorial services above mentioned.

In the House, on February 27th, the Speaker said: "This day has been dedicated by the action of the two Houses of Congress to services in commemoration of the life and death of James Abram Garfield, late President of the United States. This action was taken through the adoption of concurrent resolutions by the unanimous vote of the two Houses, presented by a select joint committee appointed 'to consider and report by what token of respect, esteem, and affection it may be proper for Congress to express its and the nation's deep sensibility over the event of the decease of our late President.'"

"The House is now assembled and ready to perform its part in the solemn duty."

The following programme of arrangements, prepared by the joint committee of both Houses, was carried out:

#### PROGRAMME OF ARRANGEMENTS.

The Capitol will be closed on the morning of the 27th to all except the members and officers of Congress.

At ten o'clock the east door leading to the Rotunda will be opened to those to whom invitations have been extended under the joint resolution of Congress by the presiding officers of the two Houses, and to those holding tickets of admission to the galleries.

The hall of the House of Representatives will be opened for the admission of Representatives and to those who have invitations, who will be conducted to the seats assigned to them, as follows:

The President and ex-Presidents of the United States, and special guests, will be seated in front of the Speaker.

The Chief-Justice and associate justices of the Supreme Court will occupy seats next to the President and ex-Presidents, and special guests, on the right of the Speaker.

The Cabinet officers, the General of the Army and Admiral of the Navy, and the officers of the Army and Navy who, by name, have received the thanks of Congress, will occupy seats on the left of the Speaker.

The Chief-Justice and judges of the Court of Claims, and the Chief Justice and associate justices of the Supreme Court of the District of Columbia, will occupy seats directly in the rear of the Supreme Court.

The diplomatic corps will occupy the front row of seats.

Ex-Vice-Presidents, Senators, and ex-Senators, will occupy seats in the second, third, fourth, and fifth rows, on east side of main aisle.

Representatives will occupy seats on west side of main aisle, and in rear of the Senators on east side.

Commissioners of the District, Governors of States and Territories, assistant heads of Departments, and invited guests, will occupy seats in rear of Representatives.

The Executive gallery will be reserved exclusively for the families of the Supreme Court, and the families of the Cabinet, and the invited guests of the Pres-

ident. Tickets thereto will be delivered to the Private Secretary of the President.

The diplomatic gallery will be reserved exclusively for the families of the members of the diplomatic corps. Tickets thereto will be delivered to the Secretary of State.

The reporters' gallery will be reserved exclusively for the use of the reporters for the press. Tickets thereto will be delivered to the press committee.

The official reporters of the Senate and of the House will occupy the reporters' desk in front of the Clerk's table.

The House of Representatives will be called to order by the Speaker at twelve o'clock.

The Marine Band will be in attendance.

The Senate will assemble at twelve o'clock, and immediately after prayer will proceed to the hall of the House of Representatives.

The diplomatic corps will meet at half past eleven o'clock in Representatives' lobby, and be conducted by the Sergeant-at-Arms of the House to the seats assigned them.

The President of the Senate will occupy the Speaker's chair.

The Speaker of the House will occupy a seat at the left of the President of the Senate.

The Chaplains of the Senate and of the House will occupy seats next to the presiding officers of their respective Houses.

The chairmen of the joint committee of arrangements will occupy seats at the right and left of the orator, and next to them will be seated the Secretary of the Senate and the Clerk of the House.

The other officers of the Senate and of the House will occupy seats on the floor, at the right and the left of the Speaker's platform.

Prayer will be offered by the Rev. F. D. Power, Chaplain of the House of Representatives.

The presiding officer will then present the orator of the day.

The benediction will be pronounced by the Rev. J. J. Bullock, Chaplain of the Senate.

By reason of the limited capacity of the galleries the number of tickets is necessarily restricted, and will be distributed as follows:

To each Senator, Representative, and Delegate, three tickets.

No person will be admitted to the Capitol except on presentation of a ticket, which will be good only for the place indicated.

The Architect of the Capitol and the Sergeant-at-Arms of the Senate and Sergeant-at-Arms of the House are charged with the execution of these arrangements.

JOHN SHERMAN,

WM. McKINLEY, Jr.,

Chairmen Joint Committee.

The President *pro tempore* of the Senate called the two Houses to order.

Rev. F. D. Power, Chaplain of the House of Representatives, offered prayer, as follows:

#### PRAYER.

O Lord our God, we thank thee for this hour and for this service. We thank thee for a great life given to this nation; for its genius and potencies; for its example and memories; for its immortality and eternity. May this republic never forget its dead!

As we come together this day to recall the wisdom, the integrity, the statesmanship, the loyalty, the reverence for thee and thy word, the unselfish love for country and for all mankind, wherewith thou didst endow thy servant and fit him for the administration of the affairs of the Government; as we meditate upon the patience, the sweetness, the fortitude, the faith, the quiet resignation to thy will wherewith thou didst fit him for his sore trial; as we remember his triumph and our sorrow, grant us thy gracious benediction.

We bear, during this memorial service, our Father,

before thee, on our hearts, his loved ones with whom we weep. Sustain, we beseech thee, the mother who bore him. May the peace of God that passeth all understanding be the strength and the crown of her spirit. Be very merciful to the wife in her present separation from the husband of her youth. May she rest in God, and may she find such sympathy and joy in her Saviour as the world can not give nor take away. Be a father to the children now fatherless, and may they imitate the virtues of their illustrious parent, and like him be useful in living and mourned in dying. May the youth of this land and of all lands feel the power of his example and follow in his footsteps. May those who rule among us and among men everywhere by the study of his virtues be incited to like patriotism and piety.

Now we ask thy blessing on this assembly. May the remembrance of this great life be a genuine help to all those present and that greater audience waiting without. Give grace and utterance to thy servant who shall speak to us. May his words be wise and worthy and fitly chosen, like apples of gold in pictures of silver.

Remember thy servant before thee, the President of the United States. Preserve him from evil influences and evil men. May truth rest upon his brow, wisdom upon his lips, justice in his hands, and grace in his heart. Bless his counselors, this Congress assembled, our magistrates and judges, our Army and Navy, our schools and churches, our whole land and all the inhabitants thereof.

May we keep alive in us the faith and virtue of those who have passed before. Give peace in our time. Make religion and righteousness, truth and justice, knowledge and freedom to abound everywhere. May thy name be glorified and thy kingdom rule over us from sea to sea.

We ask it all reverently, through Jesus Christ our Lord. Amen.

The President *pro tempore* of the Senate: "Senators and Representatives, this day is dedicated by Congress for memorial services upon the late President James A. Garfield. I present to you Hon. James G. Blaine, who has been fitly chosen as the orator for this historical occasion."

Mr. Blaine (who was greeted with hearty applause) delivered the following oration:

#### ORATION.

"Mr. President: For the second time in this generation the great departments of the Government of the United States are assembled in the hall of Representatives to do honor to the memory of a murdered President. Lincoln fell at the close of a mighty struggle in which the passions of men had been deeply stirred. The tragical termination of his great life added but another to the lengthened succession of horrors which had marked so many lintels with the blood of the first-born. Garfield was slain in a day of peace, when brother had been reconciled to brother, and when anger and hate had been banished from the land. 'Whoever shall hereafter draw the portrait of murder, if he will show it as it has been exhibited where such example was last to have been looked for, let him not give it the grim visage of Moloch, the brow knitted by revenge, the face black with settled hate. Let him draw, rather, a decorous, smooth-faced, bloodless demon; not so much an example of human nature in its depravity and in its paroxysms of crime, as an infernal being, a fiend in the ordinary display and development of his character.'

"From the landing of the Pilgrims at Plymouth till the uprising against Charles I, about twenty thousand emigrants came from Old England to New England. As they came in pursuit of intellectual freedom and ecclesiastical independence rather than for worldly honor and profit, the emigration naturally ceased

when the contest for religious liberty began in earnest at home. The man who struck his most effective blow for freedom of conscience by sailing for the colonies in 1620 would have been accounted a deserter to leave after 1640. The opportunity had then come on the soil of England for that great contest which established the authority of Parliament, gave religious freedom to the people, sent Charles to the block, and committed to the hands of Oliver Cromwell the supreme executive authority of England. The English emigration was never renewed, and from these twenty thousand men, with a small emigration from Scotland and from France, are descended the vast numbers who have New England blood in their veins.

"In 1685 the revocation of the Edict of Nantes by Louis XIV scattered to other countries four hundred thousand Protestants, who were among the most intelligent and enterprising of French subjects—merchants of capital, skilled manufacturers, and handicraftsmen, superior at the time to all others in Europe. A considerable number of these Huguenot French came to America; a few landed in New England and became honorably prominent in its history. Their names have in large part become anglicized, or have disappeared, but their blood is traceable in many of the most reputable families, and their fame is perpetuated in honorable memorials and useful institutions."

#### ANCESTORS.

"From these two sources, the English-Puritan and the French-Huguenot, came the late President—his father, Abram Garfield, being descended from the one, and his mother, Eliza Ballou, from the other.

"It was good stock on both sides—none better, none braver, none truer. There was in it an inheritance of courage, of manliness, of imperishable love of liberty, of undying adherence to principle. Garfield was proud of his blood; and with as much satisfaction as if he were a British nobleman reading his stately ancestral record in Burke's 'Peerage,' he spoke of himself as ninth in descent from those who would not endure the oppression of the Stuarts, and seventh in descent from the brave French Protestants who refused to submit to tyranny even from the Grand Monarque.

"General Garfield delighted to dwell on these traits, and, during his only visit to England, he busied himself in discovering every trace of his forefathers in parish registries and on ancient army rolls. Sitting with a friend in the gallery of the House of Commons, one night, after a long day's labor in this field of research, he said, with evident elation, that in every war in which for three centuries patriots of English blood had struck sturdy blows for constitutional government and human liberty, his family had been represented. They were at Marston Moor, at Naseby, and at Preston; they were at Bunker Hill, at Saratoga, and at Monmouth, and in his own person had battled for the same great cause in the war which preserved the Union of the States."

#### EARLY AGE.

"Losing his father before he was two years old, the early life of Garfield was one of privation, but its poverty has been made indelicately and unjustly prominent. Thousands of readers have imagined him as the ragged, starving child, whose reality too often greets the eye in the squalid sections of our large cities. General Garfield's infancy and youth had none of their destitution, none of their pitiful features appealing to the tender heart and to the open hand of charity. He was a poor boy in the same sense in which Henry Clay was a poor boy; in which Andrew Jackson was a poor boy; in which Daniel Webster was a poor boy; in the sense in which a large majority of the eminent men of America in all generations have been poor boys. Before a great multitude of men, in a public speech, Mr. Webster bore this testimony:

It did not happen to me to be born in a log-cabin, but my elder brothers and sisters were born in a log-cabin raised amid the snow-drifts of New Hampshire, at a period so early that when the smoke rose first from its rude chimney and curled

over the frozen hills there was no similar evidence of a white man's habitation between it and the settlements on the rivers of Canada. Its remains still exist. I make it to it an annual visit. I carry my children to it to teach them the hardships endured by the generations which have gone before them. I love to dwell on the tender recollections, the kindred ties, the early affections, and the touching narratives and incidents which mingle with all I know of this primitive family abode.

"With the requisite change of scene the same words would aptly portray the early days of Garfield. The poverty of the frontier, where all are engaged in a common struggle and where a common sympathy and hearty co-operation lighten the burdens of each, is a very different poverty, different in kind, different in influence and effect from that conscious and humiliating indigence which is every day forced to contrast itself with neighboring wealth on which it feels a sense of grinding dependence. The poverty of the frontier is indeed no poverty. It is but the beginning of wealth, and has the boundless possibilities of the future always opening before it. No man ever grew up in the agricultural regions of the West where a house-raising, or even a corn-husking, is matter of common interest and helpfulness, with any other feeling than that of broad-minded, generous independence. This honorable independence marked the youth of Garfield as it marks the youth of millions of the best blood and brain now training for the future citizenship and future government of the republic. Garfield was born heir to land, to the title of freeholder, which has been the patent and passport of self-respect with the Anglo-Saxon race ever since Hengist and Horsa landed on the shores of England. His adventure on the canal—an alternative between that and the deck of a Lake Erie schooner—was a farmer's boy's device for earning money, just as the New England lad begins a possibly great career by sailing before the mast on a coasting-vessel or on a merchantman bound to the farther India or to the China seas.

"No manly man feels anything of shame in looking back to early struggles with adverse circumstances, and no man feels a worthier pride than when he has conquered the obstacles to his progress. But no one of noble mold desires to be looked upon as having occupied a menial position, as having been repressed by a feeling of inferiority, or as having suffered the evils of poverty until relief was found at the hand of charity. General Garfield's youth presented no hardships which family love and family energy did not overcome, subjected him to no privations which he did not cheerfully accept, and left no memories save those which were recalled with delight, and transmitted with profit and with pride."

#### EDUCATION.

"Garfield's early opportunities for securing an education were extremely limited, and yet were sufficient to develop in him an intense desire to learn. He could read at three years of age, and each winter he had the advantage of the district school. He read all the books to be found within the circle of his acquaintance; some of them he got by heart. While yet in childhood he was a constant student of the Bible, and became familiar with its literature. The dignity and earnestness of his speech in his maturer life gave evidence of this early training. At eighteen years of age he was able to teach school, and thenceforward his ambition was to obtain a college education. To this end he bent all his efforts, working in the harvest-field, at the carpenter's bench, and, in the winter season, teaching the common schools of the neighborhood. While thus laboriously occupied he found time to prosecute his studies, and was so successful that at twenty-two years of age he was able to enter the junior class at Williams College, then under the presidency of the venerable and honored Mark Hopkins, who, in the fullness of his powers, survives the eminent pupil to whom he was of inestimable service.

"The history of Garfield's life to this period presents no novel features. He had undoubtedly shown perseverance, self-reliance, self-sacrifice, and ambition—qualities which, be it said for the honor of our

country, are everywhere to be found among the young men of America. But from his graduation at Williams onward, to the hour of his tragical death, Garfield's career was eminent and exceptional. Slowly working through his educational period, receiving his diploma when twenty-four years of age, he seemed at one bound to spring into conspicuous and brilliant success. Within six years he was successively president of a college, State Senator of Ohio, major-general of the Army of the United States, and Representative-elect to the National Congress. A combination of honors so varied, so elevated, within a period so brief and to a man so young, is without precedent or parallel in the history of the country."

#### ARMY LIFE.

"Garfield's army life was begun with no other military knowledge than such as he had hastily gained from books in the few months preceding his march to the field. Stepping from civil life to the head of a regiment, the first order he received when ready to cross the Ohio was to assume command of a brigade, and to operate as an independent force in Eastern Kentucky. His immediate duty was to check the advance of Humphrey Marshall, who was marching down the Big Sandy with the intention of occupying, in connection with other Confederate forces, the entire territory of Kentucky, and of precipitating the State into secession. This was at the close of the year 1861. Seldom, if ever, has a young college professor been thrown into a more embarrassing and discouraging position. He knew just enough of military science, as he expressed it himself, to measure the extent of his ignorance, and with a handful of men he was marching, in rough winter weather, into a strange country, among a hostile population, to confront a largely superior force under the command of a distinguished graduate of West Point, who had seen active and important service in two preceding wars.

"The result of the campaign is matter of history. The skill, the endurance, the extraordinary energy shown by Garfield, the courage he imparted to his men, raw and untried as himself, the measures he adopted to increase his force and to create in the enemy's mind exaggerated estimates of his numbers, bore perfect fruit in the routing of Marshall, the capture of his camp, the dispersion of his force, and the emancipation of an important territory from the control of the rebellion. Coming at the close of a long series of disasters to the Union arms, Garfield's victory had an unusual and extraneous importance, and in the popular judgment elevated the young commander to the rank of a military hero. With less than two thousand men in his entire command, with a mobilized force of only eleven hundred, without cannon, he had met an army of five thousand and defeated them—driving Marshall's forces successively from two strongholds of their own selection, fortified with abundant artillery. Major-General Buell, commanding the Department of the Ohio, an experienced and able soldier of the regular Army, published an order of thanks and congratulation on the brilliant result of the Big Sandy campaign, which would have turned the head of a less cool and sensible man than Garfield. Buell declared that his services had called into action the highest qualities of a soldier, and President Lincoln supplemented these words of praise by the more substantial reward of a brigadier-general's commission, to bear date from the day of his decisive victory over Marshall.

"The subsequent military career of Garfield fully sustained its brilliant beginning. With his new commission he was assigned to the command of a brigade in the Army of the Ohio, and took part in the second and decisive day's fight in the great battle of Shiloh. The remainder of the year 1862 was not especially eventful to Garfield, as it was not to the armies with which he was serving. His practical sense was called into exercise in completing the task, assigned him by General Buell, of reconstructing bridges and re-establishing lines of railway communication for the army.

His occupation in this useful but not brilliant field was varied by service on courts-martial of importance, in which department of duty he won a valuable reputation, attracting the notice and securing the approval of the able and eminent Judge-Advocate-General of the Army. That of itself was warrant to honorable fame; for among the great men who in those trying days gave themselves, with entire devotion, to the service of their country, one who brought to that service the ripest learning, the most fervid eloquence, the most varied attainments, who labored with modesty and shunned applause, who in the day of triumph sat reserved and silent and grateful—as Francis Deak in the hour of Hungary's deliverance—was Joseph Holt, of Kentucky, who in his honorable retirement enjoys the respect and veneration of all who love the Union of the States.

"Early in 1863 Garfield was assigned to the highly important and responsible post of chief of staff to General Rosecrans, then at the head of the Army of the Cumberland. Perhaps in a great military campaign, no subordinate officer requires sounder judgment and quicker knowledge of men than the chief of staff to the commanding general. An indiscreet man in such a position can sow more discord, breed more jealousy, and disseminate more strife than any other officer in the entire organization. When General Garfield assumed his new duties he found various troubles already well developed and seriously affecting the value and efficiency of the Army of the Cumberland. The energy, the impartiality, and the tact with which he sought to allay these dissensions, and to discharge the duties of his new and trying position will always remain one of the most striking proofs of his great versatility. His military duties closed on the memorable field of Chickamauga, a field which, however disastrous to the Union arms, gave to him the occasion of winning imperishable laurels. The very rare distinction was accorded him of a great promotion for his bravery on a field that was lost. President Lincoln appointed him a major-general in the Army of the United States for gallant and meritorious conduct in the battle of Chickamauga.

"The Army of the Cumberland was reorganized under the command of General Thomas, who promptly offered Garfield one of its divisions. He was extremely desirous to accept the position, but was embarrassed by the fact that he had, a year before, been elected to Congress, and the time when he must take his seat was drawing near. He preferred to remain in the military service, and had within his own breast the largest confidence of success in the wider field which his new rank opened to him. Balancing the arguments on the one side and the other, anxious to determine what was for the best, desirous above all things to do his patriotic duty, he was decisively influenced by the advice of President Lincoln and Secretary Stanton, both of whom assured him that he could, at that time, be of especial value in the House of Representatives. He resigned his commission of major-general on the 5th day of December, 1863, and took his seat in the House of Representatives on the 7th. He had served two years and four months in the army, and had just completed his thirty-second year."

#### ELECTED TO CONGRESS.

"The Thirty-eighth Congress is pre-eminently entitled in history to the designation of the War Congress. It was elected while the war was flagrant, and every member was chosen upon the issues involved in the continuance of the struggle. The Thirty-seventh Congress had, indeed, legislated to a large extent on war measures, but it was chosen before any one believed that secession of the States would be actually attempted. The magnitude of the work which fell upon its successor was unprecedented, both in respect to the vast sums of money raised for the support of the army and navy, and of the new and extraordinary powers of legislation which it was forced to exercise. Only twenty-four States were represented, and one

hundred and eighty-two members were upon its roll. Among these were many distinguished party leaders on both sides, veterans in the public service, with established reputations for ability, and with that skill which comes only from parliamentary experience. Into this assemblage of men Garfield entered without special preparation, and it might almost be said unexpectedly. The question of taking command of a division of troops under General Thomas, or taking his seat in Congress, was kept open till the last moment, so late, indeed, that the resignation of his military commission and his appearance in the House were almost contemporaneous. He wore the uniform of a major-general of the United States Army on Saturday, and on Monday, in civilian's dress, he answered to the roll-call as a Representative in Congress from the State of Ohio.

"He was especially fortunate in the constituency which elected him. Descended almost entirely from New England stock, the men of the Ashtabula district were intensely radical on all questions relating to human rights. Well educated, thrifty, thoroughly intelligent in affairs, acutely discerning of character, not quick to bestow confidence, and slow to withdraw it, they were at once the most helpful and most exacting of supporters. Their tenacious trust in men in whom they have once confided is illustrated by the unparalleled fact that Elisha Whittlesey, Joshua R. Giddings, and James A. Garfield represented the district for fifty-four years.

"There is no test of a man's ability in any department of public life more severe than service in the House of Representatives; there is no place where so little deference is paid to reputation previously acquired, or to eminence won outside; no place where so little consideration is shown for the feelings or the failures of beginners. What a man gains in the House he gains by sheer force of his own character, and if he loses and falls back, he must expect no mercy, and will receive no sympathy. It is a field in which the survival of the strongest is the recognized rule, and where no pretense can deceive and no glamour can mislead. The real man is discovered, his worth is impartially weighed, his rank is irreversibly decreed.

"With possibly a single exception, Garfield was the youngest member in the House when he entered, and was but seven years from his college graduation. But he had not been in his seat sixty days before his ability was recognized and his place conceded. He stepped to the front with the confidence of one who belonged there. The House was crowded with strong men of both parties; nineteen of them have since been transferred to the Senate, and many of them have served with distinction in the gubernatorial chairs of their respective States, and on foreign missions of great consequence; but among them all none grew so rapidly, none so firmly, as Garfield. As is said by Trevelyan of his parliamentary hero, Garfield succeeded 'because all the world in concert could not have kept him in the background, and because, when once in the front, he played his part with a prompt intrepidity and a commanding ease that were but the outward symptoms of the immense reserves of energy on which it was in his power to draw.' Indeed, the apparently reserved force which Garfield possessed was one of his great characteristics. He never did so well but that it seemed he could easily have done better. He never expended so much strength but that he seemed to be holding additional power at call. This is one of the happiest and rarest distinctions of an effective debater, and often counts for as much in persuading an assembly as the eloquent and elaborate argument."

#### SERVICES IN THE HOUSE.

"The great measure of Garfield's fame was filled by his service in the House of Representatives. His military life, illustrated by honorable performance, and rich in promise, was, as he himself felt, prematurely terminated, and necessarily incomplete. Speculation as to what he might have done in a field where the

great prizes are so few, can not be profitable. It is sufficient to say that, as a soldier, he did his duty bravely; he did it intelligently; he won an enviable fame, and he retired from the service without blot or breath against him. As a lawyer, though admirably equipped for the profession, he can scarcely be said to have entered on its practice. The few efforts he made at the bar were distinguished by the same high order of talent which he exhibited on every field where he was put to the test; and, if a man may be accepted as a competent judge of his own capacities and adaptations, the law was the profession to which Garfield should have devoted himself. But fate ordained otherwise, and his reputation in history will rest largely upon his service in the House of Representatives. That service was exceptionally long. He was nine times consecutively chosen to the House, an honor enjoyed probably by not twenty other Representatives of the more than five thousand who have been elected from the organization of the Government to this hour.

"As a parliamentary orator, as a debater on an issue squarely joined, where the position had been chosen and the ground laid out, Garfield must be assigned a very high rank. More, perhaps, than any man with whom he was associated in public life, he gave careful and systematic study to public questions, and he came to every discussion in which he took part with elaborate and complete preparation. He was a steady and indefatigable worker. Those who imagine that talent or genius can supply the place or achieve the results of labor, will find no encouragement in Garfield's life. In preliminary work he was apt, rapid, and skillful. He possessed in a high degree the power of readily absorbing ideas and facts, and, like Dr. Johnson, had the art of getting from a book all that was of value in it, by a reading apparently so quick and cursory that it seemed like a mere glance at the table of contents. He was a pre-eminently fair and candid man in debate, took no petty advantage, stooped to no unworthy methods, avoided personal allusions, rarely appealed to prejudice, did not seek to inflame passion. He had a quicker eye for the strong point of his adversary than for his weak point; and, on his own side, he so marshaled his weighty arguments as to make his hearers forget any possible lack in the complete strength of his position. He had a habit of stating his opponent's side with such amplitude of fairness, and such liberality of concession, that his followers often complained that he was giving his case away. But never, in his prolonged participation in the proceedings of the House, did he give his case away, or fail, in the judgment of competent and impartial listeners, to gain the mastery.

"These characteristics, which marked Garfield as a great debater, did not, however, make him a great parliamentary leader. A parliamentary leader, as that term is understood wherever free representative government exists, is necessarily and very strictly the organ of his party. An ardent American defined the instinctive warmth of patriotism when he offered the toast, 'Our country, always right; but right or wrong, our country.' The parliamentary leader who has a body of followers that will do and dare and die for the cause, is one who believes his party always right, but, right or wrong, is for his party. No more important or exacting duty devolves upon him than the selection of the field and the time for contest. He must know not merely how to strike, but where to strike, and when to strike. He often skillfully avoids the strength of his opponent's position, and scatters confusion in his ranks by attacking an exposed point, when really the righteousness of the cause and the strength of logical intrenchment are against him. He conquers often both against the right and the heavy battalions; as, when young Charles Fox, in the days of his Toryism, carried the House of Commons against justice, against its immemorial rights, against his own convictions—if, indeed, at that period, Fox had convictions—and, in the interest of a corrupt administration, in obedience to a tyrannical sovereign, drove

Wilkes from the seat to which the electors of Middlesex had chosen him, and installed Luttrell, in defiance not merely of law, but of public decency. For an achievement of that kind Garfield was disqualified—disqualified by the texture of his mind, by the honesty of his heart, by his conscience, and by every instinct and aspiration of his nature.

"The three most distinguished parliamentary leaders hitherto developed in this country are Mr. Clay, Mr. Douglas, and Mr. Thaddeus Stevens. Each was a man of consummate ability, of great earnestness, of intense personality, differing widely each from the other, and yet with a single trait in common—the power to command. In the give-and-take of daily discussion, in the art of controlling and consolidating reluctant and refractory followers; in the skill to overcome all forms of opposition, and to meet, with competency and courage, the varying phases of unlooked-for assault or unsuspected defection, it would be difficult to rank with these a fourth name in all our congressional history. But of these Mr. Clay was the greatest. It would, perhaps, be impossible to find, in the parliamentary annals of the world, a parallel to Mr. Clay in 1841, when, at sixty-four years of age, he took the control of the Whig party from the President who had received their suffrages, against the power of Webster in the Cabinet, against the eloquence of Choate in the Senate, against the herculean efforts of Caleb Cushing and Henry A. Wise in the House. In unshared leadership, in the pride and plenitude of power, he hurled against John Tyler, with deepest scorn, the mass of that conquering column which had swept over the land in 1840, and drove his administration to seek shelter behind the lines of his political foes. Mr. Douglas achieved a victory scarcely less wonderful, when in 1854, against the secret desires of a strong administration, against the wise counsel of the older chiefs, against the conservative instincts and even the moral sense of the country, he forced a reluctant Congress into a repeal of the Missouri Compromise. Mr. Thaddeus Stevens, in his contests from 1865 to 1868, actually advanced his parliamentary leadership until Congress tied the hands of the President, and governed the country by its own will, leaving only perfunctory duties to be discharged by the Executive. With two hundred millions of patronage in his hands at the opening of the contest, aided by the active force of Seward in the Cabinet, and the moral power of Chase on the bench, Andrew Johnson could not command the support of one third in either House against the parliamentary uprising of which Thaddeus Stevens was the animating spirit and the unquestioned leader.

"From these three great men Garfield differed radically—differed in the quality of his mind, in temperament, in the form and phase of ambition. He could not do what they did, but he could do what they could not; and, in the breadth of his congressional work, he left that which will longer exert a potential influence among men, and which, measured by the severe test of posthumous criticism, will secure a more enduring and more enviable fame.

"Those unfamiliar with Garfield's industry, and ignorant of the details of his work, may, in some degree, measure them by the annals of Congress. No one of the generation of public men to which he belonged has contributed so much that will be valuable for future reference. His speeches are numerous, many of them brilliant, all of them well studied, carefully phrased, and exhaustive of the subject under consideration. Collected from the scattered pages of ninety royal-octavo volumes of congressional record, they would present an invaluable compendium of the political history of the most important era through which the National Government has ever passed. When the history of this period shall be impartially written, when war legislation, measures of reconstruction, protection of human rights, amendments to the Constitution, maintenance of public credit, steps toward specie resumption, true theories of revenue may be reviewed, unsurrounded by prejudice, and disconnected from

partisanism, the speeches of Garfield will be estimated at their true value, and will be found to comprise a vast magazine of fact and argument, of clear analysis and sound conclusion. Indeed, if no other authority were accessible, his speeches in the House of Representatives, from December, 1863, to June, 1880, would give a well-connected history, and complete defense of the important legislation of the seventeen eventful years that constitute his parliamentary life. Far beyond that, his speeches would be found to forecast many great measures yet to be completed—measures which he knew were beyond the public opinion of the hour, but which he confidently believed would secure popular approval within the period of his own lifetime, and by the aid of his own efforts.

"Differing, as Garfield does, from the brilliant parliamentary leaders, it is not easy to find his counterpart anywhere in the record of American public life. He, perhaps, more nearly resembles Mr. Seward in his supreme faith in the all-conquering power of a principle. He had the love of learning, and the patient industry of investigation, to which John Quincy Adams owes his prominence and his presidency. He had some of those ponderous elements of mind which distinguished Mr. Webster, and which, indeed, in all our public life have left the great Massachusetts Senator without an intellectual peer.

"In English parliamentary history, as in our own, the leaders in the House of Commons present points of essential difference from Garfield. But some of his methods recall the best features in the strong, independent course of Sir Robert Peel, and striking resemblances are discernible in that most promising of modern Conservatives, who died too early for his country and his fame, the Lord George Bentinck. He had all of Burke's love for the sublime and the beautiful, with, possibly, something of his superabundance; and in his faith and his magnanimity, in his power of statement, in his subtle analysis, in his faultless logic, in his love of literature, in his wealth and world of illustration, one is reminded of that great English statesman of to-day, who, confronted with obstacles that would daunt any but the dauntless, reviled by those whom he would relieve as bitterly as by those whose supposed rights he is forced to invade, still labors with serene courage for the amelioration of Ireland and for the honor of the English name."

#### NOMINATION FOR PRESIDENCY.

"Garfield's nomination to the presidency, while not predicted or anticipated, was not a surprise to the country. His prominence in Congress, his solid qualities, his wide reputation, strengthened by his then recent election as Senator from Ohio, kept him in the public eye as a man occupying the very highest rank among those entitled to be called statesmen. It was not mere chance that brought him this high honor. 'We must,' says Mr. Emerson, 'reckon success a constitutional trait. If Eric is in robust health and has slept well and is at the top of his condition, and thirty years old at his departure from Greenland, he will steer west and his ships will reach Newfoundland. But take Eric out and put in a stronger and bolder man and the ships will sail six hundred, one thousand, fifteen hundred miles farther and reach Labrador and New England. There is no chance in results.'

"As a candidate, Garfield steadily grew in popular favor. He was met with a storm of detraction at the very hour of his nomination, and it continued with increasing volume and momentum until the close of his victorious campaign:

'No might nor greatness in mortality  
Can censure 'scape; backwounding calumny  
The whitest virtue strikes. What king so strong  
Can tie the gall up in the slanderous tongue?'

"Under it all he was calm, and strong, and confident; never lost his self-possession, did no unwise act, spoke no hasty or ill-considered word. Indeed, nothing in his whole life is more remarkable or more

creditable than his bearing through those five full months of vituperation—a prolonged agony of trial to a sensitive man, a constant and cruel draft upon the powers of moral endurance. The great mass of these unjust imputations passed unnoticed, and with the general *debris* of the campaign fell into oblivion. But in a few instances the iron entered his soul, and he died with the injury unforgetten if not unforgiven.

"One aspect of Garfield's candidacy was unprecedented. Never before, in the history of partisan contests in this country, had a successful presidential candidate spoken freely on passing events and current issues. To attempt anything of the kind seemed novel, rash, and even desperate. The older class of voters recalled the unfortunate Alabama letter, in which Mr. Clay was supposed to have signed his political death-warrant. They remembered also the hot-tempered effusion by which General Scott lost a large share of his popularity before his nomination, and the unfortunate speeches which rapidly consumed the remainder. The younger voters had seen Mr. Greeley in a series of vigorous and original addresses preparing the pathway for his own defeat. Unmindful of these warnings, unheeding the advice of friends, Garfield spoke to large crowds as he journeyed to and from New York in August, to a great multitude in that city, to delegations and deputations of every kind that called at Mentor during the summer and autumn. With innumerable critics, watchful and eager to catch a phrase that might be turned into odium or ridicule, or a sentence that might be distorted to his own or his party's injury, Garfield did not trip or halt in any one of his seventy speeches. This seems all the more remarkable when it is remembered that he did not write what he said, and yet spoke with such logical consecutiveness of thought and such admirable precision of phrase as to defy the accident of misreport and the malignity of misrepresentation."

#### AS PRESIDENT.

"In the beginning of his presidential life, Garfield's experience did not yield him pleasure or satisfaction. The duties that engross so large a portion of the President's time were distasteful to him, and were unfavorably contrasted with his legislative work. 'I have been dealing all these years with ideas,' he impatiently exclaimed one day, 'and here I am dealing only with persons. I have been heretofore treating of the fundamental principles of government, and here I am considering all day whether A or B shall be appointed to this or that office.' He was earnestly seeking some practical way of correcting the evils arising from the distribution of overgrown and unwieldy patronage—evils always appreciated and often discussed by him, but whose magnitude had been more deeply impressed upon his mind since his accession to the presidency. Had he lived, a comprehensive improvement in the mode of appointment and in the tenure of office would have been proposed by him, and with the aid of Congress no doubt perfected.

"But, while many of the Executive duties were not grateful to him, he was assiduous and conscientious in their discharge. From the very outset he exhibited administrative talent of a high order. He grasped the helm of office with the hand of a master. In this respect, indeed, he constantly surprised many who were most intimately associated with him in the Government, and especially those who had feared that he might be lacking in the executive faculty. His disposition of business was orderly and rapid. His power of analysis, and his skill in classification, enabled him to dispatch a vast mass of detail with singular promptness and ease. His Cabinet meetings were admirably conducted. His clear presentation of official subjects, his well-considered suggestion of topics on which discussion was invited, his quick decision when all had been heard, combined to show a thoroughness of mental training as rare as his natural ability and his facile adaptation to a new and enlarged field of labor.

"With perfect comprehension of all the inheritances of the war, with a cool calculation of the obstacles in

his way, impelled always by a generous enthusiasm, Garfield conceived that much might be done by his administration toward restoring harmony between the different sections of the Union. He was anxious to go South and speak to the people. As early as April he had ineffectually endeavored to arrange for a trip to Nashville, whither he had been cordially invited, and he was again disappointed a few weeks later to find that he could not go to South Carolina to attend the centennial celebration of the victory of the Cowpens. But for the autumn he definitely counted on being present at three memorable assemblies in the South, the celebration at Yorktown, the opening of the Cotton Exposition at Atlanta, and the meeting of the Army of the Cumberland at Chattanooga. He was already turning over in his mind his address for each occasion, and the three taken together, he said to a friend, gave him the exact scope and verge which he needed. At Yorktown he would have before him the associations of a hundred years that bound the South and the North in the sacred memory of a common danger and a common victory. At Atlanta he would present the material interests and the industrial development which appealed to the thrift and independence of every household, and which should unite the two sections by the instinct of self-interest and self-defense. At Chattanooga he would revive memories of the war only to show that after all its disaster and all its suffering, the country was stronger and greater, the Union rendered indissoluble, and the future, through the agony and blood of one generation, made brighter and better for all.

"Garfield's ambition for the success of his administration was high. With strong caution and conservatism in his nature, he was in no danger of attempting rash experiments or of resorting to the empiricism of statesmanship. But he believed that renewed and closer attention should be given to questions affecting the material interests and commercial prospects of fifty millions of people. He believed that our continental relations, extensive and undeveloped as they are, involved responsibility, and could be cultivated into profitable friendship or be abandoned to harmful indifference or lasting enmity. He believed with equal confidence that an essential forerunner to a new era of national progress must be a feeling of contentment in every section of the Union, and a generous belief that the benefits and burdens of government would be common to all. Himself a conspicuous illustration of what ability and ambition may do under republican institutions, he loved his country with a passion of patriotic devotion, and every waking thought was given to her advancement. He was an American in all his aspirations, and he looked to the destiny and influence of the United States with the philosophic composure of Jefferson and the demonstrative confidence of John Adams.

"The political events which disturbed the President's serenity for many weeks before that fatal day in July form an important chapter in his career, and, in his own judgment, involved questions of principle and of right which are vitally essential to the constitutional administration of the Federal Government. It would be out of place here and now to speak the language of controversy; but the events referred to, however they may continue to be a source of contention with others, have become, so far as Garfield is concerned, as much a matter of history as his heroism at Chickamauga or his illustrious service in the House. Detail is not needful, and personal antagonism shall not be rekindled by any word uttered to-day. The motives of those opposing him are not to be here adversely interpreted nor their course harshly characterized. But of the dead President this is to be said, and said because his own speech is for ever silenced and he can be no more heard except through the fidelity and the love of surviving friends: from the beginning to the end of the controversy he so much deplored, the President was never for one moment actuated by any motive of gain to himself or of loss to others. Least of all men did he harbor revenge, rarely did he even

show resentment, and malice was not in his nature. He was congenially employed only in the exchange of good offices and the doing of kindly deeds.

"There was not an hour, from the beginning of the trouble till the fatal shot entered his body, when the President would not gladly, for the sake of restoring harmony, have retraced any step he had taken if such retracing had merely involved consequences personal to himself. The pride of consistency, or any supposed sense of humiliation that might result from surrendering his position, had not a feather's weight with him. No man was ever less subject to such influences from within or from without. But after most anxious deliberation and the coolest survey of all the circumstances, he solemnly believed that the true prerogatives of the Executive were involved in the issue which had been raised, and that he would be unfaithful to his supreme obligation if he failed to maintain, in all their vigor, the constitutional rights and dignities of his great office. He believed this in all the convictions of conscience when in sound and vigorous health, and he believed it in his suffering and prostration in the last conscious thought which his wearied mind bestowed on the transitory struggles of life.

"More than this need not be said. Less than this could not be said. Justice to the dead, the highest obligation that devolves upon the living, demands the declaration that in all the bearings of the subject, actual or possible, the President was content in his mind, justified in his conscience, immovable in his conclusions."

#### RELIGIOUS VIEWS.

"The religious element in Garfield's character was deep and earnest. In his early youth he espoused the faith of the Disciples, a sect of that great Baptist communion which in different ecclesiastical establishments is so numerous and so influential throughout all parts of the United States. But the broadening tendency of his mind and his active spirit of inquiry were early apparent and carried him beyond the dogmas of sect and the restraints of association. In selecting a college in which to continue his education he rejected Bethany, though presided over by Alexander Campbell, the greatest preacher of his church. His reasons were characteristic: first, that Bethany leaned too heavily toward slavery; and, second, that being himself a Disciple and the son of Disciple parents, he had little acquaintance with people of other beliefs, and he thought it would make him more liberal, quoting his own words, both in his religious and general views, to go into a new circle and be under new influences.

"The liberal tendency which he anticipated as the result of wider culture was fully realized. He was emancipated from mere sectarian belief, and with eager interest pushed his investigations in the direction of modern progressive thought. He followed with quickening step in the paths of exploration and speculation so fearlessly trodden by Darwin, by Huxley, by Tyndall, and by other living scientists of the radical and advanced type. His own church, binding its disciples by no formulated creed, but accepting the Old and New Testaments as the word of God with unbiased liberality of private interpretation, favored, if it did not stimulate, the spirit of investigation. Its members profess with sincerity, and profess only, to be of one mind and one faith with those who immediately followed the Master, and who were first called Christians at Antioch.

"But however high Garfield reasoned of 'fixed fate, free-will, foreknowledge absolute,' he was never separated from the Church of the Disciples in his affections and in his associations. For him it held the ark of the covenant. To him it was the gate of heaven. The world of religious belief is full of solecisms and contradictions. A philosophic observer declares that men by the thousand will die in defense of a creed whose doctrines they do not comprehend and whose tenets they habitually violate. It is equally true that men by the thousand will cling to church organiza-

tions with instinctive and undying fidelity when their belief in maturer years is radically different from that which inspired them as neophytes.

"But after this range of speculation, and this latitude of doubt, Garfield came back always with freshness and delight to the simpler instincts of religious faith, which, earliest implanted, longest survive. Not many weeks before his assassination, walking on the banks of the Potomac with a friend, and conversing on those topics of personal religion, concerning which noble natures have an unconquerable reserve, he said that he found the Lord's Prayer and the simple petitions learned in infancy infinitely restful to him, not merely in their stated repetition, but in their casual and frequent recall as he went about the daily duties of life. Certain texts of Scripture had a very strong hold on his memory and his heart. He heard, while in Edinburgh some years ago, an eminent Scotch preacher who prefaced his sermon with reading the eighth chapter of the Epistle to the Romans, which book had been the subject of careful study with Garfield during all his religious life. He was greatly impressed by the elocution of the preacher, and declared that it had imparted a new and deeper meaning to the majestic utterances of St. Paul. He referred often in after-years to that memorable service, and dwelt with exaltation of feeling upon the radiant promise and the assured hope with which the great apostle of the Gentiles was 'persuaded that neither death, nor life, nor angels, nor principalities, nor powers, nor things present, nor things to come, nor height, nor depth, nor any other creature, shall be able to separate us from the love of God, which is in Christ Jesus our Lord.'

"The crowning characteristic of General Garfield's religious opinions, as, indeed, of all his opinions, was his liberality. In all things he had charity. Tolerance was of his nature. He respected in others the qualities which he possessed himself—sincerity of conviction and frankness of expression. With him the inquiry was not so much what a man believes, but does he believe it? The lines of his friendship and his confidences encircled men of every creed and men of no creed, and to the end of his life, on his ever-lengthening list of friends, were to be found the names of a pious Catholic priest and of an honest-minded and generous-hearted free-thinker."

#### THE END.

"On the morning of Saturday, July 2d, the President was a contented and happy man—not in an ordinary degree, but joyfully, almost boyishly happy. On his way to the railroad station to which he drove slowly, in conscious enjoyment of the beautiful morning, with an unwonted sense of leisure and a keen anticipation of pleasure, his talk was all in the grateful and gratulatory vein. He felt that after four months of trial his administration was strong in its grasp of affairs, strong in popular favor, and destined to grow stronger; that grave difficulties confronting him at his inauguration had been safely passed; that trouble lay behind him and not before him; that he was soon to meet the wife whom he loved, now recovering from an illness which had but lately disquieted and at times almost unnerved him; that he was going to his Alma Mater to renew the most cherished associations of his young manhood, and to exchange greetings with those whose deepening interest had followed every step of his upward progress from the day he entered upon his college course until he had attained the loftiest elevation in the gift of his countrymen.

"Surely, if happiness can ever come from the honors or triumphs of this world, on that quiet July morning James A. Garfield may well have been a happy man. No foreboding of evil haunted him; no slightest premonition of danger clouded his sky. His terrible fate was upon him in an instant. One moment he stood erect, strong, confident in the years stretching peacefully out before him. The next he lay wounded, bleeding, helpless, doomed to weary weeks of torture, to silence, and the grave.

"Great in life, he was surpassingly great in death.

For no cause, in the very frenzy of wantonness and wickedness, by the red hand of murder, he was thrust from the full tide of this world's interest, from its hopes, its aspirations, its victories, into the visible presence of death—and he did not quail. Not alone for the one short moment in which, stunned and dazed, he could give up life, hardly aware of its relinquishment, but through days of deadly languor, through weeks of agony, that was not less agony because silently borne, with clear sight and calm courage, he looked into his open grave. What blight and ruin met his anguished eyes, whose lips may tell—what brilliant, broken plans, what baffled, high ambitions, what sundering of strong, warm, manhood's friendships, what bitter rending of sweet household ties! Behind him a proud, expectant nation, a great host of sustaining friends, a cherished and happy mother, wearing the full, rich honors of her early toil and tears; the wife of his youth, whose whole life lay in his; the little boys not yet emerged from childhood's day of frolic; the fair young daughter; the sturdy sons just springing into closest companionship, claiming every day and every day rewarding a father's love and care; and in his heart the eager, rejoicing power to meet all demand. Before him, desolation and great darkness! And his soul was not shaken. His countrymen were thrilled with instant, profound, and universal sympathy. Masterful in his mortal weakness, he became the center of a nation's love, enshrined in the prayers of a world. But all the love and all the sympathy could not share with him his suffering. He trod the wine-press alone. With unflinching front he faced death. With unfailing tenderness he took leave of life. Above the demoniac hiss of the assassin's bullet he heard the voice of God. With simple resignation he bowed to the divine decree.

"As the end drew near, his early craving for the sea returned. The stately mansion of power had been to him the wearisome hospital of pain, and he begged to be taken from its prison-walls, from its oppressive, stifling air, from its homelessness and its hopelessness. Gently, silently, the love of a great people bore the pale sufferer to the longed-for healing of the sea, to live or to die, as God should will, within sight of its heaving billows, within sound of its manifold voices. With wan, fevered face tenderly lifted to the cooling breeze, he looked out wistfully upon the ocean's changing wonders; on its far sails, whitening in the morning light; on its restless waves, rolling shoreward to break and die beneath the noonday sun; on the red clouds of evening, arching low to the horizon; on the serene and shining pathway of the stars. Let us think that his dying eyes read a mystic meaning which only the rapt and parting soul may know. Let us believe that in the silence of the receding world he heard the great waves breaking on a farther shore, and felt already upon his wasted brow the breath of the eternal morning."

[The orator on concluding was greeted with most hearty applause, in which the whole audience joined.]

Rev. J. J. Bullock, the Chaplain of the Senate, pronounced the benediction, as follows:

"May the peace of God, which passeth all understanding, keep your minds and hearts in the knowledge and love of God and his Son, Jesus Christ, our Lord. And the blessing of God Almighty, the Father, the Son, and the Holy Ghost, rest upon and remain with you, now and for evermore. Amen."

The President and his Cabinet, the Chief-Justice and associate justices of the Supreme Court, and other invited guests then retired from the hall; after which the Senate returned to their chamber.

The House having been called to order—

Mr. McKinley, of Ohio, submitted the fol-

lowing resolutions, which were unanimously adopted:

*Resolved (the Senate concurring),* That the thanks of Congress be presented to Hon. James G. Blaine, for the appropriate memorial address delivered by him on the life and services of James Abram Garfield, late President of the United States, in the Representatives' hall, before both Houses of Congress and their invited guests, on the 27th day of February, 1882; and that he be requested to furnish a copy for publication.

*Resolved,* That the chairmen of the joint committee appointed to make the necessary arrangements to carry into effect the resolutions of this Congress in relation to the memorial exercises in honor of James Abram Garfield be requested to communicate to Mr. Blaine the foregoing resolution, receive his answer thereto, and present the same to both Houses of Congress.

Mr. McKinley: "I now offer the resolution which I send to the Clerk's desk."

The Clerk read as follows:

*Resolved,* That as a further testimonial of respect to the deceased President of the United States, the House do now adjourn.

The resolution was adopted; and thereupon (at one o'clock and fifty-five minutes P. M.) the House adjourned.

**WOMAN SUFFRAGE.**—In the Senate, on December 14th, Mr. Hoar, of Massachusetts, moved to take up the following resolution reported by the Committee on Rules:

*Resolved,* That a select committee of seven Senators be appointed by the Chair, to whom shall be referred all petitions, bills, and resolves providing for the extension of suffrage to women or the removal of their legal disabilities.

The President *pro tempore*: "The resolution is before the Senate for consideration."

Mr. Vest, of Missouri: "Mr. President, I am constrained to object to the passage of this resolution, and I do it with considerable reluctance. At present we have thirty standing committees of the Senate, and we have four joint committees and seven special committees, in addition to the committee now proposed.

"But, Mr. President, I will be entirely ingenuous and give another reason. This is simply a step toward the recognition of woman suffrage, and I am opposed to it upon principle in its inception. In my judgment it has nothing but mischief in it to the institutions and to the society of this whole country. I do not propose to enter into a discussion of that subject to-day, but it will be proper for me to make this statement, and I make it intending no reflection upon the zealous ladies who have engaged for the past ten years in manufacturing a public sentiment upon this question. I received to-day a letter from a distinguished lady in my own State, for whom I have personally the greatest admiration and respect, calling my attention to the fact that I propose to deny justice to the women of the country. Mr. President, I deny it. It is because I believe that the conservative influence of society in the United States rests with the women of

the country that I propose not to degrade the wife and mother to the ward politician, the justice of the peace, or the notary public. It is because I believe honestly that all the best influences for the conservatism of society rest upon the women of the country in their proper sphere, that I shall oppose this and every other step now and henceforth as violating, as I believe, one of the great essential fundamental laws of nature and of society.

"Mr. President, the revenges of nature are sure and unerring, and these revenges are just as certain in political matters and in social matters as in the physical world. Now and here I desire to record once for all my conviction that in this movement to take the women of the country out of their proper sphere of social influence, that great and glorious sphere in which nature and nature's God have placed them, and rush them into the political arena, the attempt is made to put them where they were never intended to be; and I now and here record my opposition to it. This may seem to be but a small matter, but as this letter shows, and I reveal no private confidence, it recognizes the first great step in this reform, as its advocates are pleased to term it."

Mr. Hoar: "Mr. President, I do not understand that the question which the honorable Senator from Missouri has discussed with so much eloquence is before the Senate. No question of the extension of suffrage to any portion of our citizens is raised by the resolution which is before the Senate. The only question now is, first, whether Senators like the honorable Senator from Missouri will prefer to decide this question before it is heard or after; and next, whether if one half the population of this country have an interest which their representatives desire to present to Congress, it will be more convenient to give them a hearing by one of the standing committees of the Senate or by a separate committee appointed for that purpose. I suppose the Judiciary Committee would be entirely competent, and would be for many reasons entirely appropriate, as the proper organ of the Senate to hear the requests of these ladies; but the Judiciary Committee is crowded with great subjects, and as one very intelligent Senator observed to me, yesterday, 'Send the matter to the Judiciary Committee, for they never report on anything.' This committee is proposed, not alone to hear any representation or arguments which may be proper to be heard in regard to the question of woman suffrage, but in regard to all subjects where these ladies think their sex lies under an improper legal disability.

"Mr. President, I suppose that the wildest conservative in this country will not deny that the old common law in defining the rights and duties of English and American women was not only unjust but almost brutal. No matter what might be the degradation of the husband, the person, the earnings, the personal prop-

erty, the real estate for life of the wife were absolutely in his power.

"The discussion of this class of questions has convinced the American people, I believe, to an absolute unanimity of judgment, that the law which permitted the husband to beat his wife with a rod, which varied in size with the thumb of the lord chief-justice or chancellor, which denied her the right to secure the earnings of her own day's work, which denied her any voice or control in the education, or custody, or direction of the children which she had borne, was not only unjust but almost brutal.

"Within our national jurisdiction, with Congress organizing the institutions of the great Territories which are to become imperial States, is it not fitting that that class of considerations should be gravely, fully, adequately considered? If so, I do not see why the honorable Senator from Missouri (who I know entertains as high and chivalrous a regard for the sex to which our mothers and sisters and wives belong as any man on this floor) should not unite with me in providing for giving a respectful and thorough hearing, which it is impossible that any of the standing committees of this body can do, to the petitioners on this class of subjects. Unless I am misinformed, it is the rule of the Judiciary Committee, from which they almost never depart, to give no hearings at all, a course to which they are constrained by the necessities of the business committed to them. Therefore, entirely independent of any question of the right or propriety of extending suffrage to the women of this country, it seems to me eminently proper and fitting that this committee should be raised."

Mr. Vest: "If the Senator will permit me, I simply wish to state in reference to his argument as to the Territories that I have the honor to be a member of the Committee on Territories, and at the last session, I believe, or the session before, while the Senator from Arkansas (Mr. Garland) was the chairman of that committee, we heard most respectfully and patiently for two days, I think, the advocates of woman suffrage in the Territories of the United States, and that committee to-day is ready to hear those ladies upon that question at any time they choose to appear before it."

Mr. Hoar: "The Senator's suggestion does not cover the District of Columbia; it does not cover the jurisprudence of the national courts, the practice or the rights, wherever they extend. The Committee on Territories is not raised for the purpose of dealing with that class of questions, as this committee would be. Therefore, I say it seems to me entirely independent of the opinion of any Senator upon the question of the extension of suffrage to women, that the raising of this committee is a right and proper and expedient measure."

Mr. Vest: "The Senator from Massachusetts was pleased to say that the Committee on the Judiciary had so many important questions pending before it that the subject of woman suffrage should not be added to them. The Committee on Territories is open to any complaint or suggestion by the ladies who advocate woman suffrage, in regard to this subject in the Territories; and the Committee on Privileges and Elections, to which this subject should go most appropriately, as affecting the suffrage, has not now before it, as I am informed, one single bill, resolution, or proposition of any sort whatever. That committee is also open to inquiry upon this subject.

"But, Mr. President, out of all committees without business, and habitually without business, in this body, there is one that beyond any question could take jurisdiction of this matter and do it ample justice. I refer to that most respectable and antique institution, the Committee on Revolutionary Claims. For thirty years it has been without business. For thirty long years the placid surface of that parliamentary sea has been without one single ripple. If the Senator from Massachusetts desires a tribunal for calm judicial equilibrium and examination, a tribunal far from the 'madding crowd's ignoble strife,' a tribunal eminently respectable, dignified, and unique, why not send this question to the Committee on Revolutionary Claims? When I name the *personnel* of that committee it will be evident that any consideration on any subject touching the female sex would receive not only deliberate but immediate attention, for the second member upon that committee is my distinguished friend from Florida (Mr. Jones), and who can doubt that he would give his undivided attention to the subject? It is eminently proper that this subject should go to that committee because if there is any revolutionary claim in this country it is that of woman suffrage. It revolutionizes society; it revolutionizes religion; it revolutionizes the Constitution and laws; and it revolutionizes the opinions of those so old-fashioned among us as to believe that the legitimate and proper sphere of woman is the family circle as wife and mother and not as politician and voter—those of us who are proud to believe that—

'A woman's noblest station is retreat;  
Her fairest virtues fly from public sight;  
Domestic worth—that shuns too strong a light.'

"Before that Committee on Revolutionary Claims why could not this most revolutionary of all claims receive immediate and ample attention? More than that, as I said before, if there is any tribunal that could give undivided time and dignified attention, is it not this committee? If there is one peaceful haven of rest, never disturbed by any profane bill or resolution of any sort, it is the Committee on Revolutionary Claims. It is, in parliamentary life, described by that ecstatic verse in Watts's hymn:

'There shall I bathe my wearied soul  
In seas of endless rest,  
And not one wave of trouble roll  
Across my peaceful breast.'

"For thirty years there has been no excitement in that committee, and it needs to-day, in Western phrase, some 'stirring-up.' Sir, I insist upon it that in deference to this committee; in deference to the fact that it needs this sort of regimen and medicine, this whole subject should be so referred."

The President *pro tempore*: "The Senator from Missouri offers an amendment, that the subject be referred to the standing Committee on Revolutionary Claims. The question is on the amendment of the Senator from Missouri."

Mr. Farley called for the yeas and nays; and they were ordered and taken, as follows:

YEAS—Bayard, Beck, Brown, Butler, Camden, Coke, Fair, Farley, Garland, Gorman, Hampton, Harris, Jackson, Jonas, Maxey, Morgan, Saulsbury, Vance, Vest, Voorhees, Walker, Williams—22.

NAYS—Aldrich, Cameron of Pennsylvania, Cameron of Wisconsin, Conger, Davis of Illinois, Dawes, Edmunds, Frye, Hale, Harrison, Hawley, Hill of Colorado, Hoar, Johnston, Jones of Florida, Kellogg, Logan, McMill, McMillan, Miller of California, Mitchell, Morrill, Platt, Plumb, Ransom, Rollins, Saunders, Sawyer, Sherman, Teller, Windom—31.

ABSENT—Allison, Anthony, Blair, Call, Cockrell, Davis of West Virginia, Ferry, George, Groome, Grover, Hill of Georgia, Ingalls, Jones of Nevada, Lamar, Lapham, McPherson, Mahone, Miller of New York, Pendleton, Pugh, Sewell, Slater, Van Wyck—23.

So the motion was not agreed to.

The President *pro tempore*: "The question recurs on the adoption of the resolution. It is in order to move to refer the resolution to the Committee on the Judiciary, the Chair understands."

Mr. Bayard, of Delaware: "I make a motion that the resolution be sent to the Committee on the Judiciary.

"I would state that I voted with some regret and hesitancy upon the motion of the Senator from Missouri (Mr. Vest) to refer this matter to the Committee on Revolutionary Claims. My regret was owing to the fact that I do not wish even to seem to treat a subject of this character in a spirit of levity or to indicate the slightest disrespect, by such a reference, to those whose opinions upon this subject differ essentially from my own. I cast the vote because I considered it would be taking the subject virtually away from the consideration of Congress at its present session. I do, however, hold that there is no necessity for the creation of a special committee to attend to this subject. The Committee on the Judiciary has within the last few years, upon many occasions, attempted to deal with it. Since you, sir, and I have been members of that committee—"

Mr. Hoar: "I desire to ask the Senator, if he is willing, having been lately a member of the committee to which he refers, whether it is not the rule of that committee to allow no hearings to individual petitioners, a rule which

is departed from only in very rare and peculiar cases?"

Mr. Bayard: "I will reply to the honorable Senator that the occasion which arose to my mind and caused me to remember the action of that committee was the audience given by it to a very large delegation of woman suffragists, to wit, the representatives of a convention held in this city, who to the number, I think, of twenty-five, came into the committee-room of the Committee on the Judiciary, and were heard, as I remember, for more than one day, or certainly had more than one hearing, before that committee, of which you, sir, and I were members."

Mr. Hoar: "If the Senator will pardon me, however, he has not answered my question. I asked the Senator not whether on one particular occasion they gave a hearing on this subject, but whether it is not the rule of that committee, occasioned by the necessity of its business from which it departs only in very rare cases, not to give hearings?"

Mr. Bayard: "I can not answer whether a rule so defined as that suggested by the honorable Senator from Massachusetts exists in that committee. It is my impression, however, that cases are frequently, by order of that committee, argued before it. We have had very elaborate and able arguments upon subjects connected with the Pacific Railroads, I remember; and we have had arguments upon various subjects. It is constantly our pleasure to hear members of the Senate upon a variety of questions before that committee. It may be only a proof that women's rights are not unrecognized nor their influence unfelt when I state the fact that if there be such a rule as is suggested by the honorable Senator from Massachusetts of excluding persons from the audience of that committee, on the occasion of the application of the ladies a hearing was granted, and they came in force—not only force in numbers, but force in the character and intelligence of those who appeared before the committee. They were listened to with great respect, but their views were not concurred in by the committee as it was then composed.

"We were all entertained by the bright wit, the clever and, in my judgment, in many respects, the just sarcasm of our honorable friend from Missouri (Mr. Vest), but my habit is not to consider public measures in a jocular light; it is not to consider a question of this kind in a jocular light. Whatever may be the merits or demerits of this proposition, whatever may be the reasons for or against it, no man can doubt that it will strike at the very roots of the present organization of society, and that its consequences will be most profound and far-reaching should the advocates of the measure proposed prevail.

"Therefore it is that I think this subject should not be considered separately; it should not have a special committee—either of advocates or opponents arranged for its considera-

tion; but it should go where proposed amendments to the fundamental law of the land have always been sent for consideration—to that committee to which judicial questions, questions of a constitutional nature, have always in the history of this Government been committed. There is no need, there is no justice, there is no wisdom in attempting to separate the fate of this question, which affects society so profoundly and generally, from the other questions that affect society. It can not be made a specialty; it ought not to be. You can not tear this question from the great contests of human passions, affections, and interests which surround it, and treat it as a thing by itself. It has many sides from which it may be viewed, some that are not proper or fitting for this forum, and a discussion now in public. There are the claims of religion itself to be considered in connection with this case. Civil rights, social rights, political rights, religious rights, all are bound up in the consideration of a measure like this. In its consideration you can not safely attempt to segregate this question and leave it untouched and uninfluenced by all those other questions by which it is surrounded, and in the consideration of which it is bound to be connected and concerned."

Mr. Beck, of Kentucky: "I desire to say only in a word that the difficulty I have and the question I desire the Committee on the Judiciary to report upon is the effect of this question upon suffrage. By the fifteenth amendment to the Constitution of the United States there can be no discrimination made in regard to voting on account of race, color, or previous condition. Intelligence is properly regarded as one of the fundamental principles of fair suffrage. We have been compelled in the last ten years to allow all the colored men of the South to become voters. There is a mass of ignorance there to be absorbed that will take years and years of care in order to bring that class up to the standard of intelligent voters. The several States are addressing themselves to that task as earnestly as possible. Now it is proposed that all the women of the country shall vote; that all the colored women of the South, who are as much more ignorant than the colored men as it is possible to imagine, shall vote. Not one perhaps in a hundred of them can read or write. The colored men have had the advantages of communication with other men in a variety of forms. Many of them have considerable intelligence; but the colored women have not had equal chances. Take them from their wash-tubs and their household work, and they are absolutely ignorant of the new duties of voting citizens. The intelligent ladies of the North and the West and the South can not vote without extending that privilege to that class of ignorant colored people.

"I doubt whether any man will say that it is safe for the republic now, when we are go-

ing through the problem we are obliged to solve, to fling in this additional mass of ignorance upon the suffrage of the country. Why, sir, a rich corporation or a body of men of wealth could buy them up for fifty cents apiece, and they would vote without knowing what they were doing for the side that paid most. Yet we are asked to confer suffrage upon them, and to have a committee appointed as favorable to that view as is possible, so as to get a favorable report upon it!

"I want the Committee on the Judiciary to tell the Congress and the country whether they think it is good policy now to confer suffrage on all the colored women of the South, ignorant as they are known to be, and thus add to the ignorance that we are now struggling with, and whether the republic can be sustained upon such a basis as that."

Mr. Morgan, of Alabama: "Inasmuch as this measure, I understand, has been made a party measure by the decree of a caucus, I propose to make some little inquiry into the past legislation of the Congress of the United States under Republican rule in respect of the extension of the right of suffrage to certain classes of people in this country. I will take up first the Territories. A system has prevailed in the organization of the Territories, I believe, uniformly the same as that which obtained in the case of the organization of the Territory of Utah. Under the fifth section of the act organizing the Territory of Utah, which was passed in 1850, it is provided:

That every free white male inhabitant above the age of twenty-one years, who shall have been a resident of said Territory at the time of the passage of this act, shall be entitled to vote at the first election, and shall be eligible to any office within the said Territory; but the qualifications of voters and of holding office, at all subsequent elections, shall be such as shall be prescribed by the Legislative Assembly: *Provided*, That the right of suffrage and of holding office shall be exercised only by citizens of the United States, including those recognized as citizens by the treaty with the Republic of Mexico, concluded February 2, 1848.

"I believe that every Territorial government is modeled upon this system, so far as it concerns the right of suffrage. We have put it in the power of the Territorial Legislature, after the first vote has been cast under the laws of the United States organizing the Territory, to prescribe the qualifications of voters, and after the qualification has been regulated by the law of the Territory, the remaining power in Congress is only to repeal or modify such legislation. So, sir, we have put it in the power of these Territorial Legislatures to provide for female suffrage, and if they should undertake to establish the right of women to vote, in order to correct that if we think it needs correction, we should have to repeal the act or modify it. A Territorial Legislature has the absolute right of legislation under such circumstances, and we only have the right to repeal or modify what they may do.

"Let us look for a moment at the result of woman suffrage in some of the Territories. I have read to you the act of 1850, organizing the Territory of Utah. The Territorial Legislature has gone forward and conferred the right of suffrage upon the women of Utah Territory. The population of Utah Territory in the last decade has reached from 64,000, I believe, to about 150,000; I can not state the figures exactly. The Territorial Legislature of Utah conferred upon the females of that Territory the right of suffrage, and how have they exerted that right? Sir, I am ashamed to say it, but it is known to the world that the power of Mormonism and polygamy in Utah Territory is sustained by female suffrage. You can not get rid of those laws. Ninety per cent of the legislative power of Utah Territory is Mormon and polygamous. If female suffrage is to be incorporated into the laws of our country with a view to the amelioration of our morals or our political sentiments, we stand aghast at the spectacle of what has been wrought by its exercise in the Territory of Utah. There stands a power supporting the crime of polygamy through what they call a divine inspiration, or teaching from God, and all the power of the judges of the United States, and of the Congress of the United States, has been unavailing to break it down. Who have upheld it? Those who in the family circle represent one husband to fifteen women.

"We have now 10,000,000 voters in the United States, who represent 50,000,000 people. What is the attitude of an American voter in reference to the non-voting population? It is that of a representative. One man in our political policy represents five people in voting, whether in a local election or in the most important election to which his franchise extends. He stands in our system as a representative of five people and votes for them; and by necessity it must remain so, because every child and every woman can not vote, and there must be some line of demarcation which fixes the boundary of the franchise of voting. That boundary was wisely fixed with reference to the supposed condition of families and the necessities of families, so that when a child became twenty-one years of age, if he were a son, or, being the head of a family and twenty-one years of age and over, he could represent that family in casting a ballot; and it adds much to the dignity and the value of the position of the American citizen that in all the different departments in which he is allowed to exercise the power of the ballot he is attended with the responsibility of this representative character. We must not discard that.

"Where is the necessity of raising the number of voters in the United States from 10,000,000 to 20,000,000? That would be the direct effect of conferring suffrage upon the women, for they have at least one half, if not a little more than one half, of the entire population of

the country above the age of twenty-one. We have now masses of voters so enormous in numbers as that it seems to be almost beyond the power of the law to execute the purposes of the elective franchise with justice, with propriety, and without crime. How much would these difficulties and these intrinsic troubles be increased if we should raise the number of voters from ten to twenty million in the United States! That would be the direct and immediate effect of conferring the franchise upon the women. What would be the next effect of such an extension of the suffrage?

"Gentlemen come here into the Senate of the United States and make long speeches urging upon the States the necessity of securing a full, free, fair, and unbridged right on the part of negroes to vote everywhere, and scolding and vituperating the States in respect of their conduct, when they themselves, after having given to the negroes the right of suffrage in the District of Columbia, took it away because they could not stand it in their own persons and in reference to their own property. If there had not been a Republican in the United States who owned any property in the District of Columbia, the negroes to-day would have been voters in this District; but when it was found that negro suffrage was to control Republican property and Republican administration of local affairs in the District of Columbia, then with one broad swoop they dismissed the negro and the white man and the woman from all opportunities of exercising the power to vote. Let it not any more be thrown at us that we have denied any people the right of suffrage, that we have abridged or in any way restrained any persons in the exercise of this right, when the men who have had such immense majorities in both branches of Congress have absolutely sponged out the right of the white and the black both to vote, merely to get rid of negro suffrage."

The President *pro tempore*: "The question is on the adoption of the resolution."

The roll-call having been concluded, the result was announced, as follows:

YEAS—Aldrich, Allison, Anthony, Blair, Cameron of Pennsylvania, Cameron of Wisconsin, Conger, Davis of Illinois, Dawes, Edmunds, Ferry, Frye, Harrison, Hawley, Hill of Colorado, Hoar, Jones of Florida, Jones of Nevada, Kellogg, Lapham, Logan, McDill, McMillan, Miller of California, Mitchell, Morrill, Platt, Plumb, Ransom, Rollins, Saunders, Sawyer, Sewell, Sherman, Windom—35.

NAYS—Bayard, Beck, Brown, Butler, Camden, Cockrell, Coke, Davis of West Virginia, Fair, Farley, Garland, Hampton, Hill of Georgia, Jackson, Jonas, McPherson, Maxey, Saulsbury, Slater, Vance, Vest, Walker, Williams—23.

ABSENT—Call, George, Gorman, Groome, Grover, Hale, Harris, Ingalls, Johnston, Lamar, Mahone, Miller of New York, Morgan, Pendleton, Pugh, Teller, Van Wyck, Voorhees—18.

So the resolution was agreed to.

THE TARIFF COMMISSION.—In the House, on March 28th, the following bill was considered:

*Be it enacted, etc.*, That a commission is hereby created to be called the "tariff commission," to consist of nine members.

SECTION 2. That the President of the United States shall, by and with the advice and consent of the Senate, appoint nine commissioners from civil life, one of whom, the first named, shall be the president of the commission. The commissioners shall receive as compensation for their services each at the rate of ten dollars per day when engaged in active duty, and actual traveling and other necessary expenses. The commission shall have power to employ a stenographer and a messenger; and the foregoing compensation and expenses to be audited and paid by the Secretary of the Treasury out of any moneys in the Treasury not otherwise appropriated.

SEC. 3. That it shall be the duty of said commission to take into consideration and to thoroughly investigate all the various questions relating to the agricultural, commercial, mercantile, manufacturing, mining, and industrial interests of the United States, so far as the same may be necessary to the establishment of a judicious tariff, or a revision of the existing tariff, and the existing system of internal revenue laws, upon a scale of justice to all interests; and for the purpose of fully examining the matters which may come before it, said commission, in the prosecution of its inquiries, is empowered to visit such different portions and sections of the country as it may deem advisable.

SEC. 4. That the commission shall report to Congress the results of their investigation, and the testimony taken in the course of the same, from time to time, and make their final report not later than the first Monday in January, 1883.

Mr. Kasson, of Iowa: "Mr. Chairman, the bill presented for the consideration of the House is not new either to the House or to the country. It contains but few provisions, and they are easily comprehended, and may be simply stated.

"The theory, as I understand it, of its provisions is that this commission shall take up a given subject, for example the question of iron and its advanced products, proceed with this investigation, and so soon as the examination shall be rounded up and concluded, their report on that subject, and the facts ascertained by them, shall be immediately distributed for the consideration of Senators and members of the House. Then, another subject, wool and woolens, silks, agricultural products, and so on, so far as it shall be found necessary to consult the material interests of this country, and to consider their relations to each other. By another provision of the bill their report shall be submitted to Congress, the entire report, at the first meeting of Congress in December next, that action may be taken on it at that session. These are, simply stated, the provisions of the bill. The first question, I apprehend, that the members of this House would desire to be satisfied upon, is whether a revision of the present tariff is necessary; whether the present system, in its character, scope, and details, is or ought to be satisfactory to the country.

"This proposition, Mr. Chairman, needs but very little debate. I know of very few people in the United States who admit they have no complaint to make against some part of the details of the present tariff. Whether you are free-traders or prohibitory tariff men, protect-

ive tariff men, or advocates of a tariff for revenue only, I take it for granted that you all agree that in some manner the present tariff should be reviewed and more or less modified.

"For the last twenty years, subject to some slight partial modifications, this country has been conducting its business under the present tariff laws. As to its character and effect I shall speak later. At present I have only this to say, that the interests of the country have themselves become greatly modified, and in some respects radically changed, in the course of these twenty years. New industries have sprung up, and modifications of old industries have come into existence. New inventions have been applied in many arts, and thousands of new influences bearing upon the question of relative protection, upon the rates of duty required, upon the cost of production, and combination of materials, have arisen not only in America but in Europe. The conditions of competition between this country and Europe have consequently materially changed. This could not be helped. Changes are always occurring in progressive countries, not only in mechanical appliances but in the products of industry put upon the markets of the world.

"These changes are elements that always enter into a question of revision of any tariff system every few years in the progress of any nation; and every nation is obliged from time to time to revise its system of revenue, owing to the changed conditions which have come into existence, and have modified the character of the results obtained under the previous conditions. A striking proof of the necessity in our own legislation is found in the fact stated in the other House, that in four years eighteen hundred cases for the decision of the Secretary of the Treasury have been submitted to him arising under our present system. Many cases have been decided by the courts. All this shows the need of revision of law based on investigation of the actual present condition of our industries and securing greater precision.

"Gentlemen have often said to us: 'Oh, you do not mean anything by this tariff commission except delay; you do not want to touch the tariff or modify it at all; you have held this policy before us for one, two, or three years for no other purpose than to shield the manufacturers against a revision of the tariff.' Mr. Chairman, I take this occasion to say that this allegation does not come with the proper grace from our friends on the other side, who had it in their power in the last Congress to have allowed that bill to be taken from the Speaker's table and acted upon, as was desired by every member on this side of the House. Had that been done, then by January of this year a report would have been before you, a bill prepared, and your revision of the tariff would have been now in full progress.

"We have seen in the resistance offered today the same course pursued by our free-trade and revenue-tariff members against taking up

the question at all. I ask them to look the facts in the face, that this side of the House has been pressing the matter for consideration; that instead of using this proposition as a screen to prevent any action we have tried to hasten it; while for three Congresses our Democratic majority have utterly failed to give anything in the way of a revision in the ordinary form. It must therefore be evident that if we can do anything at all in this Congress it must be through this bill, and by the aid of a commission including neither Senators nor Representatives, but only men who can give their whole time to the subject, and who can visit the seats of our great industries."

Mr. Hewitt, of New York: "Mr. Chairman, I am opposed to the bill creating a tariff commission, for the reason that it will make delay, and delay is dangerous in the present perilous condition of general business. We are now prosperous, but our prosperity will continue only so long as there is an adequate market for our products. At present we have a foreign market chiefly for raw materials—such as food products, cotton, petroleum, and tobacco. For our manufactured products the markets of the world are practically closed against us—closed because it is impossible to sell our goods in the open markets of the world in competition with other manufacturing nations. The reason of this is, mainly, that our tariff legislation has erected artificial barriers to the free introduction of raw materials, and by the imposition of unwise taxes we are handicapped at the very outset in the commercial race. These obstructions can not be removed too soon. They are well known, and can be enumerated without difficulty. We tax food, of which we are the great exporters; we tax wool, which is the foundation of a vast industry; we tax bituminous coal, iron-ore, and scrap-iron, which lie at the base of the great iron and steel industry; we tax copper-ores, alcohol, and oils, and numerous chemicals, without which many branches of industry can not exist.

"Having thus created an artificial system, we find it impossible to compete with Great Britain and France and Germany, whose industry stands upon the firm and natural basis of free raw materials. This defect in our revenue system could be remedied by a joint resolution in one week, and the Committee on Ways and Means could then take as much time as might be needed to consider and adjust the infinite detail involved in the reconstruction of a tariff covering 2,500 articles. Unless a remedy be speedily applied, the industry of this country will be surfeited by the excess of products for which it can find no market. There is a limit to the amount of food which we can sell abroad, and it is a great mistake to suppose that Europe can not raise food in competition with America. The question is not, as many seem to suppose, so much the relative cost of production, as the amount of rent which can be collected from the farmer in Eu-

rope, in addition to the cost of production. It is therefore purely a question of rent. Foreign farms will not be abandoned, but the rents will be reduced and the products will be increased, so that, instead of larger, we are likely to have more restricted markets. The process of readjustment is now going on. Rents have been reduced from 20 to 30 per cent, and if that is not sufficient they will be further reduced until land is as free in Europe as it is upon this continent. Nations will not abandon the soil, but they will resist the imposition of rent and taxes which it will not bear.

"To any one studying the condition of this country at the present time three things are evident: first, that we are the most prosperous people in the world; and there I agree with the gentleman from Iowa; secondly, that we are paying the highest wages of any people in the world; and there again I agree with the gentleman from Iowa; lastly, that we have the highest tariff duties of any nation in the world; and there I think I agree with the gentleman from Iowa. But he reasons *post hoc propter hoc*: because we have a high tariff, therefore we are prosperous, and therefore we pay the highest wages of any nation in the world.

"But let me take him back to that era of depression between 1873 and 1879; and let us diagnose the condition of things then. We had then an era of depression in which men went to and fro in this land begging for employment. Then we had the lowest rate of wages that has prevailed in this country for the last forty years; and then we had the same high tariff that we have to-day. If I were to reason, as the gentleman did, *post hoc propter hoc*, I should say that the high tariff caused the bad times and the low wages and the want of work. But the truth is that the tariff has nothing to do with the matter. I will not say 'nothing to do'; it has an influence for evil, but it has no influence for good; it can not create good times; it can not create high wages; it can not give employment except in one single contingency, to which I shall recur hereafter; and in that contingency it was powerless from 1875 to 1878 inclusive.

"The only logical conclusion from these facts which can not be disputed is, that the depression then and the prosperity now, the low wages then and the high wages now, were not produced by the revenue system, in which no changes whatever have been made, but by causes which must be searched for elsewhere, and which must be understood before it will be possible for Congress to deal intelligently with the work of revenue reform, which public opinion requires it to undertake.

"Now, then, I take my first proposition, directly antagonizing the gentleman from Iowa. I assert that *legislation can not create value nor can it determine the rate of wages*. The issue is fairly made up. There is no source of

wealth in any country except that which is derived from the soil by the application of labor, machinery, and capital.

"It is not possible by any human contrivance, by any amount of abstract thought, by any schemes of legislation to add to the natural resources of any country. Whatever there may be, is in the soil and in the rain and sunshine that fructify it. Capital can only support the labor which is necessary to bring about the annual harvest, and machinery can only be used to economize the amount of labor bestowed. With labor and skill sufficient for the cultivation of the soil, the economy of production will be proportioned to the amount of capital and machinery employed in its cultivation. There is no royal road to wealth—there is no patent process by which the resources of nature can be augmented. 'Can a man by taking thought add a cubit to his stature?' In the absence of any legislation the work of production will proceed in a natural channel, and all that legislation can by any possibility do will be to divert labor and capital from the direction which they would have taken under natural laws. I feel it necessary to make this statement, because many persons who have not given much reflection to this subject seem to think that there is some potency in legislation which can add value to the forces of nature. This fallacy underlies a great many of the propositions which are made in regard to money as well as industry. It is the key to the fiat-money delusion, and it is the explanation of the mistake which is made by those who advocate protection for the sake of protection. When it is once realized that value can not be created by legislative action, and is the offspring only of hard and honest labor aided by actual capital—that is, by the possession of accumulated wealth either in the form of money, structures, materials, or machinery—most of the difficulties in the way of intelligent legislation and of placing our industry upon a secure basis will disappear.

"But if legislation can not create value, it can prevent the growth of wealth by misdirecting industry into unprofitable channels, and by depriving us of the profit which is realized when we exchange the products of our labor, properly applied, for commodities which can be produced in other countries with less expenditure of labor than is necessary to produce these commodities at home. In other words, the profits of legitimate commerce may be altogether or partially destroyed by artificial obstructions to the free natural interchange of commodities. These obstructions constitute a deduction from the amount which our producers would otherwise receive for their labor and skill, and are therefore to be avoided, and not created by the action of government.

"From this simple statement it will be apparent that I do not believe in the efficacy of taxation in any form as an aid to the development of industry. If we could dispense with

taxation altogether it must be evident that the producers of this country would have more to spend and the consumers would get more for the money which they have to expend. As I have already stated, the only possible effect of taxes imposed upon foreign commodities must be to alter the direction or distribution of human effort."

The Speaker: "The question is on the passage of the bill."

The question was taken, and it was decided in the affirmative, as follows:

YEAS—Aldrich, Anderson, Atherton, Barbour, Barr, Bayne, Bingham, Bliss, Bowman, Brewer, Briggs, Browne, Brumm, Buck, Julius C. Burrows, Joseph H. Burrows, Butterworth, Calkins, Camp, Campbell, Candler, Cannon, Carpenter, Chace, Chapman, Clardy, Crapo, Cullen, Curtin, Darrall, Dawes, Daering, De Motte, Dezendort, Dingley, Dwight, Ellis, Ermentrout, Errett, Charles B. Farwell, Ford, George, Gibson, Godshalk, Grout, Guenther, Hall, Harmer, Henry S. Harris, Haseltine, Haskell, Hawk, Hazelton, Heilman, Henderson, Hepburn, G. W. Hewitt, Hill, Hiscock, Hoblitzell, Hoge, Horr, Hubbell, Hubbs, Humphrey, Jacobs, Phineas Jones, Jorgensen, Joyce, Kasson, Kelley, Kenna, Ketcham, Klotz, Lacey, Lewis, Lord, Lynch, Marsh, McClure, McKinley, McLane, Miller, Moore, Morey, Moss, Mosgrove, Murch, Mutchler, Neal, Norcross, O'Neill, Pacheco, Page, Payson, Peelle, Peirce, Pound, Prescott, Randall, Ranney, Ray, Reed, Theron M. Rice, William W. Rice, Rich, Ritchie, George D. Robinson, James S. Robinson, Ross, Russell, Ryan, Seaville, Scranton, Shallenberger, Shelley, Sherwin, Shultz, Skinner, A. Herr Smith, J. Hyatt Smith, Spear, Spooner, Steele, Stone, Strait, Talbott, Taylor, Thomas, William G. Thompson, Amos Townsend, Tyler, J. T. Updegraff, Upson, Valentine, Van Horn, Van Voorhis, Wadsworth, Wait, Walker, Ward, Watson, Webber, White, Charles G. Williams, Wilits, Wilson, George D. Wise, Morgan R. Wise, Walter A. Wood, Young—151.

NAYS—Aiken, Armfield, Atkins, Beach, Belford, Belmont, Beltzhoover, Berry, Bland, Blount, Bragg, Buchanan, Buckner, Caldwell, Carlisle, Clark, Clements, Cobb, Colerick, Cook, Samuel S. Cox, William R. Cox, Cravens, Culberson, Cutts, Davidson, Lowndes H. Davis, Deuster, Dibble, Dowd, Dunn, Dunnell, Evans, Sewell S. Farwell, Finley, Forney, Garrison, Gunter, N. J. Hammond, Hardenbergh, Hatch, Herbert, Herndon, Abram S. Hewitt, House, James K. Jones, King, Knott, Latham, Leedom, Le Fevre, Manning, Matson, McCoid, McKenzie, McMillin, Mills, Money, Morrison, Moulton, Muldrow, Oates, Orth, Phister, Reagan, Scales, Shackelford, Otho R. Singleton, Springer, Stockslager, P. B. Thompson, Tillman, R. W. Townshend, Tucker, Oscar Turner, Thomas Updegraff, Vance, Warner, Washburn, Wellborn, Whitthorne, Thomas Williams, Willie—88.

Nor Voting—Black, Blackburn, Blanchard, Cabell, Cassidy, Caswell, Converse, Cornell, Covington, Crowley, George R. Davis, Dibrell, Dugro, Fisher, Flower, Frost, Fulkerson, Geddes, John Hammond, Hardy, Benjamin W. Harris, Holman, Hooker, Houk, Hutchins, Jadin, George W. Jones, Ladd, Lindsey, Martin, Mason, McCook, Miles, Nolan, Parker, Paul, Pettibone, Phelps, John B. Rice, D. P. Richardson, John S. Richardson, Robertson, Robeson, William E. Robinson, Roscrans, Simonton, James W. Singleton, Dietrich C. Smith, Sparks, Spaulding, Stephens, Henry G. Turner, Urner, Van Aernam, West, Wheeler, Benjamin Wood—57.

So the bill was passed.

The Senate, on May 9th, as in Committee of the Whole, proceeded to consider the bill (H. R. No. 2,315) to provide for the appointment

of a commission to investigate the question of the tariff.

Mr. Morrill, of Vermont: "This is identically the same bill as the Senate passed, with these words only omitted: 'and existing system of internal-revenue laws.' Those words are left out, as I understand, for the purpose of leaving the Committee on Ways and Means of the House at liberty to propose a bill that will modify the internal-revenue laws."

Mr. Davis, of West Virginia: "I understand that the commissioners are to be confirmed by the Senate."

Mr. Morrill: "Yes, sir."

Mr. Beck, of Kentucky: "I advised that there was no necessity for any further delay in regard to this bill by referring it to the Committee on Finance. I was not aware, however, of one fact that I learn this morning, that in March, 1879, shortly before the Eaton bill was presented, Mr. D. J. Morrell, of Pennsylvania, was made president of the American Iron and Steel Association; he was a member of the House of Representatives at the time when the Bessemer steel duty was raised to \$28 a ton, and on taking the chair he advised the association thus:

"Demand that the subject shall be intrusted to a commission not of owl-eyed college professors, but of business men and statesmen appointed by the President of the United States, with instructions and authority to ascertain the condition and wants of all our industries, and to examine the tariff legislation of this and other countries with reference to its influence upon national welfare, and demand also that Congress shall refrain from legislation upon the subject until the presentation of the report of this commission. If no other good results from this, we shall at least have what the country most needs, a little rest.

"They will get 'a little rest' now for a couple of years, and maintain the present condition of things; and they have succeeded so well in getting a continuance that I do not suppose it is worth while to delay it."

The bill was reported to the Senate without amendment, ordered to a third reading, and read the third time.

The President *pro tempore*: "Shall the bill pass?"

The result was announced as follows:

YEAS—Aldrich, Allison, Anthony, Blair, Cameron of Wisconsin, Conger, Davis of West Virginia, Dawes, Frye, Gorman, Groome, Hale, Hampton, Harrison, Hawley, Hill of Colorado, Hoar, Johnston, Jones of Nevada, Kellogg, Lapham, McDill, McMillan, McPherson, Mahone, Miller of California, Miller of New York, Mitchell, Morrill, Platt, Rollins, Sawyer, Sewell, Sherman, Windom—85.

NAYS—Call, Cockrell, Coke, Davis of Illinois, Farley, George, Grover, Harris, Ingalls, Jackson, Jonas, Maxey, Morgan, Pugh, Slater, Vance, Van Wyck, Vest, Walker—19.

ABSENT—Bayard, Beek, Brown, Butler, Camden, Cameron of Pennsylvania, Chilcott, Edmunds, Fair, Ferry, Garland, Hill of Georgia, Jones of Florida, Lamar, Logan, Pendleton, Plumb, Ransom, Saulsbury, Saunders, Voorhees, Williams—22.

So the bill was passed. (See TARIFF REVISION.)

APPORTIONMENT OF REPRESENTATIVES.—IN

the House, on February 7th, the bill to apportion Representatives was considered.

Mr. Prescott, of New York: "The system upon which this bill is based is best set out in the letter of its originator, Mr. C. W. Seaton, from which I request the Clerk to read."

The Clerk read as follows:

The present tables differ from those contained in your letter of January 17, 1881, addressed to Hon. S. S. Cox, chairman of the Committee on the Census, House of Representatives, in that they are based upon the population as now finally determined, and in that the calculations have been made upon assumptions as to the total number of Representatives ranging from 275 to 350, both inclusive, the range in the original tables having been from 293 to 325.

While making these calculations I met with the so-called "Alabama paradox," where Alabama was allotted 8 Representatives out of a total of 299, receiving but 7 when the total became 300.

Such a result as this is to me conclusive proof that the process employed in obtaining it is defective, and that it does not in fact "apportion Representatives among the several States according to their respective numbers."

This conclusion has been confirmed by the discovery of other anomalies, and the result of my study of this question is the strong conviction that an entirely different process should be employed.

That heretofore used is the following:

The total representative population of the country is divided by the proposed total number of Representatives. The quotient obtained is "the ratio of Representatives to population," or, in better phrase for our present purpose, it is the number of inhabitants which would fall to each congressional district, were it possible to divide the whole country into districts exactly equal in population. This number may, for convenience in the discussion, be termed the *modulus*.

This modulus is then applied as a divisor to the population of the several States. The entire quotient thus obtained for each State, after rejecting the fraction, is evidently the minimum number of Representatives which can be assigned to such State (except in the case of a State having a population less than the modulus, each State being entitled to at least one Representative).

Making a preliminary allotment of minimums in this manner, the sum of the numbers so allotted will be less than the number of Representatives originally taken.

The difference must now be made up by increasing the allotment to certain States. It will result from such assignment, of course, that the average number of inhabitants to each Representative in the State to which additional Representatives are allotted will be less than the modulus, and that one or more of the districts formed in such State shall have less than their full quota. It is the mode of determining to which of the States the additional Representatives shall be assigned which I believe to be erroneous, and it is at this point that the variance between the process heretofore employed and the one which I now propose begins. (For the sake of convenience the two processes will hereafter be characterized respectively as the old and the new method.)

The old method compares the remainders left after the divisions above described, and assigns an additional Representative, first, to that State where the remainder after division was greatest; next, to the State where the remainder was next in size; and so on in order of rank of the remainders until the difference is made up. It is my opinion that it is not these remainders but rather the quotients which result from dividing the populations of the States by the increased number of Representatives which should govern the allotment, and that the additional Representatives

should be so assigned that the population of the districts formed in the State to which additional Representatives are allotted shall fall as little below the average number for the United States as possible; in other words, that the districts ultimately formed from the States so increased shall approximate as closely as possible in population to that of a district which should be formed by dividing the total population of the United States exactly by the proposed total number of Representatives. If it were true that districts each containing a population exactly equal to the ratio of Representatives to population for the United States must first be carved out of each State, and that enough districts to fill the quota were afterward to be made from the fragments left, then the old method of allotment would no doubt be the proper one. In that case the largest remaining fragments would necessarily receive the additional Representatives. But the practice and, so far as I know, the law has uniformly aimed to divide the States finally, after the number of Representatives for each State has been determined, in such manner that in each State the districts shall be as nearly equal to each other in population as possible.

Having, therefore, as before, made the preliminary allotment of minimums and ascertained the number of Representatives which must still be assigned, I would then determine, by trial, under what additional distribution the number of inhabitants per Representative in the States whose representation is increased would fall least below the ratio, and distribute accordingly.

Mr. Prescott: "Doubtless each member has carefully studied the explanation and tables, and I will spend no time in explanation further of same. The committee after careful consideration adopted this method, because they believed it embodied the intent and design of the Constitution, and apportioned the members among the several States according to their respective numbers.

"At 320, the number provided in this bill, Maine, New Hampshire, and Vermont lose 1 under any form of division; but as between the former method and the Seaton method, California, Florida, and Rhode Island each gain 1 by the old method which by the Seaton method they lose, and Illinois, New York, and Pennsylvania gain the same. In other words, Florida by the old method will have 134,746 to a member, Rhode Island 138,265 to a member, and California 144,115 to a member, in preference to giving these to the other three States, which would then have—Illinois, 146,565; Pennsylvania, 147,685; and New York, 149,496.

"By the old method you give it to the largest fraction, by the Seaton method you obtain equality of representation as nearly as is possible. As between the methods there is no dispute or uncertainty, but one question presented is whether New York with her 5,082,871 inhabitants, with an assessed valuation of property subject to taxation of \$2,686,139,133, whose citizens hold \$210,264,250 of the nation's bonds, or about one third of all held by citizens of the United States, being nineteen times as many as are held in California, fifty-two times as many as are held in Rhode Island, eight hundred and thirty-one times as many as in Florida; who represent one fifth of the

bank capital of the country, and have and use one quarter of its entire circulation; whose citizens hold nearly three fourths of the whole gold certificates of the Government, and within whose State limits were collected in 1881 \$141,958,855.90 of the customs, or nearly three fourths of all in the country; whose banks paid the Government \$2,042,838 in taxes, or one fourth of all paid; the citizens of which pay \$17,233,393.75, or one eighth of the internal revenue of the Treasury, shall by a just apportionment, according to numbers, because of the largest ratio of apportionment, receive an increase of one thirty-third of her representation, or shall California receive an increase of one fifth, Florida of one half, or Rhode Island one half, as you shall give to one of them the Representative taken from New York.

"Rhode Island, with only 276,531; Florida, with only 269,493; and California, with 864,694, are each the equal of New York now in the Senate, and will continue to be, although her 5,082,871 should become 10,000,000. In one branch of the Government they stand her equal in legislative power, and, while their combined population is but a fraction of hers, their voice is three times as potential.

"Am I met with the claim that wealth, the sinew for the support of the Government and her bulwark of defense, counts nothing in representation?

"That such was not the design of the founders of the Constitution, is self-evident. Taxation and representation they considered joint factors in their blows for freedom. They reiterated it in the original wording of the Constitution:

"Representation and direct taxes shall be apportioned among the several States . . . according to their respective numbers.

"But they went further, when they added:

"Which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three fifths of all other persons.

"This added three fifths of the described personal property of the States to make up the representative population of the States. This property in 1790 had 12 Representatives; in 1800, 16; in 1810, 20; in 1820, 22; in 1830, 25; in 1840, 21; in 1850, 20; in 1860, 18, and it may be her material wealth and position in the Union in 1790 gave Massachusetts her extra 3, in 1800 her extra 5, in 1810 her extra 7 and New York her 2, in 1820 Alabama and Virginia their 1 additional. Be that as it may, this is not a new claim. In 1791 Mr. Barnwell asserted that extent of territory should be regarded in apportionment. Mr. Giles in 1792 contended 'that a full and large representation was necessary to give the landed interest of the country its proportion of power,' and Mr. Quincy in 1810 asserted that apportionment 'ought to be made, not merely in relation to population, but the weight of the different States in the

Union.' The same will be found in each decade of later date, and forms a reason why the Representatives of other States upon this floor should act equitably and deal justly with New York, which, though originally the fifth State of this Union, stands to-day, as she has since 1820, the first in the galaxy of States."

Mr. Robinson, of Massachusetts: "I shall address myself to one particular feature of this bill, because the question of the total number of the House will be discussed by other gentlemen at length. I wish to speak of the distribution.

"It will be noticed on examination, as has been stated by my friend from New York, that the only States that are affected in that distribution by the choice of the old method or the new method are six. Take the table that is given to us by Mr. Seaton, of the Census Office, under the number 320 you will find the column that gives the numbers to the different States under the old method first and then under the new. Following down this column of figures you will observe, for the figures catch the eye readily, that no States are affected differently from what they were under the former computation, except Florida, Rhode Island, California, Pennsylvania, New York, and Illinois.

"Now, if the number fixed in this bill, 320, is right—and as to the discussion of methods we will take it that it is—starting with that number as your basis, how will you apportion it? Shall we take the old way, or shall we take the new? Certainly let us take the new if it is better, if it is more just and equitable; but let us scan it very closely before we do adopt it and discard the old method, which has been heretofore considered just and equitable.

"Now, in the last Congress when the bill for 319 members was introduced—and the total number is not a matter of consequence in this immediate connection—the apportionment was made on the old method; and I find that the gentleman from New York (Mr. Cox), who was at that time the chairman of the Committee on the Census, said after assigning the number of Representatives, that is, taking out the even numbers in the first place from the total numbers and assigning them to the States, then he would assign the balance according to the old method, and said:

"The difference according to the best and most equitable recent practice should be made up by assigning to the States having the largest fractions additional Representatives.

"Now, on that basis of operation let us see how we will manage. In the first place, we take the entire number of members; say 320 is the number fixed upon. The population of the United States, leaving out those that should be excluded, foots up 49,371,200. Dividing that population by the number of Representatives fixed in the bill, and you will have a quotient of 154,285 to each Representative. That is the precise number. Now, you are to take that number, 154,285, and go around with it

and measure up the population of the States. That is what the Constitution says—that Representatives shall be apportioned among the several States according to their respective numbers; and you take that, as I say, and measure the population of each State by it. You go, for instance, into the State of Georgia, and you find that you have a certain number as the Representatives to be assigned to that State; but after that you have a fraction. Going around to all the States in the same way, and assigning Representatives on even numbers according to this division, and you will find that your footings up will not reach 320, for in all of the States there will be a remainder after the first division. Now, how will you supply that remainder?

"The old method was to take the fractions next in order approaching nearest to the number of population required, and assign the remaining members to those fractions. Now, we thought that to be right. There was no objection to that rule. The people of the country have assented to it as just and proper. Even in the last Congress, when the communication from the Census Office came in and laid down that principle as the method of operating, nobody got up in the House and let out this great flood of new light and suggested this new order of things with which we are met to-day. That was regarded as a proper principle. No objection was made to it, and nobody ever heard of this new plan before.

"Now, Mr. Speaker, how is it that the new method proposes to get at the number of members? What is the result? I submit to the Speaker and to the House that it is always a fair test of any question to stop and look back at your result after you get there; for somehow or other there comes a conviction if your result, when your attention is called to it, does not look right, that there must be something wrong in the argument, something the matter with the process.

"Now, when you take up this table, as presented by the committee and advocated by the gentleman from New York, what do you find? When you find that Florida, Rhode Island, and California are to give up one Representative each, you begin to grow a little doubtful as to whether your process is right or not; but when you learn in addition to that that they are not only to surrender it themselves but that they are to lay it down in the laps of Illinois, Pennsylvania, and New York, then I am pretty well convinced that it is wrong. Now, is it not wrong? The great States of this Union are able to take care of themselves on this floor."

Mr. Briggs, of New Hampshire: "They are trying to do it in this bill."

Mr. Robinson: "My friend from New Hampshire says they are trying to do it. No, sir. There are gentlemen in those great States, I believe, who will not support this claim and will not gather power to themselves or to their

States on this floor by sacrificing the weaker. Gentlemen whose States are not affected directly by this computation will not stand tamely by and let this go unheeded. Massachusetts has no interest directly whether the apportionment be under the one method or the other, but she is interested with the other States—not in her section, for the sections are divided in the extreme; no places could be more remote than California, Florida, and Rhode Island in this great Union—she is interested, I say, that those other States shall be justly dealt with.

"What is proposed here? The gentleman recommending this method speaks of the Alabama paradox; and because under a certain method of figuring there seemed to be something that surprised one, that is an argument for abandoning the old scheme. Now, there will be found to be paradoxes in the new scheme."

Mr. Bayne, of Pennsylvania: "I defy the gentleman to point out one."

Mr. Robinson: "I accept the gentleman's defiance right here, because it is a peaceable defiance. What is the plan? It is to take those numbers of the population of the great States and so divide them up, it is said, that the numbers shall be as near as possible all over the country to the maximum number, 154,285.

"Let us see what the gentleman says who is the parent of the scheme. After commenting upon the old method, he says—I read from the communication of Mr. C. W. Seaton, chief clerk of the Census Office:

"It is my opinion that it is not these remainders, but rather the quotients which result from dividing the populations of the States by the increased number of Representatives, which should govern the allotment, and that the additional Representatives should be so assigned that the population of the districts formed in the State to which additional Representatives are allotted shall fall as little below the average number for the United States as possible; in other words, that the districts ultimately formed from the States so increased shall approximate as closely as possible in population to that of a district which should be formed by dividing the total population of the United States exactly by the proposed total number of Representatives.

"Unless this is in some other language than the English, I have stated it right. But let us look at some of the results. We want paradoxes, it seems.

"Now, I have some figures here just as they are given under the old method. With six Representatives for California each would stand for 144,615 persons. In Florida, with her two Representatives, each would stand for 134,746. In Rhode Island, with her two Representatives, each would stand for 138,265. In New York, with thirty-three Representatives, each would stand for 154,026. In Pennsylvania, with twenty-eight Representatives, each would stand for 152,960. In Illinois, with twenty Representatives, each would stand for 153,893. That is under the old method. Now, Mr. Speaker,

it is apparent that those numbers are pretty nearly alike, while varying somewhat.

"I will now go over to the new method and see how it will bear the same comparison. In California, with five Representatives, each must stand for 172,938. In Florida, with one Representative, that one Representative must stand for 269,493 persons. Paradox No. 1! In Rhode Island, with her one Representative, that one man must stand for 276,531 persons. Paradox No. 2! In New York, with thirty-four Representatives, each one will stand for 149,496. In Pennsylvania, each will stand for 147,685, and in Illinois each will stand for 146,565.

"Now, at first blush, does anybody think that is right? Is that a fair representation of the people of the United States? I know they raise able and brilliant men in Rhode Island. I do not believe they raise any one quite smart enough to overlie that whole State and have superfluous energy enough to represent 276,531 people on the scale of 154,285. The comparison shows that Pennsylvania and New York are not quite up to that standard, and they want more men.

"There is another statement. Under the old method the California members would each represent 9,670 people less than the full number. The Florida members would each represent 19,869 less than the full number. The Rhode Island members would each represent 16,020 less than the full number. The New York members would each represent 159 less than the full number. The Pennsylvania members would each represent 1,325 less than the full number. The Illinois members would each represent 392 less than the full number.

"Now go to the new method. California: each man would represent 18,653 more than the full number. Florida: its member would represent 105,208 more than the full number. Rhode Island: its member would represent 122,246 more than the full number. Now look at the other three States. New York: each member would represent 4,789 less than the full number. Pennsylvania: each member would represent 6,600 less than the full number. And Illinois: each member would represent 7,720 less than the full number."

Mr. Calkins, of Indiana: "That is, in each district?"

Mr. Robinson: "I am speaking of the number for each Representative. Is that equality of representation? Do you want any more paradoxes?"

"I suppose it is not seriously claimed, Mr. Speaker, in this House, that the wealth of any State shall ultimately determine the ratio of representation. Much may be pardoned to the gentleman from New York, of course, for his pride in his State. We all have the same pride in our respective States. We find something very dear to us in the people we represent upon this floor. That is all right. It is right

for us to have that pride and deep sense of honor. But, after all, when the fathers wrote in the Constitution that the Representatives should be apportioned among the several States according to their respective numbers, they did not make it within the power of this Congress thereafter to prescribe the qualification of wealth, nor that the members who sit here should be able to make their qualifications secure by presenting the roll of their bonds or of the acres of their lands. I have proposed an amendment to the bill to strike out the first section and to replace it with a new first section, making the number 320, because, as I said, I did not propose to discuss that question of the total number. What I may choose to vote by-and-by, in regard to the whole number of the House, is not of importance in my present consideration. But I ought to say, perhaps, that as little increase as practicable from the present number I believe to be wise.

"Of course we have given a great deal of consideration in this hall during the last Congress to this subject. We find that taking different parts of the country, and making the allotments to the several States, the number 319 would be practically fair and equal. But 320 differs from that so little that it does not seem to me that we would make much by any long discussion as to what should be the total number. I want to say that I have not only recognized that full number in the amendment which I have offered, but I have made the amendment to correspond to the line of my argument.

"That is, I have said to Pennsylvania, New York, and Illinois, you are entitled to one less each under this old scheme; and to the States of Florida, Rhode Island, and California, you ought to have one more. In other words, I say that the new method proposed is so wretchedly and palpably at fault, is so unjust to the three States last named by me, and does more than justice to the three States first named, that we ought not adopt it, but should rather retain the old one."

Mr. Mills, of Texas: "Mr. Speaker, the primal, central object of the provision in the Constitution requiring a census of the population of the States to be taken every ten years was to afford a basis for the distribution of political power. This is a representative government, and our fathers in forming this government were careful to provide for a correct representation of its people. They have laid down a defined method of representation in this House; and that political power which is the safeguard of their liberties and the safeguard of the liberties and rights of their children they have said shall be distributed among the people of the States in proportion to their numbers."

The Speaker: "The next amendment in order is that offered by the gentleman from Kansas (Mr. Anderson), which will be read."

The Clerk read as follows:

Strike out all of section 1, after the enacting clause, and insert these words:

"That after the 3d of March, 1883, the House of Representatives shall be composed of 325 members, to be apportioned among the several States as follows: Alabama, 8; Arkansas, 5; California, 6; Colorado, 1; Connecticut, 4; Delaware, 1; Florida, 2; Georgia, 10; Illinois, 20; Indiana, 13; Iowa, 11; Kansas, 7; Kentucky, 11; Louisiana, 6; Maine, 4; Maryland, 6; Massachusetts, 12; Michigan, 11; Minnesota, 5; Mississippi, 7; Missouri, 14; Nebraska, 3; Nevada, 1; New Hampshire, 2; New Jersey, 7; New York, 34; North Carolina, 9; Ohio, 21; Oregon, 1; Pennsylvania, 28; Rhode Island, 2; South Carolina, 7; Tennessee, 10; Texas, 11; Vermont, 2; Virginia, 10; West Virginia, 4; Wisconsin, 9."

The Speaker: "The question is on the amendment offered by the gentleman from Kansas (Mr. Anderson), which has just been read."

Mr. Sherwin, of Illinois: "Some members do not understand how many members are proposed in that amendment."

The Speaker: "Three hundred and twenty-five."

Mr. Thompson, of Kentucky: "I rise to a parliamentary inquiry. I wish to know whether these three hundred and twenty-five members are by this amendment apportioned according to the new or the old method."

Mr. Prescott: "The old method."

The question was taken; and it was decided in the affirmative, as follows:

YEAS—Aiken, Aldrich, Anderson, Barr, Bayne, Beach, Beltzhoover, Bingham, Bowman, Bragg, Brewer, Briggs, Browne, Brumm, Buck, Julius C. Burrows, Joseph H. Burrows, Butterworth, Calkins, Campbell, Candler, Cannon, Carpenter, Caswell, Chace, Crapo, Crowley, Culberson, Cullen, Davidson, George R. Davis, Dawes, Deering, De Motte, Deuster, Dezen-dorf, Dingley, Dunnell, Ellis, Errett, Evins, Sewell S. Farwell, Finley, Ford, Fulkerson, George, Godshalk, Grout, Guenther, Hall, John Hammond, Harner, Benjamin W. Harris, Haseltine, Haskell, Hawk, Hazelton, Heilman, Henderson, Hepburn, Hill, Hiscok, Hoblitzell, Horr, Houk, Hubbell, Hubbs, Humphrey, Jacobs, Jadwin, George W. Jones, Phineas Jones, Joyce, Kasson, Kelley, Lacey, Lewis, Lindsey, Lord, Marsh, Mason, McClure, McCoid, McCook, McKinley, McLane, Miles, Miller, Mills, Moore, Morey, Neal, Norcross, O'Neill, Orth, Pacheco, Page, Parker, Paul, Payson, Peelle, Pierce, Pettibone, Pound, Prescott, Ranney, Ray, Reagan, Reed, John B. Rice, Theron M. Rice, William W. Rice, Rich, D. P. Richardson, John S. Richardson, Ritchie, Robertson, Robeson, George D. Robinson, James S. Robinson, Russell, Ryan, Scranton, Shallenberger, Shelley, Sherwin, Shultz, Skinner, A. Herr Smith, Dietrich C. Smith, Spaulding, Speer, Spooner, Steele, Stone, Strait, Taylor, Thomas, William G. Thompson, Tillman, Amos Townsend, Tyler, J. T. Updegraff, Thomas Updegraff, Upson, Urner, Valentine, Van Aernam, Van Horn, Wadsworth, Wait, Walker, Ward, Washburn, Watson, Webber, Wellborn, West, Charles G. Williams, Willits, Walter A. Wood, Young—163.

NAYS—Armfield, Atkins, Barbour, Belmont, Berry, Black, Blackburn, Blanchard, Bland, Bliss, Blount, Buchanan, Buckner, Cabell, Caldwell, Carlisle, Cassidy, Chalmers, Chapman, Clardy, Clark, Clements, Cobb, Colerick, Converse, Cook, Samuel S. Cox, William R. Cox, Covington, Cravens, Curtin, Darrell, Lowndes H. Davis, Dibrell, Dowd, Dugro, Flower, Forney, Garrison, Geddes, Gunter, N. J. Hammond, Hardenbergh, Hardy, Henry S. Harris, Hatch, Herbert, Abram S. Hewitt, G. W. Hewitt, Goe, Holman, Hooker, House, Hutchins, James K. Jones, Kenna,

King, Klotz, Knott, Ladd, Latham, Leedom, Le Fevre, Manning, Martin, Matson, McKenzie, McMillin, Morrison, Mosgrove, Moulton, Muldrow, Murch, Mutchler, Oates, Phelps, Phister, Randall, William E. Robinson, Rosecrans, Scales, Seville, Shackelford, Simon-ton, James W. Singleton, Otho R. Singleton, Sparks, Springer, Stockslager, Talbot, P. B. Thompson, Tucker, Henry G. Turner, Oscar Turner, Vance, Warner, Wheeler, White, Whitthorne, Thomas Williams, Willis, Wilson, George D. Wise, Morgan R. Wise—104.

NOT VOTING—Allen, Atherton, Belford, Camp, Cornell, Cutts, Dibble, Dunn, Dwight, Ermentrout, Charles B. Farwell, Fisher, Frost, Gibson, Herndon, Jorgensen, Ketcham, Money, Morse, Nolan, Ross, J. Hyatt Smith, Stephens, R. W. Townsend, Van Voorhis, Benjamin Wood—26.

So the amendment was agreed to, and the bill passed in that form.

In the Senate, on February 21st, the bill was passed without amendment.

The bill as passed, was as follows:

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That after the third of March, eighteen hundred and eighty-three, the House of Representatives shall be composed of three hundred and twenty-five members, to be apportioned among the several States as follows: Alabama, 8; Arkansas, 5; California, 6; Colorado, 1; Connecticut, 4; Delaware, 1; Florida, 2; Georgia, 10; Illinois, 20; Indiana, 13; Iowa, 11; Kansas, 7; Kentucky, 11; Louisiana, 6; Maine, 4; Maryland, 6; Massachusetts, 12; Michigan, 11; Minnesota, 5; Mississippi, 7; Missouri, 14; Nebraska, 3; Nevada, 1; New Hampshire, 2; New Jersey, 7; New York, 34; North Carolina, 9; Ohio, 21; Oregon, 1; Pennsylvania, 28; Rhode Island, 2; South Carolina, 7; Tennessee, 10; Texas, 11; Vermont, 2; Virginia, 10; West Virginia, 4; Wisconsin, 9.

SECTION 2. That whenever a new State is admitted to the Union the Representative or Representatives assigned to it shall be in addition to the number three hundred and twenty-five.

SEC. 3. That in each State entitled under this apportionment the number to which such State may be entitled in the Forty-eighth and each subsequent Congress shall be elected by districts composed of contiguous territory, and containing as nearly as practicable an equal number of inhabitants, and equal in number to the Representatives to which such State may be entitled in Congress, no one district electing more than one Representative: *Provided*, That unless the Legislature of such State shall otherwise provide before the election of such Representatives shall take place as provided by law, where no change shall be hereby made in the representation of a State, the Representatives thereof to the Forty-eighth Congress shall be elected therein as now provided by law. If the number as hereby provided for shall be larger than it was before this change, then the additional Representative or Representatives allowed to said State under this apportionment may be elected by the State at large, and the other Representatives to which the State is entitled by the districts as now prescribed by law in said State; and if the number hereby provided for shall in any State be less than it was before the change hereby made, then the whole number to such State hereby provided for shall be elected at large, unless the Legislatures of said States have provided or shall otherwise provide before the time fixed by law for the next election of Representatives therein.

All acts and parts of acts inconsistent herewith are hereby repealed.

PRESIDENTIAL ELECTORS.—Article II of the Constitution of the United States declares: "Each State shall appoint, in such manner as

the Legislature thereof may direct, a number of electors equal to the whole number of Senators and Representatives to which the State may be entitled in Congress," etc. The number of presidential electors under the above-mentioned apportionment of Representatives is as follows:

Alabama, 10; Arkansas, 7; California, 8; Colorado, 3; Connecticut, 6; Delaware, 3; Florida, 4; Georgia, 12; Illinois, 22; Indiana, 15; Iowa, 13; Kansas, 9; Kentucky, 13; Louisiana, 8; Maine, 6; Maryland, 8; Massachusetts, 14; Michigan, 13; Minnesota, 7; Mississippi, 9; Missouri, 16; Nebraska, 5; Nevada, 3; New Hampshire, 4; New Jersey, 9; New York, 36; North Carolina, 11; Ohio, 23; Oregon, 3; Pennsylvania, 30; Rhode Island, 4; South Carolina, 9; Tennessee, 12; Texas, 13; Vermont, 4; Virginia, 12; West Virginia, 6; Wisconsin, 11. Total, 401.

**RIVER AND HARBOR BILL.**—In the House, the bill making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes, was passed on July 26th, by the adoption of the final report of the committee of conference with the Senate committee.

On August 1st, President Arthur returned it to the House, with the following objections:

*To the House of Representatives:*

Having watched with much interest the progress of House bill No. 8,242, entitled "An act making appropriations for the construction, repair, and preservation of certain works on rivers and harbors, and for other purposes," and having since it was received carefully examined it, after mature consideration I am constrained to return it herewith to the House of Representatives in which it originated, without my signature and with my objections to its passage.

Many of the appropriations in the bill are clearly for the general welfare and most beneficial in their character. Two of the objects for which provision is made were by me considered so important that I felt it my duty to direct to them the attention of Congress. In my annual message in December last, I urged the vital importance of legislation for the reclamation of the marshes and for the establishment of the harbor lines along the Potomac front. In April last by special message I recommended an appropriation for the improvement of the Mississippi River. It is not necessary that I say that when my signature would make the bill appropriating for these and other valuable national objects a law, it is with great reluctance and only under a sense of duty that I withhold it.

My principal objection to the bill is that it contains appropriations for purposes not for the common defense or general welfare, and which do not promote commerce among the States. These provisions, on the contrary, are entirely for the benefit of the particular localities in which it is proposed to make the improvements. I regard such appropriation of the public money as beyond the powers given by the Constitution to Congress and the President.

I feel the more bound to withhold my signature from the bill because of the peculiar evils which manifestly result from this infraction of the Constitution. Appropriations of this nature, to be devoted purely to local objects, tend to an increase in number and in amount. As the citizens of one State find that money, to raise which they in common with the whole country are taxed, is to be expended for local improvements in another State, they demand similar benefits for themselves, and it is not unnatural that they should seek to indemnify themselves for such use of the public funds by securing appropriations for similar improvements in their own neighborhood. Thus as the bill becomes more objectionable it se-

cures more support. This result is invariable, and necessarily follows a neglect to observe the constitutional limitations imposed upon the law-making power.

The appropriations for river and harbor improvements have, under the influence to which I have alluded, increased year by year out of proportion to the progress of the country, great as that has been. In 1870 the aggregate appropriation was \$3,975,900; in 1875, \$6,648,517.50; in 1880, \$8,976,500; and in 1881, \$11,451,000, while by the present act there is appropriated \$18,743,875.

While feeling every disposition to leave to the Legislature the responsibility of determining what amount should be appropriated for the purposes of the bill, so long as the appropriations are confined to objects indicated by the grant of power, I can not escape the conclusion that, as a part of the law-making power of the Government, the duty devolves upon me to withhold my signature from a bill containing appropriations which in my opinion greatly exceed in amount the needs of the country for the present fiscal year. It being the usage to provide money for these purposes by annual appropriation bills, the President is in effect directed to expend so large an amount of money within so brief a period that the expenditure can not be made economically and advantageously.

The extravagant expenditure of public money is an evil not to be measured by the value of that money to the people who are taxed for it. They sustain a greater injury in the demoralizing effect produced upon those who are intrusted with official duty through all the ramifications of Government.

These objections could be removed and every constitutional purpose readily attained should Congress enact that one half only of the aggregate amount provided for in the bill be appropriated for expenditure during the fiscal year, and that the sum so appropriated be expended only for such objects named in the bill as the Secretary of War, under the direction of the President, shall determine; provided that in no case shall the expenditure for any one purpose exceed the sum now designated by the bill for that purpose.

I feel authorized to make this suggestion because of the duty imposed upon the President by the Constitution "to recommend to the consideration of Congress such measures as he shall judge necessary and expedient"; and because it is my earnest desire that the public works which are in progress shall suffer no injury. Congress will also convene again in four months, when this whole subject will be open for their consideration.

CHESTER A. ARTHUR.

EXECUTIVE MANSION, August 1, 1882.

In the House, on August 2d, Mr. Page, of California, from the Committee on Commerce, moved to take up the bill with the President's veto message. This was taken up, and on the question of its passage the vote was as follows:

YEAS—Atkins, Barbour, Bayne, Bingham, Blackburn, Blanchard, Bliss, Bowman, Brewer, Buck, Buckner, Julius C. Burrows, Butterworth, Cabell, Calkins, Candler, Cannon, Carpenter, Chapman, Clements, Crapo, Cravens, Culberson, Cullen, George R. Davis, Dawes, De Motte, Deuster, Dibrell, Dunn, Dunnell, Ellis, Errett, Evins, Sewell S. Farwell, Ford, Forney, Fulkerson, Garrison, George, Gibson, Guenther, Gunter, John Hammond, Harmer, Benjamin W. Harris, Henry S. Harris, Haseltine, Hatch, Hazelton, Henderson, Hepburn, Herndon, Hoblitzell, Hoge, Horr, House, Hubbell, George W. Jones, James K. Jones, Kenna, King, Latham, Lewis, Lord, Lynch, Mackey, Manning, McClure, McCoid, McLane, McMillin, Mills, Oates, O'Neill, Page, Parker, Payson, Pierce, Phelps, Pound, Reagan, John

B. Rice, Theron M. Rice, William W. Rice, Rich, D. P. Richardson, Ritchie, Robertson, Robeson, Roscrans, Ross, Shallenberger, Sherwin, Simonton, Otho R. Singleton, Smalls, Spaulding, Speer, Spooner, Stephens, Stone, Strait, Talbot, Taylor, Amos Townsend, Tucker, Upson, Urner, Vance, Van Aernam, Van Horn, Wait, Ward, Washburn, Weber, Wellborn, White, Charles G. Williams, Thomas Williams, Wilson, George D. Wise—122.

NAYS — Anderson, Belmont, Blount, Briggs, Browne, Brumm, Buchanan, Caldwell, Campbell, Colerick, Converse, Samuel S. Cox, Deering, Dingley, Ermentrout, Fisher, Godshalk, N. J. Thompson, Valentine, Van Voorhis, Wadsworth, Walker, Watson, West, Morgan R. Wise, Benjamin Wood, Walter A. Wood—108.

**RETIREMENT OF ARMY OFFICERS.** — In the House, on March 31st, the army appropriation bill being under consideration, Mr. Butterworth, of Ohio, said: "Mr. Chairman, I propose, if it please the committee, first to explain this bill, especially in relation to important changes.

"In connection with the clause providing for pay of the army, there is a clause relating to honorable retirement, or, to use a phrase more common, compulsory retirement. The language is as follows:

That on and after the passage of this act all officers in the army who are over sixty-two years of age shall be placed on the retired list; and no act now in force shall be so construed as to limit or restrict the retirement of officers as herein provided for.

"It is proper to say in this connection that the Military Committee propose to offer an amendment or two, a part of which I am instructed by the Committee on Appropriations to accept. This clause has been inserted here, the committee deeming it to be in order, to accomplish what has been desired for fifty years by the army and all those who desire to secure its efficiency. It is the concurrent testimony of officers in the army, old and young, that this clause, or a similar clause, is indispensable to secure that efficiency in the army

which is desirable; and, beyond that, to secure that justice to junior officers which ought not to be withheld.

"I have this additional word to say touching this clause, and then I shall not refer to it again unless in the course of general debate it shall become necessary. It is the history not only of our own country but of the world, that before armies in the field have been relieved from the command of aged and incompetent generals, before officers rendered incompetent for the arduous duties of the field could be weeded out by the necessities of the service, necessities which forced themselves on the attention of the law-making power or the power having authority to provide a remedy, thousands of men, soldiers, have been sacrificed, vicarious offerings on the altar of age and resulting incompetency. It was so at the beginning of our own conflict, and history but repeats itself in each war. It is true this is a time of profound peace, but it is wisely ordered that in time of peace we should provide for war.

"I have said this is the unanimous voice of all the officers of the army. So it is not only of those who would be promoted but of those who would be retired as well. This clause provides for the honorable retirement of those who have either served faithfully forty years in the service or have attained to the age of sixty-two years."

Subsequently, on April 4th, Mr. Henderson, of Illinois, by instruction of the Military Committee, offered the following amendment:

Strike out all of the pending paragraph after the word "act," in the seventy-eighth line of the same, and insert the following provisions:

"When an officer has served thirty-five years, either as an officer or soldier, in the regular or volunteer service, he shall, if he make application therefor to the President, be retired from active service and placed on the retired list; and when an officer has served forty years, either as an officer or soldier, in the regular or volunteer service, or is sixty-two years of age, he shall be retired from active service and placed on the retired list: *Provided, however,* This last provision shall not apply to the General, Lieutenant-General, and present major-generals of the army; and no act now in force shall be so construed as to limit or restrict the retirement of officers as herein provided for."

This was again amended, on motion of Mr. Butterworth, as follows:

*Provided, however,* This last provision shall not apply to the General, Lieutenant-General, and present major-generals of the army.

The amendment was then adopted, and the bill passed and sent to the Senate.

In the Senate, on June 6th, several amendments were adopted, one of which changed the age of retired officers from sixty-two to sixty-four years. In a conference committee of the two Houses, the following provision was accepted and adopted:

That on and after the passage of this act, when an officer has served forty years, either as an officer or

soldier in the regular or volunteer service, or both, he shall, if he make application therefor to the President, be retired from active service and placed on the retired list; and when an officer is sixty-four years of age, he shall be retired from active service and placed on the retired list: *Provided further*, That the General of the Army, when retired, shall be retired without reduction in his current pay and allowances; and no act now in force shall be so construed as to limit or restrict the retirement of officers as herein provided for: *Provided further*, That any officer who is supernumerary to the permanent organization of the army as provided by law may, at his own request, be honorably discharged from the army, and shall thereupon receive one year's pay for each five years of his service, but no officer shall receive more than three years' pay in all.

**COMMON PRIME MERIDIAN.**—In the House, on June 6th, the following joint resolution was considered:

Joint resolution to authorize the President of the United States to call an international conference to fix on and recommend for universal adoption a common prime meridian to be used in the reckoning of longitude and in the regulation of time throughout the world.

The Speaker: "The question recurs on ordering the joint resolution to be engrossed and read the third time."

Mr. Flower, of New York: "Mr. Speaker, this joint resolution was introduced by myself and referred to the Committee on Foreign Affairs. There are over three thousand scientists in this country who ask the passage of this resolution. It was drawn up by General Hazen, and is distinctively an American measure. If this convention is not convened by us it will be by other nations. It will not cost the Government one dollar."

Mr. Carlisle, of Kentucky: "I would like to ask the gentleman from New York if he will not accept such an amendment to this joint resolution as will provide for the appointment of these delegates by the President either from the officers of the navy or from the Engineer Corps? These are already paid by the Government of the United States, and there is no necessity for subjecting the Treasury to additional expense in the selection of such a board from outside scientists, when officers capable of performing the service are already being paid by the Government. We have a board of competent officers connected with the Observatory, the Coast Survey, and the Engineer Corps of the army, from whom such selections could be made."

Mr. Kasson, of Iowa: "The scientific people of the country are almost unanimous in their recommendations touching the importance of this matter. I have a letter myself from President Barnard, of Columbia College, New York, and have seen papers from others, who suggest that it should be left to the discretion of the President to select this board."

Mr. Belmont, of New York: "I do not think that necessarily any compensation will be paid to the delegates. The delegates from

foreign governments will, of course, look to their own governments. Our own delegates will only be three in number."

Mr. Flower: "I desire to have printed as part of my remarks the report submitted by my colleague (Mr. Belmont) from the Committee on Foreign Affairs."

The report is as follows:

The Committee on Foreign Affairs, to whom was referred joint resolution No. 209, authorizing the President to call an international congress to fix and recommend a common prime meridian, having had the same under consideration, make the following report:

There is at present no common and accepted standard for the computation of time for other than astronomical purposes. In the absence of agreement serious embarrassments are felt in the ordinary affairs of modern commerce, especially since the wide-spread extension of telegraphic communication and railroad transportation, and, owing to the diversity of methods now in use for indicating points on the earth's surface, navigators, geographers, and all who have occasion to use charts or maps, are put to the greatest inconvenience. International agreement upon this subject is demanded more imperatively every day, both by science and by trade. We have had as provisional or partial standards the meridians of Alexandria, the Canary Islands, Toledo, Cracow, Uranbourg, Copenhagen, Goetz, Pisa, London, Paris, Rome, Greenwich, Vienna, Ulm, Berlin, Nuremberg, Venice, Bologna, Augsburg, Rouen, Dantsic, Milan, Washington, and other places. As long ago as the time of Richelieu, an attempt was made to put an end to the confusion arising out of so great a variety of usages, and a congress was invited to assemble in Paris, in 1630, to agree, if possible, upon a common meridian. In speaking of this congress, Professor Barnard, of Columbia College, says:

"The Island of Ferro, the most southwesterly of the Canary Islands, was fixed upon, and a royal order establishing this decision was promulgated in July of the same year. Unfortunately, however, the exact latitude of Ferro with reference to any point on the continent of Europe was at that time unknown. The determination of its position was never made by authority, and at length, in 1724, it was resolved to assume it as 20° west from Paris. To name the island, therefore, without naming the point in it, was to leave the meridian unfixed, even had its general position been better known; at any rate this effort to establish uniformity was without practical result."

The Government has by section 435 of the Revised Statutes adopted the Greenwich meridian for nautical purposes, but the establishment of the Meteorological Bureau and Signal-Service system, with postal and other stations extending over nearly four hours of solar time in North America, has already compelled the adoption of the standard time of 7.35 A. M. at Washington, as the moment of making telegraphic reports from all stations, and the observations on our naval vessels are made at the same hour of Washington time. There is already pending in this Congress a measure (H. R. 5009) for securing national standard time to our ports of entry and principal cities. This would accomplish what is desired in the regulation of time in the United States, and might be incorporated in any internal system to be adopted, but the remaining points as to the construction of charts and the reckoning of longitudes would require the concurrence of other nations, and could only be determined by an international convention.

The propositions embodied in this resolution have been discussed in this country and in Europe by various commercial and scientific bodies, and the necessity for an international convention is generally conceded. At the recent meeting in Cologne and Venice, the idea of holding such a convention in

Washington was very much favored. It is obvious that the United States, having the greatest extent of continuous longitudinal area of any country traversed by railway, postal, and telegraph lines, should take the initiative in a movement so important to science and to the world's commerce. The committee therefore recommend the passage of the joint resolution.

The joint resolution was read the third time, and passed. It subsequently passed the Senate without amendment.

**POLITICAL ASSESSMENTS.**—In the Senate, on June 26th, Senator Pendleton, of Ohio, called up the following resolution relative to political assessments, which was offered by him on June 5th.

*Resolved*, That the Committee on Civil Service and Retrenchment be instructed to inquire whether any attempt is being made to levy and collect assessments for political partisan purposes from any employés of the Government in Washington, whether the same be under the guise of asking voluntary contributions or otherwise, and to report to the Senate by bill or otherwise, in its discretion.

Mr. Pendleton: "Mr. President, when I offered this resolution two or three weeks ago, I was anxious for information. I did not know the state of facts as they existed at that time. I had seen in the newspapers that the Republican Congressional Committee was about to take means to replenish its funds, and vague intimations were given that a circular under the form of a request for voluntary contributions, but in fact a demand for specific sums of money, was being distributed among the employés of departments and the employés of the two Houses of Congress. I had also heard that this circular was backed by authority, and that its language conveyed covert promises, which implied threats, in case the demands were not acceded to.

"I was quite astonished, somewhat startled, when I found that this resolution met with objection. I had supposed that no Senator would object to having the truth discovered as to this circular and its intent; and certainly that no Senator would object to the inquiry whether forced contributions were being levied under the guise of invitations for voluntary contributions. Mr. President, I was not quite as much astonished as those words would imply, and candor requires me to say that I was more astonished at the form than the substance of the objection. I had thought if gentlemen objected to it at all they would not do so in express words, but would consign my resolution to an untimely grave in the friendly embrace of a committee of investigation.

"Be that as it may, I desired information, and was sincerely seeking it. A friend of mine who sits upon this floor, and who had some opportunities of knowledge, gave to me one of the circulars. He gave it rather in confidence, though not entirely so; rather with the understanding that I should use it for my own information than otherwise. I was enabled to hand back that circular to him within two

days, not having exhibited it to anybody else, and scarcely having had time to read it myself, for as soon as the resolution appeared in the newspapers I received from many cities and from many States, and from many classes of employés of this Government, copies of the circular which had been sent to them. I have in my hand quite a number of copies of it. It is very nicely gotten up, written with care, as nicely as a *billet-doux* between lovers, or a hospitable invitation to dinner."

Mr. Hale, of Maine: "Not extravagantly."

Mr. Pendleton: "I do not know that they are extravagantly gotten up, but that would depend altogether upon the moneys the committee may finally have from the sources on which they have drawn."

Mr. Hale: "Will not the gentleman hold up one of them, so that Senators may see it?"

Mr. Pendleton: "I will hold up one of them, and read it also, for the delectation of my friend from Maine. Here it is in full:"

HEADQUARTERS OF THE  
REPUBLICAN CONGRESSIONAL COMMITTEE, 1892.  
520 THIRTEENTH STREET, NORTHWEST,  
WASHINGTON, D. C., May 15, 1892.

SIR: This committee is organized for the protection of the interests of the Republican party in each of the congressional districts of the Union. In order that it may prepare, print, and circulate suitable documents illustrating the issues which distinguish the Republican party from any other, and may meet all proper expenses incident to the campaign, the committee feels authorized to apply to all citizens whose principles or interests are involved in the struggle. Under the circumstances in which the country finds itself placed, the committee believes that you will esteem it both a privilege and a pleasure to make to its fund a contribution, which it is hoped may not be less than \$—.

The committee is authorized to state that such voluntary contributions from persons employed in the service of the United States will not be objected to in any official quarter.

The labors of the committee will affect the result of the presidential election in 1894, as well as the congressional struggle; and it may therefore reasonably hope to have the sympathy and assistance of all who look with dread upon the possibility of the restoration of the Democratic party to the control of the government.

Please make prompt and favorable response to this letter by bank-check, or draft, or postal money-order, payable to the order of JAY A. HUBBELL, acting treasurer, P. O. box 589, Washington, D. C.

By order of the committee:

D. B. HENDERSON, Secretary.

"As far as I have seen, all of these circulars are in exactly the same language, except that a blank was left in each originally, to be filled by the amount which a certain specified proportion of the salary received would reach. Now, sir, in order that there may be no charge of unfair dealing with this committee and its circular, I have read to the Senate every word

of it, and I ask the Senate to consider it a little in detail.

The committee is organized for the protection of the interests of the Republican party in each of the congressional districts of the Union.

"Party from beginning to end, the country nowhere alluded to—'the interests of the Republican party in each of the congressional districts.'

In order that it may prepare, print, and circulate suitable documents illustrating the issues which distinguish the Republican party from any other, and may meet all proper expenses incident to the campaign, the committee feels authorized—

"Feels authorized!" What necessity is there to have authority to invite gentlemen who desire to make a voluntary contribution to a political fund? What is the necessity for any authority for an invitation of that kind?

"Authorized!" By whom authorized; for what purpose authorized? To apply for contributions to the Republican expense fund! Apply to whom? Apply to 'all those whose interests are involved in this struggle.'

"The committee discriminates very closely between those whose principles lead them to desire the success of the Republican party and those whose interests are involved in the struggle; those whose principles or interests induce them to take an interest in this struggle. Who are they, Mr. President? Who are interested beyond what their principles require in the success of the Republican party in the coming campaign? Certainly the officers; the office-holders; those who enjoy the powers and emoluments of office; those who are in possession of the political power and the moneyed emolument at the disposal of the party. When application is to be made for authority to apply to these officers for a money contribution, who is it that can give the authority to make the application? Manifestly those who have the power of appointment and dismissal; manifestly those who can say to these men whose offices are involved, 'Contribute to the success of this party, or the power of appointment and dismissal is hung over your head.' I submit to gentlemen on this committee that the paraphrase was entirely unnecessary. I submit that the circumlocution was entirely out of place, and that it would have been much more direct and much more pointed and equally delicate to have said, 'We are authorized by those who have the power of appointment and dismissal to say to you whose offices are involved in this struggle that we are authorized to make this application for money to you.'

"The circular starts out with a declaration on its face, which any man who can read at all can read between the lines: We are authorized by those who hold your places in their hands to apply to you office-holders of the Government to make this contribution because your interests are involved in this struggle.

"The circular continues:

Under the circumstances in which the country finds itself placed, the committee believes that you will esteem it both a privilege and a pleasure to make to its fund a contribution.

"A privilege and a pleasure!" Indeed, a blessed privilege! an exquisite pleasure! These officers, forsooth, would never have had the opportunity of enjoying this privilege and pleasure if this committee had not given them the opportunity and the method; the opportunity in the sinking circumstances of the fortunes of the Republican party, and the method by contributions to the committee! Knowing that these office-holders could not have enjoyed this privilege and pleasure except for its invitation; knowing that as soon as they heard of it, they would be ready and willing, nay, eager and anxious, to embrace the opportunity; fearing lest in a moment of enthusiasm and desire, these office-holders might indulge to excess in the enjoyment of the pleasure and privilege; fearing lest on the other hand an ascetic self-denial might restrain them below the bounds of legal moderation, this committee informs them that, in its judgment, it would be about right that clerks having \$900 a year should indulge in this enjoyment to the amount of \$20 worth. Then fearing that might be a damper upon their ardor, the committee express the hope that the contribution shall not be less than the amount suggested by the committee, to wit, \$20.

The committee is authorized to state that such voluntary contribution—

"Voluntary contribution!" Voluntary as the contribution the traveler makes to the pocket of the highwayman when commanded to stop and hold up his hands; voluntary as the contribution which the man of the world makes to the harvest of the Great Reaper when he puts in his scythe—

voluntary contribution from persons employed in the service of the United States will not be objected to in any official quarter.

"Mr. President, is a voluntary contribution objected to anywhere? And does it need any close discrimination as to that passage to see that it means that, while contributions will not be objected to in any official quarter, a refusal to make the contribution will meet with the condemnation of all official quarters?

The labors of the committee will affect the result of the presidential election in 1884, as well as the congressional struggle; and it may therefore reasonably hope to have the sympathy and assistance of all who look with dread upon the possibility of the restoration of the Democratic party to the control of the Government.

"With dread." Who look with dread upon it? What sensible man in this country looks with dread upon it? The people of the country do not look with dread, the material interests of the country do not look with dread, the patriotism of the country does not look with dread, for at the last two presidential elections the people of this country have been almost equally divided in numbers upon the question

as to which party better deserves success. In the presidential election before the last, it is an undisputed fact that a numerical majority of the people of the United States did actually vote to restore the Democratic party to power.

"We appeal to you for sympathy and assistance, and we hope you will make prompt and favorable response to this letter.' How? By expressions of confidence? By telling us the political necessities of your neighborhood? By going forth as an apostle to demonstrate to the people the excellence of the principles of the Republican party? No, sir; none of such sympathy we want. It is your assistance which we hope you will promptly send to us in the shape of 'a bank-check, or draft, or postal money-order,' payable to the treasurer of this committee.

"Now, Mr. President, I will not insult the Senate by undertaking to prove to it that this is no invitation for a voluntary contribution. I will not waste its time by showing that it is a demand for a specific sum of money, levied according to a rule, accompanied by a promise and a threat. 'Your purse or your official life' is the alternative offered; or, to use the language of President Garfield in describing a circular almost identical in terms with this, 'It is a circular sent to the employés of the Government upon the distinct understanding that, if they fail to make return according to the demand, in check or postal money-order, others will be found to take their places who will receive their salaries and pay up the assessment.'

"Mr. President, to whom has the circular been sent? I venture to say here upon this floor, and I speak it upon information which challenges my belief, that this circular has been sent out to every person whose name can be found on any of the rolls of employés of the Government, however remote they may be from the source of power itself. The circular has been sent to the Boston custom-house—seven hundred copies of it—and a demand made for an aggregate of \$15,000. It has been sent to the armory at Springfield, and an assessment of \$18 been made upon each armorer in that institution. It has been sent to the great offices in New York, the post office and the custom-house, and the collector's office, and the various institutions connected with the Government there. These offices have won exceptional credit by reason of their freedom from the debasing arts of political assessments, and yet are to be again plunged into the mire from which they so laboriously have emerged. It has been sent out to employés at Chicago, and assessments made there of the exact sum of \$9.30. How considerably accurate in computation! It has been sent to every postmaster in the country; at least, I have returns from almost every State east of Nevada. It has been sent to the men engaged upon the works on the Ohio River at Marietta, and \$18 has been assessed and demanded of men who

day by day for their daily wages cut stone in making the dam. It has been sent to every employé in the departments at Washington, every clerk, and they have been assessed in various amounts from \$18 to \$50. It has been sent to men who are engaged in daily labor on the Capitol grounds, digging up and beautifying these grounds, and \$6 has been assessed upon each of them. It has been sent to the boys in the Printing-Office, to whom you pay only a dollar per day and furlough them without pay, and \$7 has been demanded from each of them. It has been sent to enlisted men in the army, and an assessment of \$18 made upon men who are paid from the army appropriation bill. Wherever a name can be found upon the pay-roll of the Government for any amount, great or small, this circular has been sent, or is now being sent.

"I said it had been sent to every clerk in all these departments. Why, sir, it has been sent to those unfortunate ladies whom the exigencies of life now compel to support a family off the pittance painfully earned by them, which would scarcely have sufficed to dispense their yearly charity in other days. It has been sent to the women who scrub out the departments in this city, whose poverty is so great that when they leave for their daily work they are obliged to lock up in their close and fetid rooms the infant children who can not be allowed to wander in danger in the streets. It has been sent to the employés of the Senate, and men have been required to pay \$30 in order that they may hold their places.

"Nay, more, Mr. President, it has been sent, at least in the other House, and possibly in this, to the little pages—bright, intelligent, active little fellows, who do the bidding of members there and here. I imagine I can see this grave committee, with this circular in their hands, going to one of these little pages, and urging him by his appreciation of the emergencies of the country, by his appreciation of the excellence of Republican practices, by his dread of the restoration of the Democratic party to power, to make his contribution of \$9 in order to avert such a terrible calamity.

"Mr. President, if this were not a sad scene of political degeneracy and partisan tyranny, it would be in many of its aspects a broad farce.

"I have no fitting words in which to express my apprehension of the degradation and danger of this whole system, of which this is one of the most dangerous outgrowths. It demoralizes and breaks down every man connected with it, those who give and those who take, alike. Among the names on this circular are some of our own cherished associates and members, men of the other House, also, who stand high in the estimation of their party and their country. They are important factors in wielding the political destinies not only of their party but of their country, honorable, upright, excellent gentlemen, to whom we would willingly commit and do commit our honor, and

if necessary would commit our lives, men who could not be forced, even by torture, to go themselves, and with this circular in their hand, to make application to these persons to whom it is sent; men who could not be induced to do it; who would feel it to be a personal dishonor to do it. Yet together they combine, and put in operation this machine, which has no heart to be touched, no body to be punished, no soul to be damned, to visit the houses of the widow and the fatherless, and extract from them, for political partisan purposes, a large proportion of their hard earnings.

"It degrades the men to whom it is sent. What sense of self-respect can be left to the man who feels himself compelled to submit to this extortion, which his honest judgment abhors, and which his penury rejects, and yet is obliged, with a hypocritical smile, to pretend that it is a voluntary contribution? What faithful, honest, personal service in office can a man render when he feels that upon his very best service is put this badge of servitude? How can he admire our institutions with his whole heart as he ought, and devote himself absolutely to the duties of an office, when he is made to buy with money that office which he knows, and everybody knows, is a public trust involving duties to the public? What discipline can there be in a system when all above him, and all below him, are bound together by the consciousness of this common degradation? The galley-slaves are chained together; and their proximity, making them conscious of the common infamy, the common degradation, and the common punishment, leads them to hate, and despise, and dread, and suspect, and injure each other.

"Mr. President, this system is a great wrong to the people. A fair day's work and a fair day's pay is common honesty imported into our Government. If these employes can have extracted and abstracted from their salary 2, or 4, or 10 per cent, and yet sufficient remuneration is left to them, then I say the deduction should be made directly from their salary, and be left in the Treasury.

"Now, Mr. President, how are we met when we make this arraignment of this practice of the party in power? One gentleman who signs himself 'assistant attorney-general,' with a great deal of ostentatious gasconade, says that he defies and spits upon the enactment which is in existence because it is no law, for he has examined carefully the Constitution of the United States, and does not find any clause which authorizes Congress to prohibit voluntary contributions for lawful objects. Why, sir, the man who in the face of that circular can talk about voluntary contributions, is either entirely ignorant of the force of language, or of the substance of things; and in either alternative discussion with him would be useless.

"The gentleman whose name is signed to the circular as the acting treasurer of the com-

mittee, vaunts himself that he has broken no law. Listen to his defense. The law declares:

That all executive officers or employés of the United States not appointed by the President, with the advice and consent of the Senate, are prohibited from requesting, giving to, or receiving from, any other officer or employé of the Government any money or property, or other thing of value, for political purposes.

"He says, 'I have committed no crime, I have not violated the law, because I am not an officer or employé of the Government.' Putting himself upon a decision made in the last century, that a Senator of the United States was not liable to impeachment, he says: 'I am not liable to this law, because I am a member of Congress, and not an officer or employé of the Government. If I were a door-keeper, or a clerk, or a messenger, I would be liable under the statute. As a member of the House of Representatives I am not.'

"Mr. President, that question is to be taken into the courts. I will not anticipate their decision. I say to the gentleman who signs this circular that before he gets through he will find if he has not landed some of these men in the penitentiary he has drawn them perilously near to the verge of a criminal conviction."

Mr. Hale: "Mr. President, I do not mean to take up too much time in replying to the Senator from Ohio (Mr. Pendleton), but there are some things which he has said, there are some impressions that he has conveyed, no doubt honestly, to the Senate and to the public mind upon which I wish to touch. In the first place, I desire to say that as to the circular which has been paraded here, signed by the Secretary of the Republican Congressional Committee, with the names of the executive committee at the head, my own included, I have no apology to make.

"It is almost exactly like those that were sent out in 1880 and in 1878, when I had the honor to be chairman of the committee, and, as the Senator from Iowa (Mr. Allison) said, those two were submitted to and approved by the then 'civil-service reform' President, Hayes.

"There has been no intention on the part of the committee in sending out this little circular, three inches by eight, as shown by inspection, of oppressing anybody; and it has not been sent out in the dark. There has been no secrecy, nothing whatever covert, nothing whatever apologetic, on the part of the Republican Congressional Committee in this act signed by Colonel Henderson, its secretary. If, in sending out numerous circulars asking employes of the Government if they were willing to contribute to a cause which they believe to be the greatest, politically, that agitates men's thoughts in this country, there has been here and there a circular delivered to some poor woman in a department, or outside, of Washington, that has never been intended. The

whole scope and aim of political contributions as engineered by congressional committees, whether on the one side or the other, have never been a mystery, and there is no more mystery about it to-day than there ever was before. No woman has ever been requested except where under her initials she has appeared as a man, nor has any poor day-laborer been intended to be even solicited. If there has been any such poor laborer that has received any invitation of this kind, he may be assured that he will never be troubled again by the Republican Congressional Committee, whether he pays or not.

"But the committee, without any pretense, and without any sentimentalism, finds itself, as the organ of the Republican party, confronted with a most important campaign. The congressional elections, upon which depends the fate of the next House of Representatives, are now impending, and so long as men believe that one thing is right in politics and another thing is wrong, so long as men believe that the party with which the Senator from Ohio is identified, and of which he is a distinguished leader, is bent upon mischief to the country, and so long as they believe that in the Republican party and in its future ascendancy is bound up the good of the country, neither you, sir, nor the Senator from Ohio, nor I, will ever find a day when men will not be willing to put in time and effort and energy and part of the means that have been given to them to maintain the right and keep down the wrong. I want to say to the Senator from Ohio that with all of the pity that he has arrayed for the poor woman whom the Republican committee has not sent to, for the laborer in his shop whom the Republican committee does not seek, for the orphan that he says is besieged, but is not, and notwithstanding all that he has said about this being compulsory, I can tell him from the Republican Congressional Committee that the constituency to which these invitations have been sent has been found a willing constituency.

"In the last days of the last Democratic administration that ever was, and, putting my word against that of the Senator from Ohio, I should be tempted to say that ever will be, in the last days of the Democratic administration under Mr. Buchanan, not only were the clerks in the departments found followed up under a belief and a threat of removal to the paying of involuntary contributions, but they were hounded from room to room by superior officials, the heads of the bureaus and of the departments standing over them; and the President of the United States, the leader of his party, a veteran in political strife and political organization, was found consulting with the instruments through which this was done from day to day and week to week, including Sundays, for the purpose of making this great haul more exhaustive, so that no man should escape from its meshes. Yet to-day the Senator from

Ohio stands up in his place and declares the former purity and glory of the Democratic party, and defies the Republican party to point out in its history anything touching what he calls the degradation of civil service by reason of contributions."

Mr. Van Wyck, of Nebraska: "Mr. President, I agree with much that the Senator from Maine (Mr. Hale) has said, particularly where he proved so conclusively that the Democratic party is responsible for the abuse which has crept into and is being exercised by the Republican party to-day. That part of his address may be very well as a reply to the Senator from Ohio (Mr. Pendleton), but certainly I desire some better warrant for my action than the record of the Democratic party. Has the Senator forgotten that in the evidence which he read the charges were made against that organization in the decay of its existence? Has he forgotten that those facts were the terrible arraignment aimed against it, and when they were brought into the grand assize of this republic and tried upon those charges they were found guilty and driven from power? Does the Senator desire that the parallel shall be complete?"

"Mr. President, it seems surprising that no better authority can be adduced than that to which the Senator alludes, that this system was exercised to a greater extent, if you please, in the days of the Democracy than now. That is certainly no justification for a weaker exercise of the power.

"The Senator says that the clerk and employé was followed even to the receipt of his money from the Government, and it was paid directly from the Treasury for the benefit of the Democratic party. I ask my friend if we do not go nearly as far to-day?"

"He further states that the assessment is voluntary, and the circulars are sent to prominent citizens throughout the country. I ask the Senator from Maine or the Senator from Iowa if in the circular sent to private citizens any amount is designated? Why is the distinction made when the circular is sent to an employé, and the committee say they hope his contribution will not be less than a certain sum? Is that inserted in the circular which is sent to men of wealth, who are supposed to feel a great interest in the legislation of the country? When the circular is sent to the eleven Bessemer-steel manufacturers in the United States, are they asked to give two per cent upon their income? Will the Senator from Iowa explain?"

Mr. Allison, of Iowa: "Now, my friend wants to know if we assess two per cent upon the profits of Bessemer steel? I do not know what the circular contains in that regard, or whether we have issued a circular to the Bessemer-steel men, or have written them letters; but I should say, for one, that the Bessemer-steel people ought to contribute pretty liberally to such a fund."

Mr. Van Wyck: "The Senator from Iowa has not exactly answered the question, but the point is, the circulars which go to the employes of the Government designate how much they are expected to pay. Am I right in that?"

Mr. Allison: "I think that is true in part, and in part not true."

Mr. Van Wyck: "Precisely. It has been said that the circulars are sent to those out of Government employ as well as those in the employ of the Government. Then I want to know why a distinction is made between the circulars sent to employes of the Government and those sent to private citizens, if it is purely voluntary. Will the Senator explain that?"

Mr. Allison: "Am I to be catechised now by the Senator from Nebraska? If we sent a circular, for example, to a rich man like the Senator from Ohio—our circulars, of course, do not go to him—but if we sent circulars to leading Republicans in the country, I do not suppose that we should fix a sum. If we send circulars, however, to men who are in public employment, the circular names a minimum sum, as was stated by the Senator from Maine. The Senator from Nebraska asks me why that is done. It is done simply because we only expect to receive a small sum. Did the Senator from Nebraska hear me when I stated in his presence, or in the presence of the Senate, that in the last campaign of all the employes less than one tenth have contributed one dollar? I ask him to name a man in public employment who has ever been disturbed in the slightest degree because he did not contribute to a campaign fund?"

Mr. Van Wyck: "I agree with my friend, but I am endeavoring to see how far this matter is voluntary. That is what I was proceeding to find out."

"I think I shall be excused for saying this much or a little more on this line. I think I have a right to say that it is not prudent for the Republican party to adopt that policy which largely contributed to the destruction of the Democracy. I claim the right to occupy that ground as a Republican to-day. I choose as a Republican here, differing with my associates, to take warning from the past. If the party of the gentlemen on the other side has gone to decay, and that too by the voice of the American people, I think it behooves the organization with which I am connected to at least take warning from the lights, the false lights, if you please, which brought them to ruin and destruction. I desire to be excused from any such fatality, or at least from the toleration of any such evil."

Mr. Hale: "I said that no reasonable man if he examines faithfully and fairly into the matter will object to it; that it is purely and essentially voluntary; that no man, woman, or child is harmed, or has been or will be, if he or she declines to pay. I said that the Senator from Ohio had challenged me to show in regard to the Democratic party any course

tending to what he called the degradation of political assessments; and, not as an excuse, for I do not ask for any excuse for the Republican committee—I stated in terms that it was not to excuse it, but to show that the Democratic party of the olden time did a thousand-fold worse—I pointed out the fact that they ran in paths where we would not pretend to penetrate. I quoted the examples that I cited from the "Record," and I did it for that purpose. I say to the Senator from Nebraska, and not as an excuse for what we are doing now, for I ask no excuse—"

Mr. Van Wyck: "The Senator read the extracts to condemn the practice of the Democratic party."

Mr. Hale: "Certainly I did, and I do condemn that method."

Mr. Van Wyck: "That is just what I mean."

Mr. Hale: "Those were different methods from ours."

Mr. Van Wyck: "The only difference was that the Democratic party was bolder than we are. They always have been in such things. They went further than your circular says, but you were more shrewd than they, probably. Either the Senator from Maine or the Senator from Iowa said that they were careful of what they did; that they were prudent; that they had eminent counsel to examine this question to see how near they could go to the felon line. They wanted to see just how far they could go and be safe in this matter; that was all. I do not want to force my Republican brethren, only I beg to be excused from following the methods which the Democratic party pursued. It was a thorny road for them, and I propose not to wear that kind of stones in my shoes."

"At the commencement of this session we had thousands upon thousands of petitions praying us to regulate interstate commerce. Those petitions were referred to the appropriate committee, and there they have slumbered. Just a little healthy legislation in that direction would have helped the Republican party more than the few thousand dollars which we collect in that way."

This debate was terminated by adjournment, and not resumed.

**PROPOSAL TO PLACE GENERAL GRANT ON THE RETIRED LIST.**—In the Senate, on December 5th, a bill was introduced to place General Ulysses S. Grant on the retired list of the army, with the rank and grade of general, and pay accordingly.

Mr. Vest, of Missouri: "Mr. President, this bill is an innovation upon the established practice and principles of the Government in regard to the retired list of the army. This bill is utterly without precedent in the legislation of Congress. It takes General Grant from civil life, after he had voluntarily left the military service, and places him upon the retired list in utter disregard of the requirements and provisions of existing law."

"In the debate upon this bill in the Forty-sixth Congress, the Senator from Illinois was pleased to ascribe the opposition to this measure to partisan prejudice, and he exhorted Senators on this side of the chamber to lay aside all political feeling and approach this bill in a broad and catholic spirit of nationality, as giving credit to a great soldier.

"Mr. President, I desire to place before the Senate an act of magnanimity performed by the Republican party, which not only 'broke the column of this mighty nation's array in the presence of future generations,' but in the presence of this generation added another name to the long list of those who have fallen victims to 'party prejudice.'

"In the Forty-fifth Congress a bill was passed, only six votes dissenting, authorizing the President to place upon the retired list my predecessor upon this floor, General James Shields, of Missouri. That bill came to a Republican Senate. Broken in body and in fortune, maimed by shot and shell, with the snows of seventy winters upon his head, this gallant Irishman came to the Congress of his adopted country, and begged for the pittance which would give comfort to his declining years. Bulwer, with matchless pen and pathos, has drawn the picture of a wounded veteran about to pledge for a crust of bread his cross of the Legion of Honor, given him upon the battlefield by the Emperor himself; but this picture of fiction grows faint and colorless when I state that the gallant old soldier who came for relief to the Forty-fifth Congress had been forced by actual want to pawn the swords presented to him by grateful States for gallantry and heroism. It would seem, Mr. President, that a case like that would exorcise even the fiend of party; but let the record show.

"The bill placing General Shields upon the retired list passed the House with only six votes opposing, and was taken up in the Republican Senate. By a party vote, only one Democratic Senator voting in the affirmative, the bill now pending, placing General Grant on the retired list, was added as an amendment.

"The Senator from Vermont (Mr. Edmunds), who I am sorry to see is not now in the chamber, after having voted for the amendment, proceeded, in a speech remarkable for its clearness and emphasis, to give the reasons why he should vote against the bill as amended.

"I need only add that after this presentation of the subject, followed by the Senator from Illinois, now presiding officer of the Senate, in the same line of thought, the bill placing General Shields and General Grant upon the retired list was defeated by a vote of thirty to thirty-four in a Republican Senate.

"Mr. President, if the arguments made in the Forty-fifth Congress were sufficient to defeat the bill giving to an aged veteran a bare support for himself and family out of the vast wealth which his sword had helped to win for his adopted country upon the plains of Mexico,

how much more conclusive must be the same arguments against the bill now pending!

"General Grant is not now within the requirements of the law, nor does he ask or need the proposed legislation. He is in robust health, in the prime of life, and beyond pecuniary want. The first American soldier to receive the rank of general, he was the first American citizen to seek for a third term, the highest office within the gift of the republic. During his second term as President, the salary of that office was doubled for his benefit; and he is to-day surrounded by wealthy connections, living luxuriously in the city of New York, and possessed, besides other fortune, of the income from \$250,000 donated to him by the public. To give General Grant the full measure of glory as a great soldier is one thing; to tax the people of this country \$13,500 annually in order to enrich a man already in affluence is a different proposition.

"To Grant the soldier this country, forever united, will be forever grateful; to Grant the politician it owes nothing. Not the American people, but General Grant and his political followers, marred the symmetry of his colossal figure as it stood before the world at Appomattox. To the pages of history emblazoned with military achievements unequalled in modern times has been added another page unequalled in the annals of modern corruption.

"Sir, it is not for me to paint the picture. It has been done by a master-hand, and in colors which will never fade. The junior Senator from Massachusetts (Mr. Hoar), chairman of the Chicago Convention, is the artist, and if I again point to the canvas upon which in the Belknap trial he placed the somber portraiture of Grant's second term as President, it is not because the contemplation is pleasant to any American. Said the Senator from Massachusetts (Mr. Hoar) then:

"My own public life has been a very brief and insignificant one, extending little beyond the duration of a single term of senatorial office. But in that brief period I have seen five judges of a high court of the United States driven from office by threats of impeachment for corruption or maladministration. I have heard the taunt, from friendliest lips, that when the United States presented herself in the East to take part with the civilized world in generous competition in the arts of life, the only products of her institutions in which she surpassed all others beyond question was her corruption. I have seen in the State in the Union foremost in power and wealth, four judges of her courts impeached for corruption, and the political administration of her chief city become a disgrace and a by-word throughout the world. I have seen the chairman of the Committee on Military Affairs in the House, now a distinguished member of this court, rise in his place and demand the expulsion of four of his associates for making sale of their official privilege of selecting the youths to be educated at our great military school. When the greatest railroad of the world, binding together the continent and uniting the two great seas which wash our shores, was finished, I have seen our national triumph and exultation turned to bitterness and shame by the unanimous reports of three committees of Congress—two of the House and one here—that every step of that enterprise had been taken in fraud. I have heard in

highest places the shameless doctrine avowed by men grown old in public office that the true way by which power should be gained in the republic is to bribe the people with the offices created for their service, and the true end for which it should be used when gained is the promotion of selfish ambition and the gratification of personal revenge. I have heard that suspicion haunts the footsteps of the trusted companions of the President."

"Sir, it is not my picture; it is drawn by another hand, and it will live as long as the English language is spoken or written.

"Mr. President, I presume it has been determined that this bill shall pass the Senate. It is not my hope or expectation to defeat it, but I could do no less than place upon record the reasons why I shall vote against a measure which in my judgment is without a single claim upon the justice or generosity of the American people."

Mr. Logan, of Illinois: "Mr. President, the Senator from Missouri always speaks well on any subject, but, like other men, he sometimes falls into errors. I will try to answer his propositions one at a time if I can. His first proposition is that there is no precedent for this bill, as I understood him. That is a most astounding statement to me, and certainly it ought to be to the Senate. This proposition is to take a man who is now a civilian and authorize the President of the United States to appoint him to the army with a view of putting him on the retired list. That is the proposition, and the Senator from Missouri says there is no precedent for any such thing. Why, sir, on your calendar now are bills of that character. There has not been a Congress since 1866 that has not passed bills authorizing the President to nominate men to the army who had become civilians either by resignation or otherwise from the army; and there has not been a President since the war down to the present time who has not by virtue of bills that have passed Congress nominated civilians to the army, and they have been confirmed by the Senate.

"The next proposition he makes is that inasmuch as General Shields, who was his predecessor on this floor, was not placed back in the army as he requested to be, being old and feeble and poor, therefore no other man ought to be. I will say to the Senator that the refusal to place General Shields back in the army did not prevent the Senate of the United States from placing Colonel Lee and Colonel Haller back in the army, who had been out longer than General Shields. So there is nothing in that. I call the Senator's attention to the fact that when the bill for General Shields was before the Senate of the United States, asking that he might be put back in the army, so that he might be placed on the retired list, although I was not a member of the Senate at that time, I wrote a letter and published it in the public prints to the very Senator who made the motion the Senator spoke of to amend the bill which defeated the bill.

That letter was published all over this country, defending General Shields, and insisting that in right and justice the bill for his benefit ought to pass.

"So the Senator can not lay it at my door that that bill was not passed, and General Shields was not put in the army, because I was one of his friends and one of his advocates, publicly, although I had not a vote on this floor at the time. I gave the law in that letter, and I gave the reasons for it, not so ably perhaps as the Senator from Missouri would have done, but as ably as my feeble ability would allow.

"Then, sir, another proposition the Senator states is that this bill is presented for the reason that General Grant was defeated at Chicago, and because of that certain of his friends desire to remunerate him. Why, I am only surprised, as I go along examining the speech of the Senator, at his want of recollection. Does the Senator—and I call his attention specially to this—pretend to say, and shall it go broadcast to the country, that this bill was only introduced after General Grant was defeated at Chicago? Is that his statement? He is woefully at fault in that. Senator Blaine introduced in Congress, long before Chicago was ever named as the place for the last Republican Convention to be held, a bill putting General Grant on the retired list. The proposition had been made in the Senate and in the House long before General Grant was ever mentioned as a candidate before the Chicago Convention. So the Senator's beautiful picture of untying the money-bags and remunerating the fallen fortunes of a candidate for the presidency goes for naught when you come to the facts.

"Why, sir, shall the Congress of the United States, the people of this country, refuse to give the President authority to renominate General Grant to the army for the purpose of putting him on the retired list? For what? Merely as an acknowledgment by the whole country that the people were, and that the people yet are, willing to show their gratitude to the one man who, above all others, did more in the army to save his country than any other man. Some say, 'Why let us retire ex-Presidents?' When you retire ex-Presidents and put them on the retired list you do that because they have been Presidents of the United States. That is not the retirement that I desire to see given to General Grant. I desire to see him retired on account of his military services, and not for any services as a civilian; and that is what is proposed by this bill."

Mr. Butler, of South Carolina: "I do not like to interrupt the Senator from Illinois, but I do not wish to be put in the position of voting against this bill because of prejudice. No such motive as that actuates me. I have not one particle of prejudice against General Grant. There is scarcely an honor this country could

give him that I would not be quite willing to bestow on him. The ground on which I shall vote against the bill is this, if the Senator desires to know: I have always understood that the retired list of the army was intended for disabled soldiers, for officers who had served their time out in the service of the country, and were put there because they were unable to discharge the duties of the military service. I have heard no pretense—if the Senator has alleged it, it has escaped me—that General Grant in the first place desires retirement; I say in the second place that he does not need it pecuniarily; and in the third place it can certainly confer no honor upon him.

"I oppose the bill, and shall vote against it purely on those grounds, not for the reason that I am not quite willing to recognize all the services General Grant has done his country. It is not that I am not quite willing to confer upon him any honor on earth that we can give him. If the Senator from Illinois will state that General Grant needs \$100,000 or \$500,000 to prevent his suffering, I will vote for it to-morrow; but simply to vote to put him on the retired list of the army is certainly no additional honor, and it puts him, in my judgment, in the attitude of a beggar before the country, when he is not in necessitous circumstances."

Mr. Logan: "Mr. President, the friends of General Grant, I hope, will be permitted to be the judges on that for themselves. Gentlemen who are all the time afraid that General Grant will be humiliated are so tender of him that they do not want to humiliate him, and hence they criticise his friends. But I say, as a friend of General Grant, that General Grant would consider it an honor to be put on the retired list, and I should consider it an honor to put any soldier on the retired list after he has passed through such services as Grant has, to show that the country still recognizes his services; and there is where the honor of the thing is. It is not the amount of money involved, but it is the fact that the country recognizes that he did great service for it."

The President *pro tempore*: "The Senator from Delaware now moves an amendment to strike out all after the enacting clause and insert what will be read."

The acting Secretary read the words proposed to be inserted, as follows:

That hereafter there shall be paid to every President of the United States who shall have served or may hereafter serve in said office, and who shall have retired from the same, a sum annually during his life equal to one quarter part of the annual salary paid him while in said office: *Provided, however*, That said sum shall not be paid to any President while holding said office by any re-election thereto.

Mr. Bayard, of Delaware: "Mr. President, this bill upon its face presents that which it would seem ungracious for any American to oppose. It seems to me, now, that there is no need for additional recognition of the eminent military services of General Grant. They are

already recognized, not denied, but everywhere accepted, approved by the American people. Still I am not disposed to interpose objections to further demonstrations of respect, honorable to their recipient, entirely so to those who offer them; but this is a law-making body. This bill proposes in its terms to suspend, 'for this purpose *only*,' a general law of the United States. Now, what is that law? As early as 1861 the policy was adopted of allowing officers of the army who had served well and faithfully for a long time, who had been disabled by wounds or disease from active service, to be provided with an honorable and fairly remunerative retirement. It was a wise, beneficent act. It has been followed by amendments. It was intended for a class of military officers, and for that class only—officers in the Army of the United States, and none others. By section 1,258 of the Revised Statutes, the number of these beneficiaries honorably to be retired is limited to three hundred. I understand that, since the enactment of that law, another hundred has been added to the list by some amendment to an appropriation bill, which has not as yet found its way into the reprint of the Revised Statutes. So that there is now a maximum of four hundred officers of the army who may be upon this list, although by the terms of the law 'any less number to be allowed thereon may be fixed by the President at his discretion.'

"This general law for the retirement of officers who have seen long service or have been disabled, not only is a relief to them, but it is a relief for their juniors in rank and service, who in a time of profound peace have but two avenues by which they are to escape from a prolonged and painful retention in their former rank. The death of a superior officer will create a vacancy; the placing of a superior officer upon the retired list will create a vacancy, for section 1,257 provides:

When any officer in the line of promotion is retired from active service, the next officer in rank shall be promoted to his place, according to the established rules of the service; and the same rule of promotion shall be applied, successively, to the vacancies consequent upon such retirement.

"Therefore two benefits are accomplished by placing an officer upon the retired list. He enjoys the repose that long and faithful service has won for him; and his junior in rank has a way opened to his legal and regular advancement 'according to the established rules of the service.' Now it is proposed, by an instance of especial personal favor, to invade those rules, to place in the way of just promotion one more obstacle taken from civil life for this purpose. As I said before—"

Mr. Logan: "Will the Senator allow me?"

Mr. Bayard: "Pardon me. Let me state my own case, and then I will hear my friend with great pleasure."

Mr. Logan: "I do not want to discuss it at all."

Mr. Bayard: "I am taking the text of the law and discussing it. I do not propose to argue this case upon the question of personal merit. I would be second to none in a fair and generous acknowledgment of all that is due to the eminent individual named in this bill. He needs from me no praise. He has it to-day in abundance unquestioned, and, I doubt not, thoroughly deserved. But I do deny the justice or the wise policy of invading the well-established rules of the service, and bringing from civil life any individual, however distinguished, at the cost of many other members of the military service, who, in obscurity from the public observation but not the less in faithful and dutiful endeavor of their duty, are performing and have performed well and steadily their duty during all the time the proposed recipient of this special favor has been enjoying other honors and profits, and the ease and emoluments of civil life, and leisurely and luxurious amusement."

Mr. Brown, of Georgia: "It has been the usage of all great nations which have had great wars to render distinguished honors to the heroes of those wars. The judgment of mankind has approved it. Whether you call it hero-worship or whatever you may call it, the people of all civilized nations and of all savage nations do it. I do not profess to be entirely free from that principle which is sometimes called hero-worship. I do admire and entertain the very highest respect for the man who has shown himself a hero in war, because he exhibits high qualities that are worthy to be admired."

"If we Confederates had succeeded in the late civil war and it had been my fortune to-day to have stood in a Confederate Congress, that government having been established, and if the question had come before that Congress whether we should place Robert E. Lee or Joseph E. Johnston upon the retired list, had they occupied just the position that General Grant occupies to-day, I should not have hesitated one moment to vote that distinction to either with the attendant emoluments. Why? Because they were grand leaders; they were brave and magnanimous; they were powerful on the field; they were heroes, and because I should have held that they had rendered distinguished services to their country. In that case the bounds of the Confederacy would have been the boundary of my country, and they would have been the heroes of my country. The Confederates failed, however, and instead of the supposed case, I stand to-day as one of the representatives of a State in this Union in the Congress of the United States, and we having failed, and the Union having been restored, and we having returned to our allegiance to that Union, as I stand to-day, the heroes on the Union side become the heroes of my country, and it is my duty here to vote the same tribute and the same honor to them that I would have voted, in the case supposed, to Lee

or Johnston, had the Confederacy been established."

"Therefore, I shall vote in this case for the pending measure. Last year I voted against a resolution to place General Grant upon the army roll because, as I understood it then, it was very doubtful, if the measure had passed, whether he might not have been assigned to active duty, and whether there might not have arisen conflicts between him and the present General of the Army as to who should hold that position. General Grant having retired and gone into politics for the time, and having been honored by the people of the United States with two elections to the presidency, I would not vote to place him back upon the army list where he could return to active command and interfere with the present General of the Army; I think it would be unjust to do it. But this proposition comes distinctly before us in the shape of placing him on the retired list. In other words, it is asked by his friends that we do him the honor to put him back on the list of the army, where he so much distinguished himself and where he rendered such important service, and retire him with the common honors and the common pay that an officer of his rank thus retired receives. That meets my cordial assent. I believe it is proper to do it."

Mr. Call, of Florida: "Mr. President, this bill proposes an acknowledgment for distinguished public services rendered by an eminent citizen. The only two questions that are legitimate to the consideration of the bill are as to the character of the services and as to the form in which the public acknowledgment shall be made. Ordinarily these two divisions would comprehend the entire consideration of the subject, but there are circumstances outside of the subject of the bill which relate to the Senate as it is now constituted, which will influence my action, and which, I think, may very properly influence the action of other Senators here."

"We are here in part Senators from the States formerly engaged in resistance to the national authority, and in the larger part Senators from the States that maintained the national authority. The bill proposes a recognition of the military services of the leader of the armies that sustained the national authority, and it is proposed in this body by the Senators from those States that adhered to that authority. It is submitted to us, now restored to our constitutional relations to the Union, whether we shall say that they who maintained the authority of the Union shall now bestow upon the distinguished general of their armies such public reward and such recognition as to them and their people shall seem meet and proper."

"Sir, I maintain that, if there is no constitutional objection to the measure, if there is no important ground of public policy to require it, it would be ungracious, as well as unwise, in us to sit in disapproval and rebuke

upon the judgment of the people of the North as to the form, or the manner, or the extent in which they shall make that public recognition of the services of the leader of their armies. For that reason I shall not allow my judgment to be put in opposition to theirs; nor can I, upon an investigation of the subject, find any ground of constitutional objection or of public policy that would justify me in doing so. The whole extent of the question is, Shall a public acknowledgment by the Congress of the United States be made of military services which by the general verdict of the American people have been recognized as pre-eminent? Upon that question there can be no great difference of opinion. I shall vote for the bill, sir, and vote for it with pleasure."

Mr. Jonas, of Louisiana: "Mr. President, I have been sick and absent from my seat for several days, and had no intention of taking part in this debate. As it seems, however, that we will be called upon in a few moments to vote, I desire briefly to give the reasons why I can not vote for this bill, or for the amendment offered by the Senator from Delaware.

"While Senators from the South have been airing their Confederate reminiscences, and acknowledging their patriotic adhesion to this Government, which again and again they have adhered to, and to which they have again and again vowed allegiance, while they are making their new protestations, they seem to have forgotten the fact that sixteen years have passed since the war ended. They seem to have forgotten that there are no longer any sectional distinctions or divisions in this country. They seem, some of them, to have forgotten that they sit on this floor not as Southern Senators, or ex-Confederates, but as American Senators representing States in the Union.

"I was astonished a few moments ago to see my esteemed friend from Florida (Mr. Call) arise and to hear him, in the character of an ex-Confederate, say that he sat here for the purpose of doing that which the Senators of the North and the people of the North desire to have done. I acknowledge no such obligations and I acknowledge no such distinctions. This is an American Senate, and I represent in part one State of this Union, as the Senators from Northern States represent their States and their constituents, and I will be guided in the votes which I cast by my idea of my duty to my whole people instead of what I think it becomes me to do as an ex-sinner and ex-Confederate in order to atone for that sin which I committed twenty years ago by offering here in my place to execute the edict of the Northern members of this body, or what is supposed to be the will and pleasure of the Northern people. I do not think that this is the proper way in which this measure should be considered.

"I am not opposed to this bill simply because of its unusual character. I am not opposed to the bill simply because it proposes to

put a civilian on the retired list of the army. I am still less opposed to it because I would in the slightest degree detract from the great fame, the great renown, which has been conferred upon General Grant not only by the people of this country but by the people of the world, who have proclaimed him to be one of the greatest and most successful military commanders of modern days.

"I was an humble soldier in the Confederate army; but I have never revamped my recollections of secession, rebellion, and war, and brought them upon this floor. I have never alluded in words of criticism to anything which occurred during the war. I have said nothing and have nothing to say in condemnation of any military act committed during the war. I have stood ready here to give all honors, and all praise, and all glories to the heroes of the war. I have stood here ready to yield to no man in my devotion to the interests of the soldiers who fought against me. I have been willing to vote for their pensions; I have been willing to vote for their promotions; I have been willing to accede to all honors and to all glories which a grateful people, rightly in my opinion, have been disposed to shower upon them.

"But the proposed beneficiary of this bill, at a time when the people had placed him at the head of the army, when they had created the highest military office in the land for him to fill, when they had placed him in a position full of honor and full of emolument, which he could have occupied to his last days with the approbation and unanimous approval of the whole people of the country, North and South, thought fit to abdicate that position, and to enter upon the career of a civilian and a politician. Elected by his people to the highest office in the Government, honored equally with the Father of his Country, and equally with any of the best and greatest in our country's history, he retired from that position only because the people were faithful to their traditions, and considered that his measure of civic honor had been filled. I have not heard that he has lost fortune. If so, I stand here ready to assist in voting him a pension, in voting him money, in voting him anything which will aid in paying the debt which the nation owes him as a successful commander of her army, and probably as such her savior in her hour of peril. When, however, he comes here as a civilian, and when we are asked to place him upon the retired list of the army as a reward, not for his military services, because we rewarded them to our uttermost at the time he was a soldier, but to reward him as a civilian, I stand here as the representative of a people who have the right to challenge his acts as a civilian, and to ask in what he has earned their gratitude and in what he is entitled to their praise or further honor.

"Mr. President, I can not vote for General Grant, because as President in 1873, and in

1875, he subverted and destroyed the liberties of the people whom I represent upon this floor. I can not vote for General Grant, because when he was President in 1873 and the people of Louisiana were being deprived of their constitutional rights and privileges, and a government foreign to them and not elected by them was being installed over them by his order and by military force, they sent on to him a committee of two hundred of their best citizens, not politicians but citizens and tax-payers, men possessing an interest in the State as the representatives of property, and they telegraphed to him:

Please do not take any final action in the recognition of this government until we shall have a chance to lay our case before you—

"He responded to them through his Attorney-General:

It is useless for you to send two hundred thousand of your best citizens; they can not be heard; the case is adjudged; the Pinchback government is acknowledged, and it will be maintained.

"Am I to vote civic honors, am I to vote military honors, to the man who thus set his foot upon the liberties of my State, and was deaf to the appeal of her people to be heard?"

"Again, in 1875, when the Legislature of the State of Louisiana was assembled and organized, a belted officer, followed by his bayonets, entered the legislative chamber of the State and unseated the Speaker whom the members had elected, and dissolved that Legislature, which had organized, and this was done by the order and command of General Grant, President of the nation, and as such, acting Commander-in-Chief of the Army. Did this entitle him to the regard and support of my people; and for this shall he be rewarded?"

"No, Mr. President; for what he did in war, all honor; no one will accord it to him more cheerfully than I; but not for what he did in peace as a civilian (and I consider the bill before us now to confer reward as a civilian, he steps upon this ground as a civilian, he is to be crowned as a civilian, and as such he is to be promoted), I for one shall never consent by my vote to reward or approve such victories as he gained in Louisiana over republican institutions and the liberty of the people."

The question was taken on the amendment and it was rejected.

The bill was ordered to be engrossed for a third reading.

The bill was read the third time.

The President *pro tempore*: "The question is, Shall the bill pass?"

The roll-call having been concluded, the result was announced as follows:

YEAS—Allison, Anthony, Blair, Brown, Call, Cameron of Pennsylvania, Cameron of Wisconsin, Conger, Davis of Illinois, Davis of West Virginia, Dawes, Ferry, Frye, Harrison, Hawley, Hill of Colorado, Hoar, Ingalls, Jones of Florida, Jones of Nevada, Lapham, Logan, McDill, McMillan, Miller of California, Mitchell, Morrill, Platt, Ransom, Rollins, Saunders, Sawyer, Sherman, Teller, Windom—35.

NAYS—Bayard, Butler, Cockrell, Coke, Farley, Groome, Grover, Hampton, Harris, Jackson, Jonas, Maxey, Pendleton, Pugh, Slater, Vest, Walker—17.

ABSENT—Aldrich, Beck, Camden, Edmunds, Fair, Garland, George, Gorman, Hale, Hill of Georgia, Johnston, Kellogg, Lamar, McPherson, Mahone, Miller of New York, Morgan, Plumb, Saulsbury, Sewell, Vance, Van Wyck, Voorhees, Williams—24.

So the bill was passed.

In the House, on July 31st, the bill was referred to the Committee on Military Affairs.

CHINESE IMMIGRATION.—In the Senate, on March 1st, the bill to enforce treaty stipulations relating to the Chinese was taken up. A substitute was proposed and considered. Its important point was the limitation of Chinese immigration.

The Presiding Officer (Mr. Hoar in the chair): "The question is on the amendment of the Senator from Kansas (Mr. Ingalls) to the substitute reported by the Committee on Foreign Relations. Is the Senate ready for the question? The Chief Clerk will report the pending amendment."

The Acting Secretary: "In section 1, line 4, before the word 'years' it is proposed to strike out 'twenty' and insert 'ten,' so as to read '":

That from and after the expiration of sixty days next after the passage of this act, and until the expiration of ten years next after the passage of this act, the coming of Chinese laborers to the United States be, and the same is hereby, suspended.

The roll-call having been concluded, the result was announced: yeas 23, nays 23.

So the amendment to the amendment was rejected.

Mr. Hoar, of Massachusetts: "Mr. President, I do not wish to prolong this debate or to restate the argument which has, to my own satisfaction, demonstrated the enormity of the legislation which is proposed. The vote which has just been taken shows that it is the purpose of those having this bill in charge to force it through without regard to its effect upon the public faith of this Government, just pledged, by an act in which the Senate itself took its constitutional share, to the Empire of China.

"Such is the purpose of the framers of this bill, we having promised that we would not prohibit, but would only reasonably suspend the immigration of Chinese laborers to this continent, that promise having been accompanied with an express assurance given to China, reported to us by our envoys, that it was the purpose of this Government to use this power to adjust the balance of this class of labor in different parts of the country. When China asked for a more specific definition of this right of suspension, our commissioners said to China, 'You may trust in the justice and good faith of the Government of the United States.'

"In the face of that treaty and in the face of that contemporaneous promise reported to us before the treaty was ratified by the Senate,

it is now the purpose of a majority of this body to proceed to prohibit, not to suspend, but to proceed to do the one thing which we promised we would not do, and which our commissioners assured China might be left to the justice and good faith of the people of the United States."

Mr. Edmunds, of Vermont: "The bill does not provide that the subjects of the Emperor of China who are now in the United States lawfully shall go away; it does not provide that any person who is within our borders shall do or suffer anything whatever; but it simply provides, with the consent of the Government of China (which has a right to be a government of some kind or other, I suppose), that a certain class of the subjects of that empire shall not come into our community for a certain period of years.

"That is the proposition; and like every other such proposition, whether you go into the moral law about crimes or not, it is a question that depends upon the just judgment (and that every man must judge about for himself), the policy of the community, the State, or the nation. It has always been so; it always must be so until every government is broken down, as the Nihilists propose to break down the Government of Russia—and I wish it were broken down as it is now organized, not by such wicked means, but by such just means as our forefathers broke down the government of the King of Great Britain in this country—but it must depend always upon what the people organized into a community think it is fit to do.

"My learned friend says that that is not a sound proposition. He says that homogeneity is not, according to the historic experience of civilized peoples, necessary to the success of a republic, and he says that the Greek republics did not have a homogeneous population. So they did not; and where are the Greek republics now? How long did they last, and what caused their fall? Exactly that thing, that they did not possess that quality in most of the instances of the Greek republics, and away they went.

"My honorable friend says that the Swiss Republic is not homogeneous. I deny it. The difference in language, the difference, not in race (for there is no difference in race in the Swiss Republic), but the difference in varieties of the same race that are analogous, that are consistent with each other, does exist, and they get on. Does my honorable friend think that it is an advantage to a republic that its citizens should be made up of diverse races, of diverse views, of diverse obligations, of diverse opinions as to what the common prosperity of all requires? He can not say so. I am sure he will not. Therefore, why is it that we are so continually reminded by my honorable friend and others that we are violating the principles of the foundation of republican governments in undertaking to say this simple thing? I am

not speaking of the way we are saying it at this moment, but the principle that lies at the bottom of this bill and which surrounds it on every side, as to the right of the people of the United States, consistently with the moral law, with the law of Christianity, and with the law of nations, to make a regulation as to the reception of foreigners into the body of our Commonwealths. That is the proposition. My honorable friend has not denied what I stated yesterday, that every book upon natural law or public law that I have had the pleasure of reading asserts what I have asserted.

"I repeat what I stated yesterday, that so long as you are to have government at all, that government, like a family or a partnership, must be the judge for itself as to what persons it will take into the body of the people, that at the last in our form of government constitute the Government itself. It has always been so; it always will be so as long as governments last. You can not have a government without it; you never have had one without it.

"So, then, we stand; and these Chinamen having a right to come here under the Burlingame treaty, and it being thought, wisely or unwisely, with prejudice or without, that their coming in the numbers and in the way and of the character that they did was injurious to the interests of the United States, it was provided by another treaty that the old treaty should be abrogated, and that the United States should be remitted to its original natural right as a government of determining as to a certain part of these Chinese people, named, specified, and described, whether they should come or not within a reasonable period of time, in order to test the question by the experiment as far as we had it already. Where is the harm in that upon the widest principles of fair play, upon the widest humanity, unless you say that there is nothing in the nature of a government which entitles one people to be the judges for themselves of whom they shall take in? I say that to maintain that doctrine is to maintain a proposition that is contrary to all human experience, is contrary to all human discussion almost, until within a very short period, and is contrary to every step that our fathers from their Declaration of Independence to this day have declared. There is now upon your statute-book a law which condemns the cooly trade, as it is called, and punishes it by penalties more severe, I think—I have not looked at it lately—than the penalties of this bill, and which puts, on the argument of the Senator from Massachusetts, the seal of its unjust condemnation upon the man who is a servant. We may, therefore, if that law be one that can stand, say that a man shall not be brought into this country, or in an American vessel carried to any other, who is under any contract to serve another man as a servant; but we may not say that he shall not come into our country in his character as a mere laborer for ten years or twenty years, as the case may be?

How can you distinguish? And yet, I believe—I am not sure that I am right about that—that this cooly bill came from the magnanimous heart and the large brain of the predecessor of my honorable friend from Massachusetts, Sumner, the advocate of human rights as his successor is, and as I hope I and my colleague would be in our humble and more simple way. I think it came from him. I remember once certainly that he introduced a bill into this body to improve that act which I think he was the author of in the first place, and which declared, if I remember it correctly, that the penalties of the law should be imposed upon any master of an American vessel that carries a Chinaman who is a servant—it does not say ‘laborer,’ but ‘servant’—anywhere on the face of the globe to be a servant for any man. Of course that does not prove that that law is right, but it seems to prove that it was thought by somebody before us to-day that it was a part of the just mission of every government to be entitled to have an opinion, and to enforce it upon such subjects.

“That is what seems to me to be the state of this case, sir, and while I shall feel compelled to vote against this bill if the twenty years’ clause is retained, and I shall earnestly hope that it will never become a law, it will not be because I do not believe in the right of the Government of the United States to determine as to everybody, upon any ground that seems good to itself, what persons from abroad shall form a part of our political communities, and compose a part of the people of the United States.”

Mr. Hoar: “Mr. President, I wish only to say a word. The honorable Senator from Vermont challenged me to produce from the writers on public law any who affirmed the obligation of a people to receive persons from any other nation whom they thought fit to exclude. The Senator from Vermont knows very well that all the writers on public law, with scarcely an exception, deny altogether the American doctrine of expatriation, and the same authorities which affirm the right of the people to exclude affirm the right of the sovereign from whom the subject wishes to depart to retain. The American doctrine is different. The American doctrine affirms, as the Declaration of Independence affirms and as the New Testament affirms, as I read it—two authorities which lie at the very foundation of all law, domestic, international, individual, which governs mankind—that the right is equal, that the human being has the right, conforming to law, conforming to the proper regulations of the place to which he goes, to go and seek his fortune, and to earn his living by honest labor.

“The Senator seems to me, when he alludes to the right of Congress to pass laws providing for naturalization, to confound two very distinct things. We may undoubtedly regulate the conditions upon which the citizens of a foreign country shall be admitted to citizen-

ship here; we may undoubtedly establish rules or fix a period of time which will make it certain that that citizen of a foreign country has renounced his old allegiance, and has acquired sufficient knowledge of and respect for our institutions to make a good citizen, just as we, the legislative power, properly fix the age of twenty-one or twenty-five, or what other age the experience of mankind dictates, at which the native may exert the one great privilege of citizenship, that of voting. But would the Senator argue from the right of the legislative power to fix twenty-one years as the earliest age at which a person may exercise the privilege of a voter the power to deny or to deny any particular race the right to vote altogether?

“The Declaration of Independence and the Constitution are full of implied affirmations of the truth of the doctrine upon which I stand. Among the charges against the monarch of Great Britain which justified the separation was the fact that although our fathers recognized his rightful share of legislative power over the colonies and never before denied it, they charged as one of the great abuses which justified the separation that—

He has endeavored to prevent the population of these States; for that purpose obstructing the laws for naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

“The Constitution itself assumes that the naturalization of persons of other communities will be unrestricted except within the reasonable limit which I have stated, and provides that Congress shall pass laws for the naturalization of foreigners which shall be uniform, not which shall distinguish between races and between nationalities. The fourteenth amendment, in the adoption of which I suppose the honorable Senator from Vermont himself bore a conspicuous part, as he does in all legislation here, provides that every person born in the United States becomes from that fact a citizen thereof. The children of any of the Chinese laborers now in California become citizens by the affirmation in the Constitution itself of the natural fitness of all men for republican life and their natural equality without regard to race.

All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside.

“There is citizenship by birthright, without regard to race or color or nationality. Then the fifteenth amendment supplements it by the provision that this citizenship which is a birthright shall carry with it the right of citizens to vote, or that that right ‘shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.’

“So that this legislation is not only in violation of the treaty, not only in violation of the solemn affirmation of Congress that the right

of expatriation carries with it the right of citizenship of the country where a man goes, but it is equally in violation of the Declaration of Independence and the spirit of the Constitution of the United States.

"Mr. President, it requires no deduction even from the statement of the honorable Senator from Vermont but only his application to see that his argument involves the right to exclude from this country all the naturalized citizens if Congress sees fit to exercise it. If you may shut the door, you may put outside the person who is here contrary to the interest of the people and without right. Will the honorable Senator from Vermont affirm that if that reconsideration of the relation of the African race to citizenship, which the Senator from Mississippi seems to foreshadow, should ever come, we may rightfully, consistently with the doctrine of the Declaration of Independence, expel persons of the African race from this country and deport them to Liberia?"

Mr. Edmunds: "Mr. President, the principle upon which we say in regard to the right to vote that no male citizen shall vote until he is twenty-one years of age if you please, is that it belongs to the body of the people who compose the Government to say how political power shall be exercised. Otherwise the people would have no right at all to say that a man of twenty-one should vote; they would have no right to say anything about it. He had got the natural right at the very moment he was born to vote, at least once; I will not say how much more often. That doctrine will not stand, Mr. President."

Mr. Hoar: "May I ask the honorable Senator if he means to affirm that the right in a body-politic to fix twenty-one years or some other limit for coming to the right to vote in its discretion, involves the power to limit altogether the coming to that right to vote of certain races or classes, if it sees fit?"

Mr. Edmunds: "I am not speaking of races at all."

Mr. Hoar: "Classes, then."

Mr. Edmunds: "I am speaking on this bill of human beings who are not members now of the political community of the United States and who wish to become such, as it is said by my friend from Massachusetts, and that we are perpetrating a great wrong upon them in saying that we are not willing just now that they shall. That is what I am speaking of."

Mr. Hoar: "If the Senator will pardon me—I ought to ask his pardon for interrupting him—the Senator took as an illustration of the power the right to fix twenty-one years or some other time as the age for voting, and I desire to understand if he infers from the fact that the public has that right, that it has the right to exclude altogether any class of citizens in the community from voting, because, as I understood, he argued from the right to limit the period of naturalization of foreigners the

right to exclude them altogether. Now, I say those are very different things."

Mr. Edmunds: "If I did argue, as I did, from the acknowledged right, as I think it is now admitted even by the Senator from Massachusetts, of the Government of the United States to fix a period for the naturalization of foreigners, I deduce from that the right of the United States to fix that period at ten thousand years if the United States think it is well for the people of the United States to do that thing, and I say also that under the Declaration of Independence and the Constitution of the United States, which I still believe in, it is within the competence of Congress, as it has exercised it, always to decide upon receiving into this country as one of its people anybody, to require a test of opinion, as extreme as that may be, because the first naturalization law and the last naturalization law all the time requires that a candidate for admission into the body of the people of this country shall have certain opinions that that law defines. These opinions are required to be, very wisely I think, republican, that they shall believe in republican government as against the domination of emperors and kings.

"Where do we get the right to test the admission of anybody into this country on the ground of his opinions? We get it, if we get it at all—and I am quite clear that we have it—on the fundamental principle I have endeavored so often to state, and which my friend from Massachusetts, I do not understand except by the course of his argument plainly to deny, that it is the right of every government, if it be a government, to determine what persons shall come into it from outside of it and be a part of it. If we have not that right, then we have not any right to make a naturalization law at all; then the moment any foreigner, be he good or bad, be he a saint or a sinner, sets his foot upon the shores of this American Republic, he has the same rights in every respect that the Senator from Massachusetts and I have. I deny the proposition. All civilized laws everywhere in the whole course of history have denied it, because they have recognized that it was essential to the existence of a government, if you had any government at all, that that government, like a family or a partnership, must receive into it only those persons whom it was willing to receive. It was a compact that required the assent of the whole, not of one party but of both.

"Mr. President, there is one other thing that I disagree with my friend from Massachusetts about, and perhaps that is of no importance to anybody but my friend from Massachusetts and myself; and that is the New Testament. My friend says that it is the doctrine of the New Testament that it is the right of every man to go everywhere, and to participate with all others in everything that they enjoy, if I correctly understand him. I deny it. By the New Testament, as it is understood in this

country, and has been ever since it was founded, in all of its churches, Republican churches, and I will say Democratic churches, the Congregational churches that prevail in New England more than any other, the member of one church constituting that one religious family analogous to a political family who undertakes to leave the church that he belongs to and go to another has not even the right of expatriation; he must get a letter of credence, and having got it he must submit it to the will of the church that he desires fellowship with, and get the vote of that church to admit him. That is the New Testament as it is understood in Vermont, and I think rightly, and it rests upon that infinite and persistent common sense that all human history has proved to be wisest and best, that every people and every church, every little community in regard to its own particular affairs must decide what persons other than itself are to be received into it, and become a part of it. And I think at this day that the Constitution of Massachusetts itself undertakes, through the political opinions of those who are voters there and their political action, to settle not only the age as to voting but the quality and condition of the man who shall vote, that he must possess certain qualities that he can not outgrow by the mere lapse of time, that he must be in a particular condition of worldly estate; he must not be a pauper, that he must be in a particular condition of mind, he must not be what the majority of the people consider to be insane; that he must not have been convicted of some crime, that he must possess this, that, and the other quality. Where did the people of Massachusetts get the right to impose any such conditions upon a human being? Any one coming there has a right to judge as well as they, is the argument of my friend from Massachusetts, but that gives away the whole case of every government and turns the whole world into one hotch-potch; and the ladies and gentlemen in the galleries, on that doctrine, have got the same right to come down here and vote and discuss that we have, because when we set up an arbitrary exclusion and say nobody shall come in here and argue and talk and vote, unless he has the certificate of some State or something of that kind, what are you going to do with human rights in a case of that kind? The argument goes to the destruction of all order and government from the top to the bottom.

"Sir, in what I have said I do not wish to be understood as saying that this bill in regard to the condition of affairs is politic or impolitic. That is not the question. I only undertook to defend the right of the people of the United States to determine for themselves according to their own honest judgment of their own interests, consistent with justice to others, who shall enter into their borders, who shall compose a part of their people. That is all."

Mr. Torrey of Colorado: "As I understand the Senators from Massachusetts, who seem

to be the principal opponents of this bill on this floor, take the position that the bill is contrary to equity, a violation of fundamental principles, a violation of the rights of man that are recognized in the Declaration of Independence and that have been recognized by the Republican party in its history always. Mr. President, if that is true, I should feel very loath myself to vote for it unless the evils were of such magnitude as to render it necessary that I should, in the language of the country, go back upon my record. I am like the Senator from Kansas; I do not yield in my devotion to these principles to anybody. The belief in the right of all men to labor and eat the bread they have earned by their labor is not a new-born thing with me, But I do not understand that any such thing exists. I understand that this is a right which is recognized by every nation in the world, and by everybody in the world almost, unless it may be the Senators from Massachusetts, a right that was recognized in the Constitution of Massachusetts in 1780, when they declared in so many words for this kind of legislation. I have it right here, and I will call the attention of the Senate to it:

The end of the institution, maintenance, and administration of government is to secure the existence of the body-politic, to protect it, and to furnish the individuals who compose it with the power of enjoying, in safety and tranquillity, their natural rights and the blessings of life; and whenever these great objects are not obtained the people have a right to alter the government, and to take measures necessary for their safety, prosperity, and happiness.

"That has been the doctrine of all liberal-minded men everywhere at all times. There have been, I will admit, a few people who have risen to the dignity of writing upon this question, who have occasionally asserted, as was said here the other day, that the human race is one family, and that the same obligations on the part of the Government of this country exist toward the people of any other country that exist with reference to its own citizens; but they are numerically so small and so insignificant that they have never impressed those ideas upon the body-politic of any nation in the world. It can not be, Mr. President, that one nation will legislate for the interest of all mankind. They will legislate for the interest of their own people first, and that is what they ought to do.

"In 1880 the Republican party assembled in convention at Chicago, a convention composed of the leading minds of the Republican party. Presiding over that convention was the Senator from Massachusetts (Mr. Hoar), and we appointed at that convention our representative men on a committee to go out and bring back a declaration of our principles. We expected to promulgate those principles and go to the people and demand their suffrage, and we declared in our platform for this kind of legislation and we pledged ourselves to work for this kind of legislation. Did the Senator

from Massachusetts rise in his seat then and answer and say, 'Why, this is contrary to the fundamental principles of the Declaration of Independence; this is a violation of the rights of humanity, and it ought not to be done?' The candidate nominated by that convention published to the world his letter of acceptance, in which he not only accepted the doctrines laid down in the platform *en masse*, but proceeded to speak on this very question and to put himself on record in favor of the right of the Government, its legal right, its moral right, to restrict this class of immigration; and it does not come with a right good grace that the two Senators from Massachusetts should now assume all the virtue in the Republican party, and accuse everybody else who differs with them on this subject of being moved by hate, as the honorable Senator who addressed the Senate yesterday (Mr. Dawes) declared we all were."

The President *pro tempore*: "Does the Senator from Kansas withdraw the whole of his amendment, including the words which he moved to insert?"

Mr. Ingalls: "Yes, sir."

The President *pro tempore*: "The question is on the amendment as modified, substituting ninety days for sixty days."

The amendment to the amendment was agreed to—yeas, 26; nays not counted.

The President *pro tempore*: "The roll will be called on the passage of the bill."

The result was announced—yeas 29, nays 15; as follows:

YEAS—Bayard, Beck, Call, Cameron of Wisconsin, Cockrell, Coke, Fair, Farley, Garland, George, Gorman, Hale, Harris, Hill of Colorado, Jackson, Jonas, Jones of Nevada, Miller of California, Miller of New York, Morgan, Pugh, Ransom, Sawyer, Slater, Teller, Vance, Vest, Voorhees, Walker—29.

NAYS—Aldrich, Allison, Blair, Brown, Conger, Davis of Illinois, Dawes, Edmunds, Frye, Hoar, Ingalls, Lapham, McDill, McMillan, Morrill—15.

ABSENT—Anthony, Butler, Camden, Cameron of Pennsylvania, Davis of West Virginia, Ferry, Groome, Grover, Hampton, Harrison, Hawley, Hill of Georgia, Johnston, Jones of Florida, Kellogg, Lamar, Logan, McPherson, Mahone, Maxey, Mitchell, Pendleton, Platt, Plumb, Rollins, Sainsbury, Saunders, Sewell, Sherman, Van Wyck, Williams, Windom—32.

So the bill was passed.

In the House, on March 23d, the bill was passed by the following vote:

YEAS—Aiken, Aldrich, Armfield, Atkins, Bayne, Belford, Belmont, Berry, Bingham, Blackburn, Blanchard, Bliss, Blount, Brewer, Brumm, Buckner, Joseph H. Burrows, Butterworth, Cabell, Caldwell, Calkins, Campbell, Cannon, Cassidy, Caswell, Chalmers, Chapman, Clark, Clements, Cobb, Converse, Cook, Cornell, Samuel S. Cox, William R. Cox, Covington, Cravens, Culberson, Curtin, Darrell, Davidson, George R. Davis, Lowndes H. Davis, De Motte, Deuster, Dezendorf, Dibble, Dibrell, Dowd, Dugro, Ermentrout, Errett, Charles B. Farwell, Finley, Flower, Ford, Forney, Fulkerson, Garrison, Geddes, George, Gibson, Guenther, Gunter, N. J. Hammond, Hardy, Harner, Henry S. Harris, Haseltine, Hatch, Hazelton, Heilmann, Herndon, Abram S. Hewitt, Hill, Hiseock, Hoblitzell, Hoge, Holman, Horr, Houk,

House, Hubbell, Hubbs, Hutchins, George W. Jones, James K. Jones, Jorgensen, Kenna, King, Klotz, Knott, Ladd, Leedom, Lewis, Marsh, Martin, Matson, McClure, McCook, McKenzie, McKinley, McLane, McMillin, Miller, Mills, Money, Morey, Moulton, Murch, Mutchler, O'Neill, Pacheco, Page, Paul, Payson, Peelle, Phelps, Phister, Pound, Randall, Reagan, Theron M. Rice, John S. Richardson, Robertson, William E. Robinson, Rosecrans, Scranton, Shallenberger, Sherwin, Simonton, Otho R. Singleton, A. Herr Smith, Dietrich C. Smith, J. Hyatt Smith, Sparks, Spaulding, Speer, Springer, Stockslager, Strait, Talbott, Thomas, P. B. Thompson, Tillman, Amos Townsend, R. W. Townsend, Tucker, Henry G. Turner, Oscar Turner, J. T. On April 4th President Arthur returned the bill to the Senate, with his objections to it, as follows:

*To the Senate of the United States:*

After careful consideration of Senate bill No. 71, entitled "An act to execute certain treaty stipulations relating to Chinese," I herewith return it to the Senate, in which it originated, with my objections to its passage.

A nation is justified in repudiating its treaty obligations only when they are in conflict with great paramount interests. Even then all possible reasonable means for modifying or changing those obligations by mutual agreement should be exhausted before resorting to the supreme right of refusal to comply with them.

These rules have governed the United States in their past intercourse with other powers as one of the family of nations. I am persuaded that if Congress can feel that this act violates the faith of the nation as pledged to China, it will concur with me in rejecting this particular mode of regulating Chinese immigration, and will endeavor to find another which shall meet the expectations of the people of the United States without coming in conflict with the rights of China.

The present treaty relations between that power and the United States spring from an antagonism which arose between our paramount domestic interests and our previous relations.

The treaty commonly known as the Burlingame treaty conferred upon Chinese subjects the right of voluntary emigration to the United States for the purposes of curiosity or trade, or as permanent residents,

and was in all respects reciprocal as to citizens of the United States in China. It gave to the voluntary emigrant coming to the United States the right to travel there or to reside there, with all the privileges, immunities, or exemptions enjoyed by the citizens or subjects of the most favored nation.

Under the operation of this treaty it was found that the institutions of the United States and the character of its people and their means of obtaining a livelihood might be seriously affected by the unrestricted introduction of Chinese labor. Congress attempted to alleviate this condition by legislation, but the act which it passed proved to be in violation of our treaty obligations, and, being returned by the President with his objections, failed to become a law.

Diplomatic relief was then sought. A new treaty was concluded with China. Without abrogating the Burlingame treaty, it was agreed to modify it so far that the Government of the United States might regulate, limit, or suspend the coming of Chinese laborers to the United States or their residence therein, but that it should not absolutely prohibit them, and that the limitation or suspension should be reasonable and should apply only to Chinese who might go to the United States as laborers, other classes not being included in the limitations. This treaty is unilateral, not reciprocal. It is a concession from China to the United States in limitation of the rights which she was enjoying under the Burlingame treaty. It leaves us by our own act to determine when and how we will enforce those limitations. China may, therefore, fairly have a right to expect that in enforcing them we will take good care not to overstep the grant, and take more than has been conceded to us.

It is but a year since this new treaty, under the operation of the Constitution, became part of the supreme law of the land; and the present act is the first attempt to exercise the more enlarged powers which it relinquishes to the United States.

In its first article the United States is empowered to decide whether the coming of Chinese laborers to the United States, or their residence therein, affects or threatens to affect our interests, or to endanger good order either within the whole country or in any part of it. The act recites that, "in the opinion of the Government of the United States, the coming of Chinese laborers to this country endangers the good order of certain localities thereof." But the act itself is much broader than the recital. It acts upon residence as well as immigration, and its provisions are effective throughout the United States. I think it may fairly be accepted as an expression of the opinion of Congress that the coming of such laborers to the United States, or their residence here, affects our interests and endangers good order throughout the country. On this point I should feel it my duty to accept the views of Congress.

The first article further confers the power upon this Government to regulate, limit, or suspend, but not actually to prohibit the coming of such laborers to, or their residence in, the United States. The negotiators of the treaty have recorded with unusual fullness their understanding of the sense and meaning with which these words were used.

As to the class of persons to be affected by the treaty, the Americans inserted in their draft a provision that the words "Chinese laborers" signify all immigration other than that for "teaching, trade, travel, study, and curiosity." The Chinese objected to this that it operated to include artisans in the class of laborers whose immigration might be forbidden. The Americans replied that they "could" not consent that artisans shall be excluded from the class of Chinese laborers, for it is this very competition of skilled labor, in the cities where the Chinese labor immigration concentrates, which has caused the embarrassment and popular discontent. In the subsequent negotiations this definition dropped out, and does not appear in the treaty. Article II of the treaty confers the rights, privileges, immunities, and exemptions which are accorded to citizens and subjects of

the most favored nation upon Chinese subjects proceeding to the United States as teachers, students, merchants, or from curiosity. The American commissioners report that the Chinese Government claimed that in this article they did, by exclusion, provide that nobody should be entitled to claim the benefit of the general provisions of the Burlingame treaty but those who might go to the United States in those capacities or for those purposes. I accept this as the definition of the word "laborers" as used in the treaty.

As to the power of legislating respecting this class of persons, the new treaty provides that we "may not absolutely prohibit" their coming or their residence. The Chinese commissioners gave notice in the outset that they would never agree to prohibition of voluntary emigration. Notwithstanding this the United States commissioners submitted a draft in which it was provided that the United States might "regulate, limit, suspend, or prohibit" it. The Chinese refused to accept this. The Americans replied that they were "willing to consult the wishes of the Chinese Government in preserving the principle of free intercourse between the people of the two countries, as established by existing treaties, provided that the right of the United States Government to use its discretion in guarding against any possible evils of immigration of Chinese laborers is distinctly recognized. Therefore, if such concession removes all difficulty on the part of the Chinese commissioners (but only in that case), the United States commissioners will agree to remove the word "prohibit" from their article, and to use the words "regulate, limit, or suspend." The Chinese reply to this can only be inferred from the fact that in the place of an agreement, as proposed by our commissioners, that we might prohibit the coming or residence of Chinese laborers, there was inserted in the treaty an agreement that we might not do it.

The remaining words, "regulate, limit, and suspend," first appear in the American draft. When it was submitted to the Chinese they said: "We infer that of the phrases regulate, limit, suspend, or prohibit, the first is a general expression referring to the others. We are entirely ready to negotiate with your excellencies to the end that a limitation either in point of time or of numbers may be fixed upon the emigration of Chinese laborers to the United States." At a subsequent interview they said that "by limitation in number they meant, for example, that the United States having, as they supposed, a record of the number of immigrants in each year, as well as the total number of Chinese now there, that no more should be allowed to go in any one year in future than either the greatest number which had gone in any year in the past, or that the total number should never be allowed to exceed the number now there. As to limitation of time they meant, for example, that Chinese should be allowed to go in alternate years, or every third year, or, for example, that they should not be allowed to go for two, three, or five years." At a subsequent conference the Americans said: "The Chinese commissioners have in their project explicitly recognized the right of the United States to use some discretion, and have proposed a limitation as to time and number. This is the right to regulate, limit, or suspend."

In one of the conferences the Chinese asked the Americans whether they could give them any idea of the laws which would be passed to carry the powers into execution. The Americans answered that this could hardly be done; that "the United States Government might never deem it necessary to exercise this power. It would depend upon circumstances. If Chinese immigration concentrated in cities where it threatened public order, or if it confined itself to localities where it was an injury to the interests of the American people, the Government of the United States would undoubtedly take steps to prevent such accumulations of Chinese. If, on the contrary, there was no large immigration, or if there were sections of the country where such immigration was clearly

beneficial, then the legislation of the United States, under this power, would be adapted to such circumstances. For example, there might be a demand for Chinese labor in the South and a surplus of such labor in California, and Congress might legislate in accordance with these facts. In general, the legislation would be in view of and depend upon the circumstances of the situation at the moment such legislation became necessary." The Chinese commissioners said this explanation was satisfactory; that they had not intended to ask for a draft of any special act, but for some general idea how the power would be exercised. What had just been said gave them the explanation which they wanted.

With this entire accord as to the meaning of the words they were about to employ, and the object of the legislation which might be had in consequence, the parties signed the treaty, in Article I of which "the Government of China agrees that the Government of the United States may regulate, limit, or suspend such coming or residence, but may not absolutely prohibit it. The limitation or suspension shall be reasonable, and shall apply only to Chinese who may go to the United States as laborers, other classes not being included in the limitations. Legislation taken in regard to Chinese laborers will be of such a character only as is necessary to enforce the regulation, limitation, or suspension of immigration."

The first section of the act provides that "from and after the expiration of sixty days next after the passage of this act, and until the expiration of twenty years next after the passage of this act, the coming of Chinese laborers be, and the same is hereby, suspended, and during such suspension it shall not be lawful for any Chinese laborer to come, or having so come after the expiration of said sixty days, to remain within the United States."

The examination which I have made of the treaty, and of the declarations which its negotiators have left on record of the meaning of its language, leaves no doubt in my mind that neither contracting party in concluding the treaty of 1880 contemplated the passage of an act prohibiting immigration for twenty years, which is nearly a generation, or thought that such a period would be a reasonable suspension or limitation, or intended to change the provisions of the Burlingame treaty to that extent. I regard this provision of the act as a breach of our national faith; and being unable to bring myself in harmony with the views of Congress on this vital point, the honor of the country constrains me to return the act with this objection to its passage.

Deeply convinced of the necessity of some legislation on this subject, and concurring fully with Congress in many of the objects which are sought to be accomplished, I avail myself of the opportunity to point out some other features of the present act which, in my opinion, can be modified to advantage.

The classes of Chinese who still enjoy the protection of the Burlingame treaty are entitled to the privileges, immunities, and exemptions accorded to citizens and subjects of the most favored nation. We have treaties with many powers which permit their citizens and subjects to reside within the United States and carry on business under the same laws and regulations which are enforced against citizens of the United States. I think it may be doubted whether provisions requiring personal registration and the taking out of passports which are not imposed upon natives can be required of Chinese. Without expressing an opinion on that point, I may invite the attention of Congress to the fact that the system of personal registration and passports is undemocratic and hostile to the spirit of our institutions. I doubt the wisdom of putting an entering-wedge of this kind into our laws. A nation like the United States, jealous of the liberties of its citizens, may well hesitate before it incorporates into its polity a system which is fast disappearing in Europe before the progress of liberal institutions. A wide experience has shown how futile such precautions are, and how easily passports

may be borrowed, exchanged, or even forged by persons interested to do so.

If it is nevertheless thought that a passport is the most convenient way for identifying the Chinese entitled to the protection of the Burlingame treaty, it may still be doubted whether they ought to be required to register. It is certainly our duty under the Burlingame treaty to make their stay in the United States, in the operation of general laws upon them, as nearly like that of our own citizens as we can consistently with our right to shut out the laborers. No good purpose is served in requiring them to register.

My attention has been called by the Chinese minister to the fact that the bill as it stands makes no provision for the transit across the United States of Chinese subjects now residing in foreign countries. I think that this point may well claim the attention of Congress in legislating on this subject.

I have said that good faith requires us to suspend the immigration of Chinese laborers for a less period than twenty years; I now add that good policy points in the same direction.

Our intercourse with China is of recent date. Our first treaty with that power is not yet forty years old. It is only since we acquired California and established a great seat of commerce on the Pacific that we may be said to have broken down the barriers which fenced in that ancient monarchy. The Burlingame treaty naturally followed. Under the spirit which inspired it many thousand Chinese laborers came to the United States. No one can say that the country has not profited by their work. They were largely instrumental in constructing the railways which connect the Atlantic with the Pacific. The States of the Pacific slope are full of evidences of their industry. Enterprises profitable alike to the capitalist and to the laborer of Caucasian origin would have lain dormant but for them. A time has now come when it is supposed that they are not needed, and when it is thought by Congress and by those most acquainted with the subject that it is best to try to get along without them. There may, however, be other sections of the country where this species of labor may be advantageously employed without interfering with the laborers of our own race. In making the proposed experiment, it may be the part of wisdom as well as of good faith to fix the length of the experimental period with reference to this fact.

Experience has shown that the trade of the East is the key to national wealth and influence. The opening of China to the commerce of the whole world has benefited no section of it more than the States of our own Pacific slope. The State of California, and its great maritime port especially, have reaped enormous advantages from this source. Blessed with an exceptional climate, enjoying an unrivaled harbor, with the riches of a great agricultural and mining State in its rear, and the wealth of the whole Union pouring into it over its lines of railway, San Francisco has before it an incalculable future if our friendly and amicable relations with Asia remain undisturbed. It needs no argument to show that the policy which we now propose to adopt must have a direct tendency to repel Oriental nations from us, and to drive their trade and commerce into more friendly lands. It may be that the great and paramount interest of protecting our labor from Asiatic competition may justify us in a permanent adoption of this policy. But it is wiser, in the first place, to make a shorter experiment, with a view hereafter of maintaining permanently only such features as time and experience may command.

I transmit herewith copies of the papers relating to the recent treaty with China which accompanied the confidential message of President Hayes to the Senate of the 10th of January, 1881, and also a copy of a memorandum respecting the act herewith returned, which was handed to the Secretary of State by the Chinese minister in Washington.

CHESTER A. ARTHUR.

EXECUTIVE MANSION, WASHINGTON, April 4, 1882.

The bill, upon being reconsidered with the President's objections by the Senate, on April 5th, failed to pass.

Subsequently, on April 17th, a bill "to execute certain treaty stipulations relating to the Chinese" was reported from the Committee on Education in the House.

Mr. Bragg, of Wisconsin: "I desire to know how and why, under the rules of this House, a bill entitled a bill to execute certain treaty stipulations, prescribing intercourse between this Government and a foreign nation, making regulations concerning immigration, and affecting the naturalization laws, comes from the Committee on Education and Labor."

The Speaker: "Because the subject was referred to that committee."

Mr. Willis, of Kentucky: "Mr. Speaker, I intend to vote for this bill; and I hope every one who voted for the vetoed bill will vote for this bill. But, sir, I reserved to myself the right in committee, and I exercise that right now, to utter my solemn protest against the action of the committee in placing before us a bill which makes a hasty and unnecessary if not a cowardly surrender of all our rights both under this treaty and under natural and constitutional law."

"I object to the bill not only on account of the absence of the penalty clause, but because the whole system of registration is cut out. Every bill on this subject that has been thus far presented to Congress has recognized the necessity for some system of registration. Without such a system it will be as difficult to know and to protect the 105,000 Chinese now here as it will be impossible to prevent the unlawful coming and residence of those who are now in China. You first strike out the penalty by which Chinamen are punished for coming here unlawfully, and then you cut out the provision for registration, thus rendering it utterly impossible to distinguish or identify the lawful from the unlawful residents. Could the door for Chinese immigration be more widely and safely opened?"

"But, sir, the last and the principal objection which we, the minority of the committee, urge against this bill is the ten-year clause. For over twenty-five years the Pacific States have been cursed with the evils of Chinese immigration; the peace and order of society have been disturbed; the interests of good government jeopardized; the rights and comforts of honorable labor have been overthrown, and its worthy representatives driven into poverty and exile by an invading race, self-determined upon alien, sordid, and unrepugnant habits. Will such a bill as this bring back peace and order to those burdened and excited communities? Will it restore their social and industrial interests to their safe and normal condition? Will not the people of the invaded States regard a ten-year suspension as a mere temporizing expedient; a brief and restless respite; and not a substantial, permanent relief against the

evils which beset them? After twelve years of urgent appeal will they accept this as the finality; the full and satisfactory reward of their long, patient, and hopeful waiting?"

Mr. Page, of California: "Mr. Speaker, I do not believe the gentleman from Kentucky has a right to complain. There has been no attempt on this side of the House or by myself to deprive any member of the House of the right to debate this question."

"All I ask is, and I earnestly appeal to all the members upon this floor, to relieve the people of the Pacific coast by giving them some legislation. Let this be placed upon the statute-books of the nation. Let that people to-day be relieved of this terrible evil of which they complain. And if it shall fall to the lot of either side of this House to gain political advantage, let that be so. I am not here to urge this as a party measure, but to accept it as being the best thing we can do."

"While the gentleman from Kentucky stated that he spoke for the Pacific coast, and that this bill was practically better than nothing, I believe, Mr. Speaker, and I know I speak both my own sentiment and the sentiment of a large portion of that people when I say that some of the sections included in this bill are far better for our people than the sections contained in the vetoed bill."

"We have reduced the limitation of suspension from twenty years to ten. While we voted, some of us for twenty years, if there had been a reasonable chance for fifteen years I would have voted for that. But my judgment is we can not afford to place the President in the position of being compelled to sign or veto a fifteen years' bill after having vetoed a twenty years' bill. I believe ten years will give us relief. I ask the members of this House to give us this bill of ten years; and before the expiration of those ten years I trust there will be a public sentiment in this country that will unanimously extend the term of limitation."

This modified bill passed both Houses, and was approved by the President.

The session closed on August 8th.

CONNECTICUT. The State officers during 1882 were: Governor, Hobart B. Bigelow; Lieutenant-Governor, William H. Bulkeley; Secretary of State, Charles E. Searls; Treasurer, David P. Nichols; Comptroller, Wheelock T. Bachellor.

THE LEGISLATURE.—The members of the Legislature convened at the Capitol for the biennial session of 1882, on January 4th, and both Houses were speedily organized. In the Senate, Robert Colt, from the Ninth District, was elected President *pro tempore*, over his competitor, Rial Strickland, from the Second District, on a vote of 16 to 7; and, in the Lower House, John M. Hall, of Windham, was elected Speaker over George G. Sill, of Hartford, upon a vote of 138 to 89.

A few hours later Governor Bigelow sent his message on public affairs through the Ex-

Executive Secretary, who read it to the joint Assembly, the two Houses having come together for that purpose. He called the attention of the Legislature to the fact that Long Island Sound, the great commercial thoroughfare of Connecticut on her southern boundary, was practically without defense, as there were no fortifications worthy of the name between the ocean and the sea-ports of the State, which was thus exposed to an attack from the sea. The State depends, in this matter, wholly upon the Federal Government. The Governor, therefore, urged the General Assembly to take such action as would call the attention of the Federal Government to their defenseless condition, and induce her to provide for it against any possible emergency.

From the report of the directors of the Agricultural Experiment Station, which was established, by act of the Legislature, in 1877, it appears that, during the year 1881, the station's work has been mostly directed to the examination of commercial fertilizers, fodder, and feed-stuffs produced, or used, in Connecticut, and to the examination of milk and dairy products. As this station had no place of its own for attending to its operations, but from the beginning was kindly tendered the use of certain rooms in Yale College for five years, till June, 1882, the Board of Control requested of the Legislature that it might be furnished with the means of carrying on its work independently and efficiently. Connecticut was the first among all the States of the Union to create and put to practical work an agricultural experiment station. Its lead in the establishment of this service has been followed by many other States. They have recognized the wisdom of the action, and have created institutions for the same ends. Most of these are on a larger scale.

The Storrs Agricultural School was authorized by an act of the Legislature in 1881, and actually opened on the 28th of September of that year, and now is in operation, with three instructors and thirteen scholars. It is the first of its kind in this country, and, having no example to follow, it must reach success through experience. It is intended to be more technical, and nearer the farm, than the Agricultural College has been or well can be. Its object is not to make scholars, but to train young men to be well-informed and skillful farmers.

Two acts were passed at this session—the one “appropriating twenty-five thousand dollars for the erection of a building for the Agricultural Experiment Station”; the other, “providing for regular annual appropriations to agricultural societies.”

With reference to the law enacted in 1881, providing for the licensing of pharmacists in the State, and for the registering of poisons sold by druggists to private people; creating, also, a Commission of Pharmacy, charged to see that its provisions are faithfully carried

into execution—the commission have reported that “the law works well, and meets the requirements of public safety.” The list of poisons, the sale of which is reckoned as subject to the duty of registration, is found to be too restricted, and should be extended by adding to it “laudanum, and other dangerous forms of opium.”

Since July 20, 1881, when the newly-finished portion of the Insane Asylum at Middletown, the South Hospital, was opened for the reception of patients, above two hundred have been lodged in it, in addition to the inmates of the old hospital, the year 1881 having begun with 529 insane persons under treatment and ended with 731, of which number not less than 719 belong to the indigent class, and “are aided by the State”; but, notwithstanding this great draining, the almshouses of the towns are not yet relieved of them, and their number seems to be increasing.

The trustees of the Industrial School for Girls state that a large number of “neglected youth, of both sexes, may be found within the State growing up, without responsible guardianship, in varying conditions of ignorance and idleness, and plainly drifting toward a life of pauperism and crime”; adding, “They are to be found in the streets of the cities, in the almshouses of the towns, and in other places equally ill-fitted for making them good citizens.”

An act was passed at this session “creating a commission to consider the case of children now in almshouses.”

A new penitentiary building, in a healthy location, is called for, as the old State Prison, wherein the convicts are now confined, besides other reasons of unfitness, stands on a “manifestly unhealthy situation.” The number of sick, or sickly convicts, unable to work, is by that cause kept very large. It is said that about three fourths of the cases of disabling sickness can be traced to malarial disorders, which cause necessarily diminishes the income derived from the earnings of convicts, and increases the expenses of the State.

The reorganization of the courts of the State is strongly urged, as they “do not meet the just demands of the people.” This is especially the case with “the courts of first resort, or original jurisdiction.” The system of the justices of the peace is regarded as very defective. One thousand such justices are selected and installed every two years; little inquiry is made as to their capacity and fitness for the discharge of judicial duties.

A bill “creating the office of State Attorney-General” was introduced and acted upon at this session, but without final result; it was continued to the next General Assembly.

The Legislature closed its session of 1882 by final adjournment on April 20th. Among the bills then passed, or continued to the next Legislature, were the following:

A bill “to carry into effect the provisions

of the twenty-sixth amendment to the State Constitution"; "proposing a constitutional amendment to prohibit the manufacture and sale of intoxicating liquors"; "providing for the issue of \$500,000 of three and a half per cent twenty years' bonds, to take up and redeem outstanding State bonds"; "imposing a State tax of one and a quarter mill on the dollar, to be assessed on the grand list of October, 1881"; "providing that railroad bonds shall be taxed on their par value, unless they are below par"; "providing that all life-insurance companies may do accident-insurance business"; "providing that when twelve persons petition for temperance-instruction in the public schools, it shall be considered and decided upon by the school visitors"; "providing for the erection of a statue of Governor Buckingham in the Capitol Building."

The amounts of money from the State Treasury appropriated for various purposes at this session, besides the two items before mentioned relating to agriculture, are as follows: \$5,000 for the use of the Fish Commissioners; \$3,000 to buy additional land for the State Hospital for the Insane; \$5,000 to Thomas Lamb for work done on the Capitol building; \$5,000 for grading the Capitol grounds; \$2,500 for the State Library; and \$1,500 to the commission on the revision of the liquor laws, for services and expenses."

**STATISTICS.**—In obedience to the provision of the law enacted in 1878, "that the treasurer of every savings-bank in the State shall annually deliver to the Comptroller a sworn statement of the name, with amount to his credit, of every depositor who shall not have made a deposit, or drawn thereon for a period of more than twenty years next preceding," the Society for Savings at Hartford, a bank incorporated in 1848, has made this year the required return, the depositors unheard from for above twenty years, and named in the list, numbering 572; the aggregate amount of deposits unclaimed being \$74,817.21; the largest sum of single deposits, \$6,878.97; the smallest, \$1.39. There are in this list 22 names with \$1,000 and over placed to their credit; 62 with \$100 and over; and 51 with \$50 and over. These banks have on deposit over \$84,000,000, the largest amount ever held by them. There are 187,471 depositors, each having less than \$500 to his credit, and 50,522 each having over that sum.

The statistics of the railway lines operating within the limits of Connecticut for the year ending September 30, 1882, with the exception of the New York and New England, the Norwich and Worcester, and the New Haven and Northampton roads, were as follows:

**THE NEW YORK AND NEW HAVEN RAILROAD.**

Gross earnings .....	\$5,987,807 64
From passenger transportation.....	\$3,393,513 86
From freight transportation.....	2,065,355 52
Total operating expenses.....	3,803,678 97
Net earnings.....	\$2,184,128 67

The total number of passengers carried was

6,397,385, and the total number of miles traveled 8,697,211. It should be borne in mind that the returns of this road this year include the Shore Line division.

**THE CONNECTICUT WESTERN RAILROAD.**

Total operating expenses .....	\$316,470 20
Gross earnings.....	807,106 79
From passenger transportation.....	\$110,110 30
From freight transportation.....	184,078 24
Net deficit.....	\$9,368 41

The total number of passengers carried was 241,707; and the total miles run, 809,489. While the earnings of this road are \$4,681.65 more than last year, the operating expenses have also increased \$49,892.54. This large outlay has been expended in improving the road, greatly bettering its condition.

**THE CONNECTICUT VALLEY RAILROAD.**

Gross earnings .....	\$195,373 61
From passenger transportation.....	\$102,699 25
From freight transportation.....	77,980 18
Total operating expenses .....	195,083 82
Net earnings .....	\$289 79

Total number of passengers carried, 330,984; and total miles run, 228,024.

**THE AIR-LINE RAILROAD.**

Gross earnings .....	\$308,026 47
From passenger transportation.....	\$14,845 01
From freight transportation.....	74,965 09
Total operating expenses .....	118,262 86
Net earnings.....	\$194,768 61

Total passengers carried, 94,378; and total miles run, 170,506.

**THE OTHER ROADS.**—The gross earnings of the New York, Providence and Boston were \$1,065,650.31, and the operating expenses, \$561,375.62, making the net earnings \$504,274.69. Total passengers carried, 1,026,495; and total miles run, 641,353.

The gross earnings of the Shepaug road were \$62,931.83, and the operating expenses, \$54,393.83, making the net earnings \$8,538. Total passengers carried, 16,524; and total miles run, 9,930.

Gross earnings of the New London Northern, \$587,384.48, and total operating expenses, \$519,312.18, leaving a net earning of \$68,072.30. Total passengers carried, 420,066; and total miles run, 565,968.

Gross earnings of the Housatonic road, \$746,327.76, and operating expenses, \$567,200.58, making net earnings \$179,127.18. Total passengers carried, 340,478; and total miles run, 539,470.

Gross earnings of the Naugatuck road, \$714,898.01, and operating expenses, \$463,865.10, making net earnings \$251,032.91. Passengers carried, 415,391; miles run, 362,746.

Gross earnings of the New Canaan road, \$15,108.63; operating expenses, \$9,268.56; net earnings, \$5,840.07; passengers carried, 41,369; miles run, 18,240.

Gross earnings of the Danbury and Norwalk road, \$200,993.90; expenses, \$128,002.67; net

earnings, \$72,990.73; passengers carried, 346,784; miles run, 123,732.

The railroad companies contribute in taxation toward the expenses of the State, \$484,732.42. The insurance companies, including fire and life, foreign and domestic, \$342,331.98, and savings-banks, \$252,886.10.

These three great monetary interests pay in taxation more than five eighths of all the expenditures of the State.

The life and fire insurance companies are among the most prominent corporations of the State—some of them the largest and most prosperous in the world. The last report of the insurance department shows that the fire-companies had over \$23,000,000 of assets, and the life-companies over \$105,000,000.

The report of the Treasurer shows that the funded debt of the State, reduced by the payment of \$10,000 during the year, was, November 30, 1882, \$4,957,600.

It has cost for the education of the 121,185 children in the public schools for the last year, \$1,563,065.16; of this sum the State paid \$222,773.

In addition to the cost of public schools, the State expended for public education \$49,500 for the Normal School, \$5,000 for the Storrs Agricultural School, and \$8,388.03 for the Board of Education.

The largest item in the list of expenditures is for charitable, humane, and reformatory purposes. It amounts to over \$276,000. It includes the cost for care of 380 boys in the Reform School; 183 girls in the Industrial School; 1,079 insane persons in the hospital at Middletown, 28 in the retreat at Hartford, 24 in hospitals outside the State; 57 imbeciles in the school at Lakeville; 146 sick and wounded soldiers in hospitals; 100 soldiers' children in different towns; 18 blind persons at Boston; 51 deaf and dumb at Hartford, and 241 paupers at Tariffville.

The population of the State, by counties, in 1880 and in 1870, was as follows:

COUNTIES.	1880.	1870.
Fairfield .....	112,042	95,276
Hartford .....	125,882	109,007
Litchfield .....	52,044	45,737
Middlex .....	85,589	86,099
New Haven .....	156,528	121,257
New London .....	73,152	66,570
Tolland .....	24,112	22,000
Windham .....	43,856	38,518
The State.....	622,700	587,454

**POLITICAL CONVENTIONS.**—The Republican State Convention met at New Haven on September 20th, little less than five hundred delegates being in attendance, and nominated the following ticket:

For Governor, William H. Bulkeley, of Hartford; Lieutenant-Governor, John D. Candee, of Bridgeport; Secretary of State, Stiles T. Stanton, of Stonington; State Treasurer, Julius Converse, of Stafford Springs; State Comptroller, Frank D. Sloat, of New Haven.

The following is the text of the platform adopted:

The Republican party of Connecticut reaffirms its creed of all rights to all men; the preservation inviolate of each and every constitutional amendment; a free and fair ballot and the enactment and enforcement of appropriate legislation to preserve this right, upon which the integrity of our institutions rests; a tariff reduced and revised, not only for revenue, but also for the protection of American labor against the labor of the Old World; the abolition of useless offices; equal taxation and a rigid economy in all departments of the nation and the State; the protection of the rights and liberty of every American citizen at home and abroad; education under the fostering care of the General and State governments, which shall bring its advantages to the home of the humblest citizens; the purity of the ballot-box and its protection against intimidation, bribery, and corruption; appropriate legislation for the encouragement of commerce, the reduction of the burdens of taxation, State and national, and the limitation of expenditures to the necessities of the Government; a judicious system of civil-service reform, by which competent officers shall be secured for the public service—Federal, State, and municipal—and protected from assessment and removal except for cause.

The Republican party, as an earnest of its future, refers to the record of its past service, both in war and in peace—to the suppression of the rebellion, the abolition of slavery, the enfranchisement of a race, the resumption of specie payments, the preservation of the honor of the country, the payments of its debt, the universal prosperity at home and peace with all nations. It reveres the memories of its martyred Presidents—Lincoln and Garfield—and it cordially indorses and supports the administration of President Arthur, who, by his modesty, his capacity, and his fidelity to the interests of the people, and by the wisdom and courage of his public acts and utterances, has commended himself to the confidence and approval of his fellow-citizens without distinction of party. It believes that all just government derives its authority from the consent of the governed. It has confidence in the integrity and good sense of the people, and is not afraid to submit to them questions which vitally affect their prosperity and well-being. It therefore declares itself in favor of submitting to the people, at a special election to be held for the purpose, the amendment to the Constitution proposed at the last session of the General Assembly relative to the prohibition of the sale and manufacture of intoxicating liquors, and of enforcing by appropriate legislation whatever their will may be upon that question.

For the purpose of promoting economy and watchfulness in the expenditures of the State, we believe they should be regulated by a system of annual appropriations.

We declare for the encouragement of State industries; the support of the public schools; a limitation upon special and private legislation, and the passage of liberal general laws, under which all the citizens of the State shall have equal rights, and none shall enjoy exclusive privileges.

We declare that the growing influences of the great corporations of the country ought to be jealously watched; that the assumption of any undue power on their part should be promptly checked, and that the principle—that the people must control the corporations and not the corporations the people—should be vigorously maintained.

The Democrats, represented by nearly four hundred delegates from all sections of the State, convened at Hartford on October 4th, and nominated their candidates for the several public offices, as follows:

For Governor, Thomas M. Waller, of New London; Lieutenant-Governor, George G.

Sumner, of Hartford; Secretary of State, D. Ward Northrop, of Middletown; State Treasurer, Alfred K. Goodrich, of Vernon; State Comptroller, Thomas Sanford, of Redding.

The following platform was unanimously adopted:

*Whereas*, The Democratic party, originally organized in the early days of the republic to secure the administration of public affairs by those most loyal to our form of government as defined by the Constitution, and to the principle of the sovereignty of the people, upon which the Government is based, has always aimed to meet political issues as they have from time to time arisen in the spirit which actuated its founders, and to determine such issues by the test of their relations to the first and unchanging principles of the party;

*And whereas*, The great changes which have followed the civil war, and the rapid growth of the country in population and wealth, the dangerous and growing evils developed by years of partisan strife, without any clearly-marked differences of political conviction or definite object of administrative action; the immediate necessity of putting an end to vicious habits that are fast hardening into a permanent system, and of securing the selection of public officers and the administration of public affairs in accordance with the true underlying principles of our Government and the aroused conscience of the people, seeking expression in many ways, but in every way demanding a thorough clearing of the political atmosphere, and an honest and definite presentation of political principles, all require a restatement of Democratic principles as applicable to the condition of to-day and the political issues of the immediate future—the Democrats of Connecticut, in convention assembled, do declare:

*First*, The Constitution of the United States, with its amendments, is the supreme law, and defines a form of government which is peculiar to itself, the natural growth of our history, and is of all forms of government the best adapted both to the protection of life and property and the security of personal freedom. Under this form of government the exercise of sovereign power is not confined to any one agent, but is divided; the exercise of certain specified powers is intrusted to the Federal Government, and the exercise of all other powers is reserved to the States and to the people; to the existence of this Government the supreme authority of the Federal Government, within the limit of the powers to it confided, is absolutely essential, and equally essential is the independence of the several States and their unimpeded exercise of all powers not assigned to the General Government. The Constitution of the United States, together with the constitutions of the several States, defines the form of government for one people, constituting "an indestructible union of indestructible States." To this form of government we give our undivided support—a support rooted in the firm conviction of its absolute wisdom and strength—and to maintain and preserve the Government in its strength and purity we deem it necessary:

1. To give a hearty support to the vigorous action of the General Government in the wise exercise of all powers to it assigned. The supremacy of the General Government within the range of its powers is essential to the protection of the whole people and to the promotion of the general welfare.

2. To fearlessly maintain the independence of the States in the wise exercise of all powers not assigned to the General Government. Such independence contributes to the permanent strength of the whole Government, and is essential to the preservation of personal freedom.

3. To persistently oppose all strained interpretations of the power named in the Federal Constitution. The authority of the Federal Government being su-

preme within the limits of its action, strict construction of the powers assigned to it is absolutely essential to the permanent preservation of that division of the exercise of sovereign power between the local and the General Governments, which is the peculiar basis, the strength, and the glory of the American Republic.

*Second*, Our government is the result of the will of the people. Back of all laws and all forms stand as supreme sovereign the qualified voters. To this sovereign we owe allegiance; to honestly and fearlessly aid this sovereign in the wise administration of affairs is the highest duty of every citizen; to ascertain and establish the best methods by which this sovereign can govern a powerful, rich, and populous country is the great political problem now demanding solution. We believe in the sovereignty of the people; we believe that the absolute despotic power, which in every government must be vested in some man or body of men, is most wisely and safely intrusted to the qualified voters; and to maintain the sovereignty of the people, to secure its wise exercise, to preserve its purity, and to insure its permanency, we deem it necessary:

1. To hold and to encourage a firm and generous faith in the ability of the people to govern; in their intelligence, honesty, and patriotism, and inspired by such faith to speak to our own sovereign, honestly and truly appealing to his reason and conscience, not seeking to make him the slave of passion or the victim of deception.

2. All sovereigns must govern by agents. The people, as sovereign, must of necessity almost wholly govern by agents. The selection of these agents should be determined by laws, so framed that the selection may be made in accordance with a permanent system adapted to the rejection of the incompetent and the appointment of the most fit.

3. To protect the people in the direct exercise of power through the ballot, not only by providing more efficient guards against intimidation and fraud but by securing a true expression of the people's will when called upon to appoint by ballot any public agent.

*Third*, In pursuance of these principles, and applying them to the chief questions now at issue, we advocate:

1. Strict economy in the expenditure of public moneys, and the restriction of appropriations from the national Treasury to objects clearly of a national character.

2. A revision of the internal revenue law and of the tariff that shall reduce taxation, so that the revenue shall not exceed the present needs of the Government, and shall establish a tariff upon the only constitutional basis, the production of a revenue sufficient to meet expenses, giving incidental protection to industries that promote the general welfare, and no protection to mere monopolies.

3. Legislation appropriate to secure the abolition of all unnecessary offices, the clearing from the civil service of all retainers of politicians, and the future appointment of such persons only as shall have proved themselves most fit by tests of merit provided by law and open to the free competition of every citizen.

4. Legislation appropriate to secure a most careful selection of all public officers, both State and Federal, by providing an appointing power for each class of officers, with special reference to the duties to be performed.

5. Legislation appropriate to afford a more thorough protection against fraud in the use of the ballot, and to secure to the people when called upon to appoint any public officer by ballot the practical power as well as the right to express their preferences under the forms and protection of law.

*Fourth*, Willing to recognize in a political opponent any act worthy of commendation, we cordially approve the veto by President Arthur of the River and Harbor Bill. Following in the footsteps of the Democratic Presidents who have heretofore prevented such unconstitutional legislation by the exercise of

the veto power, he has aroused the wrath of his own party, who offered him the unprecedented insult of permitting the passage of a vetoed bill by a two-thirds vote while in full control of both Houses of Congress. We ask all citizens of this State opposed to such extra, unjust, and unconstitutional legislation, to unite with us in defeating the Republican party, which has so openly committed itself in support of the River and Harbor Bill, as well by the obstinate refusal of its late convention to approve the veto of the President, as by its renomination of the Congressmen who supported the bill and opposed the veto.

*Fifth.* The adoption of an amendment to the State Constitution is a most important exercise of the sovereign power vested in the people. The exercise of that power has been wisely guarded by requiring such amendment to be first approved by the House of Representatives; to be then published with the laws and submitted to the people; to be then approved by two thirds of each branch of the General Assembly, and then, and then only, to be submitted to the people for rejection or adoption. No member of the Legislature can vote to submit to the people a constitutional amendment of which he does not approve without violating his oath of office and destroying one of the safeguards which the people themselves have erected for the protection of the Constitution from sudden changes. We denounce the declaration of the Republican party platform favoring the submission to the people of a proposed amendment to the Constitution which it fails to approve, as evasive and cowardly. We fully recognize the evils arising from the abuse of intoxicating liquors. We believe the evils may be most effectually checked by the force of an enlightened public opinion; they may be partially restrained by wise legislation; but such legislation should not be so oppressive or impracticable in its provisions as to trench on the personal rights and liberties of citizens, and ought not to be made a partisan question. Legislation so equally affecting every one, in reference to a subject where all honest men seek a common object, can most safely be left to the individual conscience, free from the blindness of party prejudice. We believe the incorporation of a police regulation relative to the sale of intoxicating liquors into the State Constitution to be opposed to the plainest principles of sound government.

The Prohibitionists of Connecticut assembled in State Convention at Hartford in April, about forty delegates being in attendance. No platform was adopted nor reported, but the following State ticket was nominated:

For Governor, George P. Rogers, of New London; for Lieutenant-Governor, William S. Williams, of Glastonbury; for Secretary of State, F. H. Sage, of South Norwalk; for State Treasurer, Edward Tuttle, of Meriden; for State Comptroller, C. S. Harrington, of Middletown.

The Greenbackers nominated — Tanner for Governor, and — Phelps for member of Congress from the First District.

The election resulted in an almost entire victory to the Democratic nominees.

The aggregate votes polled for Governor throughout the State in 1882 were 16,598 less than in 1880, they having been 115,165; of which 59,180 were cast for Waller, Democrat; 54,526 for Bulkeley, Republican; 928 for Rogers, Prohibitionist; and 481 for Tanner, Greenbacker. In 1880 the entire vote for Governor was 132,763, distributed into 67,070 for Bigelow, Republican; 64,293 for Eaton, Democrat; 897 for Baldwin, Greenbacker; 488 for Rogers,

Prohibitionist. In regard to Congressmen, the Democratic nominees, Eaton, Mitchell, and Seymour, were elected from the First, Second, and Fourth Congressional Districts; the Republicans having re-elected their nominee, Wait, from the Third District. In the Senate there are Republicans 13, Democrats 11. In the Legislature of 1881 it stood, Republicans 17, Democrats 7. To the Lower House the Democrats elected 109 members, the Republicans 139. In 1881 the proportion of their respective numbers was 101 and 147. The Republican majority in the next General Assembly will be 30 in the House of Representatives, and 2 in the Senate.

COREA, a kingdom of Eastern Asia, occupying the peninsula opposite the Japanese island of Nippon and bordering on the Chinese province of Mantchooria. The King of Corea acknowledges the nominal suzerainty of China, but has for ages preserved a practical independence. The Chinese have assisted the Coreans in their wars with the Japanese, who conquered the country in the third century of the Christian era, and have repeatedly overrun it since, claiming tribute and submission down to the present time. The Coreans are a Mongolian race (the Fuyus, who founded the Japanese Empire), grafted on another stock which shows evidence of Aryan origin. For nearly three hundred years the Coreans, taught by the terrors of invasions from the Japanese on the one side and the Mantchoos on the other, have followed a policy of complete non-intercourse with foreigners.

OPENING OF TREATY PORTS.—Within the last ten years, influenced by the pressure of the Chinese and Japanese Governments, they have commenced to open their gates. The urgency of China and Japan and the complacency of the Coreans is partly explained by the dread of Russian annexation, and the desire to have friends among the Western nations interested. In 1876 Japan, in consideration of abandoning her traditional claim to tribute, obtained a treaty conceding certain commercial privileges. The garrison town of Fusan, which the Japanese had held for centuries on the peninsula, was transformed into a trading-station. Japan also obtained the right of trading in the sea-port of Gensan, on the northeastern coast, and in 1880, in the port of Incheuin on the western coast, twenty-five miles from the capital, Seoul. The last concession precipitated a conflict between the reactionary party in Corea, headed by Tai-wen-Kun, the father of the King and late Regent, and the progressive party, represented by the young King and Queen. The progressive party was divided between the friends of Japan and those partial to China. The Japanese military system was introduced by the Japanese faction. Commodore Shufeldt, working with the American Minister at Peking, and aided by the influence of Li-Hung-Chang and the Chinese Government, obtained through the Chinese party a treaty, signed in June,

1882, by which Corea was thrown open to American commerce. A similar convention was signed with China on the same day.

**INSURRECTION.**—Four days afterward an outbreak of the conservative elements resulted in the massacre of the Queen, the heir-apparent and his bride, and the ministers, thirteen in number, who were in favor of foreign intercourse. The Japanese legation was attacked, but escaped to another town, and thence to a British man-of-war. Although the Japanese had no reason to favor the concessions made to China and the United States, and had no hand in the proceedings, they were visited with the special wrath of the Corean mob, and only escaped a wholesale slaughter by flight. Within a month the Japanese envoy re-entered Seoul with a military escort. The people and Government of Japan were greatly incensed and made immediate preparations for war, but the matter was compounded by the payment of a heavy indemnity. The usurping rebel surrendered on the arrival of a Chinese force of three or four thousand men, which the Chinese envoy led into Seoul simultaneously with the return of the Japanese ambassador, and he was taken a prisoner to Tientsin, and the King restored to full authority.

**THE AMERICAN TREATY.**—Great Britain and Germany hastened to conclude similar arrangements with Corea as those secured by the American plenipotentiary. France negotiated for a treaty, but insisted on the condition that French missionaries should have the liberty to teach, which the Coreans refused to grant. French Jesuit missionaries have for centuries been the only foreigners who could obtain access to Corea. Their propaganda was forbidden. Yet at times it was secretly protected by the influential converts whom they gained. At other times they have been rigorously dealt with, and on more than one occasion suffered martyrdom. The ex-Regent, who headed the insurrection in July, attempted to extirpate Christianity in 1864, slaughtering the native Christians and putting nine Jesuit missionaries to the sword.

The American treaty was framed under the inspiration of the Chinese authorities, and embodies those liberal principles which the Chinese have endeavored to introduce in their treaty arrangements, and which it has recently been the policy of the United States Government to promote. The aim of the Chinese is to escape from the harsh and humiliating conditions which Great Britain imposed upon them after the last opium-war, and which are now maintained to be the proper bases of treaty arrangements with Oriental powers. The treaty introduces China by stating that the President of the United States admits that Corea has always been tributary to China, "but the treaty shall be permanently regarded as having nothing to do with this." The restriction of the amount of customs duties which China is allowed to levy is relaxed; the limi-

tations in the Corean treaties, instead of being fixed at 5 per cent *ad valorem*, as in the Chinese, vary from 11 per cent on necessities to 30 per cent on luxuries. The Coreans are also allowed to charge higher tonnage dues than the Chinese. Four ports are opened to the commerce of the treaty nations, but strangers are prohibited from traveling in the interior. The importation of opium is strictly prohibited. Foreigners are not permitted to engage in the coasting-trade. The export of grain may be interdicted in times of scarcity. There is a clause providing that diplomatic correspondence shall be carried on between the contracting parties in the Chinese language. The right of extra-territoriality is qualified by a provision that "if in the future the Corean Government shall bring the laws and legal procedure of Corea into harmony with those prevailing in the United States, the power now granted to consuls of the United States to act judicially shall be withdrawn, and American citizens living within the boundaries of Corea transferred to the full jurisdiction of the native local authorities." The favored-nation clause is also modified by the proviso which was introduced in the Chinese-German treaty of 1880, and in the more recent one concluded with Brazil. In the Corean treaty the clause runs: "But all special concessions made to the most favored nation shall be explained and made public, so that the contracting party may know that such concessions have been made to the favored nations under special conditions."

**COSTA RICA (REPÚBLICA DE COSTA RICA).** For particulars relating to territorial division, population, etc., reference may be made to the "Annual Cyclopædia" for 1877.

The President of the Republic is General Próspero Fernandez (entered office on August 10, 1882); the Vice-President is General Pedro Quirós; and the Cabinet (at the end of 1882) was composed of the following Ministers: Interior and Justice, General Victor Guardia; Foreign Affairs and Public Instruction, Señor José María Castro; Finance and (*ad interim*) War and Marine, Señor Bernardo Soto.

On the death of General Tomás Guardia, which occurred on July 6, 1882, Minister Lizano, as First Designate, assumed the executive power provisionally. The decease of General Guardia, who had for so many years been in name the President, but in fact the Dictator, of Costa Rica, provoked a marked exhibition of public excitement; but the peaceful change of government which ensued proved that his long permanence in power had been effectual in crushing out the spirit of civil strife.

The Bishop of Costa Rica is the Right Rev. Bernardo A. Thiel.

The Costarican Minister to the United States is Señor Manuel M. Peralta; and the Consul-General of Costa Rica at New York is Señor José M. Muñoz.

The United States Minister (resident in Guatemala, and accredited to the five Central

American Republics—Guatemala, Honduras, Nicaragua, Salvador, and Costa Rica) is Mr. H. C. Hall.

The military force of the country consists of the standing army, nominally 500 strong, and the militia, comprising all male citizens between the ages of eighteen and fifty-five, the reserves being made up of men between thirty and fifty-five. The number susceptible to be called upon to carry arms was reported at 16,370 in 1879.

**STATISTICS.**—The financial condition of Costa Rica, once so flourishing, would seem to grow more and more unsatisfactory each successive year, and this is attributed mainly to the persistent maintenance, during the Guardia administration, of a ponderous and costly government machinery alike incommensurate with the requirements and possibilities of the country, and an ever-increasing home debt accruing from successive loans the proceeds of which have been applied in part to cover deficits, while the remainder has been wasted in unproductive public works. The revenue for the fiscal year ending April 30, 1880, as given in the "Annual Cyclopædia" for that year, was \$2,802,279, and the expenditure \$3,460,597, leaving a deficit of \$658,318. In an official statement issuing from the finance department, and bearing date of October 17, 1882, the expenditure for the *nine months* immediately ensuing was estimated at \$3,271,518, to be distributed as follows:

Interior.....	\$166,874 50
Police.....	50,546 00
Public Works.....	312,207 63
Justice.....	106,786 00
Worship and Charities.....	23,150 59
War and Marine.....	878,792 55
Finance.....	2,012,646 65
Foreign Affairs.....	42,505 00
Public Instruction.....	174,190 00
Additional.....	4,815 00
Total.....	\$3,271,518 97

Now, the revenue for that period of nine months, if in the same proportion as for the year ending April 30, 1880, would be but \$1,101,710, and the resulting deficit would be \$2,169,803.97, or nearly double the amount of the revenue. To lighten the burden of such an onerous deficit, however, the Executive, duly authorized by the Congress, issued a decree on October 18, 1882, ordering a reduction of 10 per cent of the salaries of all persons employed or pensioned by the Government and paid out of the public funds. Yet, even after deducting 10 per cent from the total estimated expenditure (in which, of course, are included many outlays other than salaries), as shown in the foregoing table, the deficit would still exceed the income by \$740,942.

The foreign debt of Costa Rica stood as fol-

lows at the end of 1882, according to the report of the bondholders' committee:

Principal of 6 per cent loan.....	\$291,200	
Interest on 6 per cent loan.....	508,248	
		\$1,449,448
Principal of 7 per cent loan.....	\$1,460,100	
Interest on 7 per cent loan.....	970,966	
		2,481,066
Total foreign debt.....		\$3,880,514

This amount, even at an exchange of 10 per cent, would give the sum of \$21,342,827. Payment of the 6 per cents is guaranteed out of the national revenue, the proceeds of sales of

SAN JOSÉ, THE CAPITAL OF COSTA RICA.

state property, and the customs receipts; and the 7 per cents were to be paid from the proceeds of the tobacco and spirit monopolies, the export duty on coffee, and the profits on local railway traffic. "In return for this heavy indebtedness," says a native writer, "we have three sections of railway, of the estimated value of £1,200,000," or say \$6,600,000, calculating exchange at 10 per cent.

The precise amount of the home debt it would be difficult to determine, in the absence of official returns; but with expenditures aggregating \$28,541,000 for the decade 1871-'80, against an aggregate revenue of only \$24,920,400, the country must owe at least \$3,620,400 on that score. "Thus we prove that there is a crisis," adds the writer already quoted, "and this crisis the empirics would cure by issuing paper money, which would at once lead to the withdrawal of all specie from circulation; violent fluctuations in exchange, and the consequent immediate depreciation in the value of the new currency; the employment of this last in risky and unproductive speculations; the imposition of an immense tax on future revenues; and the immediate discredit of the Government which issues that paper money."

President Fernandez is said to share with his Cabinet ministers in the conviction that the country's salvation depends upon the completion of the railway and the equitable settlement of the national debt. The bondholders have been informed that it is useless to expect

payment from Costa Rica until the railway is finished. This will require at least two years, and an additional expenditure of about one million pounds sterling, to which the republic declares its total inability to contribute anything. Hopes were entertained of the possibility of raising the funds before long.

Arrangements were made for the extinction of the home debt, the different banks dividing the negotiation between them. A balance was to be struck, and the amount due would then be paid by the Government in \$100 bonds, which would be canceled by the Anglo and Union Banks by quarterly drawings in which the amount would be employed as a redemption fund, which might have been received in notes in the custom-house. Notes receivable in the custom-house were to be issued to the full amount of the debt. The banks were to issue notes in consideration of a commission of one per cent, and agreed to redeem the bonds as aforesaid with the notes received from the custom-house. These measures, however, do not appear to have proved successful. On December 4th there was a panic in San José, and all who held bonds, notes, or drafts, commenced trading them off in the hope of saving some portion of the capital invested. At the doors of the banks crowds gathered to effect transfers in the streets, and notes of the National Bank were sold at 25 per cent discount. Public confidence was afterward partially restored; but the extreme measures resorted to by the Government had evidently produced an injurious rather than a salutary effect, and there was little likelihood that the crisis would soon subside.

Concerning the foreign commerce of the republic, no later statistics have been published than those given in the volume of the "Annual Cyclopædia" for 1880.

The branches of the railway so far in operation are those from Alajuela to Cartago, *via* Heredia and the capital (27 miles); from Puntarenas, on the Pacific coast, to Barranca (9 miles); and from Limon, on the Atlantic coast, to Rio Suizo (71 miles): total, 107 miles.

The telegraph lines are of the aggregate length of 454 miles, with 16 offices, and, establishing communication between the ports of Puntarenas and Limon, and the principal cities of the interior, extend to the frontier of Nicaragua.

For interesting details concerning public education, reference may be made to the "Annual Cyclopædia" for 1879. The establishment of normal schools in each of the provinces was decreed in October, 1882.

The cordial relations of the republic with the neighboring states were maintained unbroken throughout the year.

**COTTON - CROP OF THE UNITED STATES, AND ITS SPECIFIC MANUFACTURES.** The cotton-crop of 1880, as returned by the census, amounted to 5,746,414 bales. This was an average of 0.40 bale per acre of the land

planted. This crop was gathered from thirteen States and the Indian Territory, and the yield of each was as follows:

STATES.	Acres.	Bales.	Bales per acre.
Alabama .....	2,380,086	699,654	0.30
Arkansas .....	1,042,976	608,256	0.58
Florida .....	245,595	54,997	0.22

Under the term *specific* cotton manufactures are included establishments which work cotton into a fabric known and sold under that name. The spindles mentioned are those making yarn for mixed goods, and spindles appurtenant to looms upon which cotton is woven into cloth.

The returns of the *specific* manufacture of cotton-yarn and woven fabrics, including some cotton hosiery, are as follows:

Number of spindles .....	10,653,495
Number of looms .....	225,759
Bales of cotton consumed .....	1,670,344
Number of persons employed, exclusive of administration, as overseers, operatives, watchmen, mechanics, yard-hands, or laborers .....	172,544
Sum of wages paid, in the census year, to these persons .....	\$42,040,510

To the cotton consumed there should be added an amount for woolen-mills, for upholstery, increased amount consumed in the cotton year over the census year, and the total is 1,740,773 bales. The statement of the New Orleans Exchange is 1,705,334, and that of the New York Financial Chronicle 1,760,000.

In the consideration of the following data it will be observed—

1. That the capital employed is the sum of the estimates of the several owners or managers of the value of their mills and machinery, or what is known as the *plant*; these estimates vary greatly in respect to individual cases and to sections.

2. The spindles given are the producing spindles, not including doubling or twisting spindles.

3. The number of operatives is assumed to be the average number employed for a full year, as that was the intention of the questions framed. It will be observed that the average of the whole country in specific cotton-mills is a fraction over sixteen to each thousand spindles, being less in fine mills, more in coarse mills.

The horse-power available for this work, as returned by owners or managers, appears to be:

Water-power .....	183,813
Steam-power .....	119,265
Total .....	257,568

which would be at the rate of more than twenty-four horse-power to the 1,000 spindles. This is more than the power actually used, probably by one third.

CRIMINAL JURISDICTION IN THE UNITED STATES. An effort was made, in the preparation of the census of 1880, to procure such information as would show the system of courts of criminal jurisdiction established in the several States, and for the United States.

UNITED STATES COURTS.—The Supreme Court consists of nine judges, who are nominated by the President and confirmed by the Senate. They hold their office during good behavior, and can be removed by impeachment. Their names, and that of the State from which each was appointed, were as follows in 1880: *Chief Justice*—Morrison R. Waite, of Ohio. *Associate Justices*—Horace Gray, of Massachusetts; Noah H. Swayne, of Ohio; Samuel F. Miller, of Iowa; Stephen J. Field, of California; William B. Woods, of Georgia; Joseph P. Bradley, of New Jersey; Ward Hunt, of New York; and John M. Harlan, of Kentucky. The States are divided into fifty-nine districts, in each of which, with four exceptions, a circuit court is also held; and each justice is required to sit as a circuit justice at least one term in two years. There is also a Supreme Court of the District of Columbia, and also of each of the Territories. Of the former there are six judges, and of the latter twenty-five judges. In addition, there are nineteen hundred and thirteen

commissioners appointed by the circuit courts. These issue warrants, make preliminary examinations, and commit or hold to bail offenders against the United States. State magistrates also have power to arrest, commit, or hold to bail, offenders against the United States. As there are no United States circuit or district courts in the Territories, the functions of these courts are exercised by the Supreme Courts of the Territories.

STATE COURTS.—The State courts embraced in the returns are those which have original or appellate criminal jurisdiction. Original criminal jurisdiction is not possessed by certain courts, except the power to issue writs. This is generally the case with the courts of last resort, known in most States as the Supreme Court (but in Alabama, Kentucky, Maryland, New York, and Texas, as the Court of Appeals; in Connecticut, as the Supreme Court of Errors; in Maine and Massachusetts, as the Supreme Judicial Court; in New Jersey, as the Court of Errors and Appeals; and in West Virginia, as the Supreme Court of Appeals).

In a number of States, judges of the highest court are *ex-officio* judges also of some court of inferior jurisdiction: as the Superior Court, in Connecticut; the Courts of Oyer and Terminer and of General Sessions, in Delaware; the Court of Oyer and Terminer, in New York.

the District Court, in Ohio; the Supreme Court, in New Jersey; the Court of Oyer and Terminer, in Pennsylvania; the Court of Common Pleas, in Rhode Island; and the County Court, in Vermont. The Maryland Court of Appeals is composed of the circuit judges, sitting in banc.

In Massachusetts original criminal jurisdiction (but in capital cases only) has been conferred upon the Supreme Judicial Court. In Maine, New Hampshire, and Rhode Island, the supreme judges hold trial terms in the several counties for the trial of all felonies and misdemeanors, but the court sits in banc for the hearing of appeals.

In capital cases, the jurisdiction of the Supreme Judicial Court in Massachusetts is exclusive. Exclusive jurisdiction in capital cases is exercised also by the Courts of Oyer and Terminer in Delaware, New Jersey, and New York, and by the Circuit Court in Virginia.

In three States special courts have been organized for the trial of all felonies (of which class of offenses they have exclusive jurisdiction), namely, the Circuit Court in Arkansas, the Superior Court in Georgia, and the District Court in Texas.

But in the majority of States the same court which has jurisdiction of felonies has jurisdiction of misdemeanors also, either of all misdemeanors—as in Alabama, Delaware, Illinois, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Missouri, New Hampshire, New York, Pennsylvania, South Carolina, Vermont, Virginia, West Virginia, and Wisconsin—or of misdemeanors not cognizable by inferior courts, as the case may be—as in California, Colorado, Connecticut, Florida, Maine, Michigan, Minnesota, Mississippi, Nebraska, Nevada, New Jersey, North Carolina, Ohio, Oregon, Rhode Island, and Tennessee. These courts of general criminal jurisdiction are known by various titles: usually as circuit or district courts, but sometimes as superior courts, or courts of sessions, or courts of oyer and terminer, or of common pleas. Their character is for the most part similar. Their territorial jurisdiction is commonly (but not always) bounded by the limits of the county in which the term is held. In Vermont and in Virginia they are called county courts.

In many States an inferior grade of courts exists, with jurisdiction of misdemeanors only. Such are the county courts of Alabama, Georgia, Illinois, Oregon, and Texas; also the District Court in Massachusetts, the Inferior Court in North Carolina, the Probate Court in Ohio, and the Quarter Sessions in Pennsylvania. In Arkansas, Mississippi, and Missouri, justices of the peace have jurisdiction of all misdemeanors.

There is a class of courts found only in localities which either possess concurrent jurisdiction with some of the courts already named, or replace them within certain defined territorial limits, e. g., in a city, county, or district.

To the first of the two subdivisions indicated belong the City Courts of Mobile, Montgomery, and Selma, in Alabama; the City Courts of Atlanta, Gainesville, and Savannah, in Georgia; the Criminal Court of Cook County and the City Courts of Alton, Aurora, East St. Louis, and Elgin, in Illinois; the Superior Court of Kennebec County, in Maine; the Superior Court of Grand Rapids, in Michigan; the Court of General Sessions in the city of New York, the City Court of Brooklyn, the Superior Court of the city of Buffalo, and the Courts of Special Sessions for the cities of New York and Albany, in the State of New York; the Criminal Court of New Hanover County, in North Carolina; the Special Criminal Courts in the counties of Davidson and Rutherford (forming one circuit), Knox, Montgomery, Shelby, and Madison, in Tennessee; the City Court of Burlington, and the Municipal Court of Rutland, in Vermont; and the Municipal Courts of Dane and Milwaukee Counties, in Wisconsin. To the second subdivision (jurisdiction exclusive) belong the "Criminal Circuit" Courts of Indiana; the Criminal Court for the counties of Canton, Campbell, Harrison, Bracken, and Pendleton, in Kentucky; the Criminal District Court for the parish of Orleans, in Louisiana; the Superior Court of Cumberland, in Maine; the Criminal Court of Baltimore, in Maryland; the Criminal Court of Jackson County, the Criminal Court of the Sixth Judicial Circuit, the Moberly Court of Common Pleas, and the St. Louis Criminal Court, in Missouri; and the Corporation or "Hustings" Courts, in Virginia. It may be presumed, however, that even where the jurisdiction is concurrent, it is practically exercised (except, perhaps, in cases of the very first importance) by the local rather than by the general court.

The trial jurisdiction of justices of the peace is ordinarily limited to misdemeanors of a low grade. Arkansas, Mississippi, and Missouri, as stated above, are exceptions. But in Georgia, Louisiana, Maine, Massachusetts, and Rhode Island, justices have no trial jurisdiction. In Maine and Massachusetts certain justices (designated by the Governor and specially commissioned) are vested with trial jurisdiction and entitled "trial justices." In Rhode Island one justice in each town (chosen in some cases by the Legislature and in others by the town council) acts as trial justice, and his court is known as a "justice court." In New York justices have no trial jurisdiction as such; but they may try certain offenses in their capacity as courts of special sessions. In Ohio the jurisdiction of justices is limited to violations of city or village ordinances. In the remaining States the class of misdemeanors of which justices have jurisdiction is defined in the statutes either by a list of the offenses triable in justices' courts, or by prescribing the maximum penalty which they are authorized to impose. This maximum is, of course, arbitrary, and varies greatly, the lowest being in Connecticut (seven

dollars, or thirty days), and the highest in Kansas (five hundred dollars, or one year). In Nevada justices try not only misdemeanors, but also violations of corporation ordinances.

A somewhat remarkable feature in the jurisprudence of Maine is the power conferred upon justices of the peace to issue writs of *habeas corpus* in certain cases—a provision not found in the penal code of any other State, except in South Carolina, where two trial justices, acting jointly, may issue writs of *habeas corpus* in like manner and with like effect as judges of any court of record.

The trial of violations of corporation ordinances is intrusted in some States to police justices; in others to police courts, mayor's courts, or recorder's courts, created either under a general law or by special act.

The survival of usages derived from the English system of practice in criminal proceedings is noticeable in several States, particularly in the maintenance of the distinction between the Court of Oyer and Terminer and the Court of General Quarter Sessions, in New Jersey (where the justices of the Supreme Court and of the Court of Common Pleas are *ex-officio* judges of both courts); and of the distinction between the Supreme Court and the Court of Common Pleas in Rhode Island (whose jurisdiction is concurrent, except in Providence County, and the Supreme judges are *ex-officio* judges of Common Pleas). In Delaware the same body of judges constitute the bench, not only of the Superior Court, but also of the Court of Oyer and Terminer and of the Court of General Sessions.

**APPELLATE JURISDICTION.**—There are some striking departures from the ordinary system of appeals from the decisions of inferior courts. In Delaware, an appeal may be taken in a bastardy case directly from a justice of the peace to the Superior Court, which is the court of last resort; but the decisions of the Courts of General Sessions and of Oyer and Terminer, in criminal cases, are final. The peculiar organization of the bench of the Delaware courts has the effect of depriving a convicted prisoner of the right of appeal.

In Colorado, an appeal may be taken from a justice of the peace to the County Court, which has no original criminal jurisdiction, but no appeal lies from the County Court to any other.

In New York and New Jersey, a court known as the Supreme Court is interposed between the inferior courts and the Court of Appeals. Theoretically, the Supreme Court has original criminal jurisdiction; but, practically, it does not exercise it. An appeal lies from its decision to the Court of Appeals. The system of appellate courts in Illinois is somewhat similar; but these courts have no original jurisdiction, criminal or civil. There is a system of district courts in Ohio. The occasion for the creation of these special courts of appellate jurisdiction probably was a desire to relieve the

dockets of the courts of ultimate resort in the States where they exist.

In Texas, the Court of Appeals is the court of last resort in criminal proceedings only; the Supreme Court enjoys the ultimate jurisdiction in civil cases.

**INVESTITURE OF JUDGES.**—There are three modes of investing a judge with the authority pertaining to his office: 1. Election by the people; 2. Election by the representatives of the people; and, 3. Appointment by the Executive.

In one-half the States of the Union the first is the only mode in use; and in seven others a marked preference for this mode is manifested.

Delaware, Maine, Massachusetts, and New Hampshire are the only States in which investiture by appointment is the mode exclusively practiced; but in New Jersey all judges are appointed, except justices of the peace; in Florida, all except mayors; and in Mississippi, all except mayors and justices.

The intermediate method (investiture through election by the Legislature) appears to have the preference in the States of Rhode Island, South Carolina, and Virginia.

In Connecticut and Georgia, a mixed system prevails.

Where appointments are made by the Governor, they are in some States subject to confirmation by the Senate, and in others not. In New Hampshire they must receive the unanimous approval of the Governor's Council, who also sign the judges' commissions.

**TENURE OF OFFICE.**—In Massachusetts, all judges above the grade of trial justices, including even the judges of police courts, are appointed for life. The only other life tenures are those of the judges of the Superior Court in Delaware, and of the Supreme judges in Florida, New Hampshire, and Rhode Island.

The tenure of office of other judges, above the grade of justice of the peace, varies from two to twenty-one years, the longest term being that of the judges of the Supreme Court of Pennsylvania. In the majority of cases it is four or six years.

Justices of the peace are usually elected or appointed for from two to four years; but longer terms are provided in New Hampshire, New Jersey, and Pennsylvania (five years each), in Tennessee (six years), in Delaware, Maine, and Massachusetts (seven years each), and in Florida (eight years).

**REMOVAL FROM OFFICE.**—A judge may be removed from office either by impeachment, by the act of the Governor (whether at his discretion or on address of both Houses of the Legislature), by joint resolution of the legislative body, by the action of a court, or on conviction of crime or of misfeasance or malfeasance in office. Instances of all these modes of removal occur. In some cases no mode of removal is prescribed in the statutes, but it is probable that indictment and conviction would,

in the absence of statutory provision, vacate the seat of any judge upon the bench.

**INITIAL PROCEEDINGS IN CRIMINAL CASES.**—Criminal proceedings may be initiated either by presentment, indictment, information, or sworn complaint.

Prosecutions in inferior courts are usually commenced by complaint; but in some States they may also be begun by information. Indictments may be brought in the police courts of Kentucky, the recorder's courts in New York, the "inferior" courts of North Carolina, and the county courts of Oregon and West Virginia. Indictments may sometimes be brought in a superior court and certified to an inferior, as in Georgia, Illinois, and Texas. In Texas the district court may certify an indictment for trial to a justice of the peace.

In the higher courts the common mode of commencing prosecutions is by indictment; but the State of Wisconsin has abolished the grand-jury system, and substituted proceedings by information or complaint instead of it. In fourteen States proceedings may be commenced either by indictment or information; in several of these the statutes require an indictment in case of a felony or other crime of high grade. In North Carolina, proceedings may be begun by sworn complaint.

The initiation of proceedings by presentment is peculiar to Nevada, Pennsylvania, and Virginia. The statutes of Pennsylvania provide that this mode shall not be adopted in the case of offenses of low grade where the remedy by indictment is adequate and no urgent necessity exists. In Virginia, presentments may

be made even in the county and corporation courts.

**MODE OF TRIAL.**—The mode of trial in all higher courts is by jury.

In certain States no provision appears to have been made by statute for the impaneling of a jury in inferior courts. In others, a jury is summoned only on demand of the accused. Some States have a system by which, in certain courts of minor jurisdiction, trial must be by jury; in others it may be, and in others it can not be, but must be by the court.

**SPECIAL PROVISIONS TO INSURE SPEEDY TRIAL.**—In several States provision has been made for granting to offenders who are willing to plead guilty, or to waive indictment and jury trial, a speedy hearing of the charges against them.

In Colorado, any misdemeanor may appear before a justice and plead guilty.

The same is true in New Hampshire, except that the justice can not receive a plea of guilty in cases where the maximum penalty exceeds a fine of one hundred dollars.

In New Jersey, the court of Special Quarter Sessions (which is in effect a special term of the Court of General Quarter Sessions) may be convened for the trial of alleged offenders who demand a speedy trial and waive indictment and trial by jury.

In Wisconsin, the county judge of each county, in his capacity as an individual magistrate, may receive a plea of guilty, at the request of an offender actually in custody, in any case where the maximum penalty for the offense charged does not exceed five years in the penitentiary.

## D

**DANA, RICHARD HENRY, LL. D.**, an American jurist and author, born in Cambridge, Mass., August 1, 1815; died in Rome, Italy, January 7, 1882. He was son of Richard Henry Dana, the poet and essayist (who died in his ninety-second year), and grandson of Chief-Justice Francis Dana. His early education was received in his native town, and he entered Harvard College in 1832; but, owing to over-devotion to work, and some trouble with his eyes, he was compelled to suspend his studies for a time. His physician having prescribed entire respite from intellectual labor, young Dana resolved to try the benefit of a sea-voyage. He accordingly shipped at Boston as a common sailor, on board a vessel which was bound to California by way of Cape Horn. The remedy proved to be admirably adapted to his case: he fully performed all the duties of the station he had assumed; he recovered his health entirely; and, on his return, wrote a narrative of his experiences and adventures, under the title of "Two Years before the Mast" (1840). This work has been pronounced by universal consent to be the

best and truest picture of sea-life ever written. Resuming his college work, Dana graduated at Harvard in 1837, studied law under Judge Story, and was admitted to the bar in 1840. His career as a jurist and public man was distinguished by qualities of high excellence. He was an eloquent speaker and clear and cogent reasoner, and he was frequently engaged in cases of great importance; such as the legal right to read the Bible in the public schools in Maine; the defense of the slave Shadrach, and subsequently (1854) the more exciting defense of Anthony Burns, another slave; the prize cases for the Government before the Supreme Court, arguing (successfully) the right of the President of the United States to use war powers for the national defense, etc. In 1853 he was a member of the Massachusetts Constitutional Convention, and in politics was one of the founders of the "Free-Soil" party, and an ardent supporter of Lincoln and Grant as Presidents of the United States. In 1859-'60 he made a tour of the world, revisiting California, and visiting China, Japan, Egypt, and returning by way of Europe. In 1861 he

was appointed United States District Attorney for Massachusetts, but resigned in 1865, in consequence of not being in accord with Andrew Johnson and his course in the presidential office. Harvard College conferred upon him, in 1866, the degree of LL. D. He was a member of the Massachusetts Legislature in 1867-'68, but failed of election to Congress, against Ben Butler, in 1868. President Grant nominated him Minister to England, in place of Mr. Schenck, in 1876, but the Senate refused confirmation. The latter years of his life were spent in Europe, in investigating the subject of international law, with the intention of preparing and publishing a treatise on that important branch of legal knowledge.

Mr. Dana was an able writer as well as learned jurist and statesman. Besides his first work (noted above), his chief publications were as follows: "The Seaman's Friend, containing a Treatise on Practical Seamanship (with Plates), a Dictionary of Sea-Terms, Customs, and Usages of the Merchant Service" (1841); a new and revised edition of Washington Allston's "Lectures on Art, and Poems" (1850); "To Cuba and Back," a volume of travels (1859); a new edition, with continuation, of Wheaton's "Elements of International Law" (1866), which excited some unpleasant controversy; "Oration on the Life and Character of Edward Everett" (1865); and "Oration on Lexington Common, at the Centennial Anniversary of the Battle of Lexington" (1875). In addition, Mr. Dana was a contributor to the "North American Review," and wrote frequently for the pages of the "Law Reporter" and the "American Law Review." He delivered a course of Lowell Lectures, was author of numerous speeches, addresses on political and other topics, etc. He was an earnest and active member of the Protestant Episcopal Church, and served faithfully for many years as one of its most efficient laymen.

DARWIN, CHARLES ROBERT. This English naturalist, distinguished as the expounder of the development theory of the organic world, died at the home where he had resided for forty years, Down House, in the village of Down, near Orpington, England, on the 19th of April. He had suffered for some time from weakness of the heart, but was able to do a little experimental work until he was finally prostrated, the day before his death. Charles Darwin, as he usually wrote his name, was born February 12, 1809, at Shrewsbury, where his father was a practicing physician. Robert Waring Darwin, his father, was the third son by his first marriage of Erasmus Darwin, the author of "The Botanic Garden," and was celebrated for the boldness of his speculative views, some of which foreshadowed the famous doctrine of which his grandson became the teacher. Charles Darwin's father was also a thinker in science, and was chosen a Fellow of the Royal Society, but he gave his main attention to his profession. On his mother's side, also, the author of the

theory of descent was descended from a man of original genius, his other grandfather being Josiah Wedgwood, the famous amateur artist in pottery.

Charles Darwin went at the age of sixteen from the grammar-school at Shrewsbury—presided over by Dr. Samuel Butler, author of a text-book of geography, and afterward Bishop of Lichfield—to Edinburgh University. He left there after two years for Christ College, Cambridge, where he took his bachelor's degree in 1831. At Edinburgh he gave some attention to marine zoölogy, and before he left he read two short papers before the Plinian Society, the subject of the first being the movement of the ova of *Flustra*. He is known to have been fond of the sport of fox-hunting in his youth. At Cambridge he was greatly interested in the study of botany.

In 1831 Captain Fitzroy, of the ship *Beagle*, who had just returned from South America, and was commissioned to continue his explorations in a surveying voyage round the world, offered to take with him a naturalist. Darwin volunteered to serve without pay, on the condition that he should have the disposal of the collections, and was accepted. The voyage lasted from December, 1831, to October, 1836. They circumnavigated the globe, visiting Brazil, Patagonia, Chili, Peru, the Galapagos and Society Isles, New Zealand, Australia, Mauritius, St. Helena, and the Cape Verd Islands. No scientist had received more favorable opportunities for original work than fell to the lot of the unknown young naturalist of the *Beagle*; but no corps of scientists on subsequent exploring expeditions have amassed a more copious store of observations than he did single-handed, or have by their combined thought derived from them so many profound and original conclusions. To the reports of the expedition published by Captains Fitzroy and King, Darwin contributed a volume entitled "A Journal of Researches into the Geology and Natural History of the Various Countries visited by H. M. Ship *Beagle*," which was republished separately in 1845. The zoölogical results of the cruise were worked up by him, with Professor Owen and Messrs. Waterhouse, Jenyns, Gould, and Bell as contributing specialists, and published before the narrative in 1840, as was the treatise on the "Structure and Distribution of Coral Reefs" (1842). Two other original treatises, embodying further fruits of his geological observations, were subsequently published, and took rank among the classics of that science—a volume on the "Volcanic Islands visited during the Voyage of the *Beagle*" (1844), and "Geological Observations in South America" (1846). Other memoirs, based upon the opulent store of observations gathered by Darwin, are incorporated in the "Transactions" of the Geological Society, the first in the volume for 1838, and further results are recorded in various papers on botany and entomology. He read a paper before the

Geological Society in 1837, just a year after his return, on the subject of the "Formation of Vegetable Mold," in which he broached a theory that illustrates his singular genius for understanding the processes of nature. The observations on which the theory was founded were begun some time before. He arranged then for experiments which took forty years to mature. The results of these experiments, and the final elaboration of his theory of vegetable mold, were given in the latest work of his life, the volume on "Earthworms," the import of which was given in the "Annual Cyclopædia" for 1881. The discovery of the important relation of the habits of the earthworm to the sustenance of all terrestrial life, like that of the geological significance of the coral zoophyte, exemplifies the originality of Darwin's mind. He was a solitary worker, with his mind bent singly upon the book of nature. No scientific discoverer has owed less to his book-learning, to the premonitions and suggestions of other workers in the same field. His character, too, was elevated above the ambitions, jealousies, and controversial propensities of the ordinary man of science. He struck out new paths of investigation, and the truths which he came upon made less stir than if he had discovered the key to problems for which many were searching. He had so little of the hackneyed ways of the professional scientist that the mass of good work which he had accomplished before his doctrine of evolution divided the scientific world into opposite parties procured him very inadequate recognition. In 1870, when his name was presented for election to the French Academy of Sciences, Emile Blanchard spoke of him as an "intelligent amateur," and Elie de Beaumont of his work as the "froth of science." The younger scientific thinkers of England and Germany had at that time accepted his doctrine of the origin of species, but in France he had few adherents. In 1872 he was defeated a second time, but in 1878 he was triumphantly elected a corresponding member of the French Academy.

Darwin's work on board the *Beagle* won him nothing but credit. The scientists of England recognized him as an accurate, watchful, and sagacious observer. Some, particularly Sir Charles Lyell, in the fertile suggestions strewn through his journal, adumbrations of the great doctrines which he set forth in his riper years, saw the reflections of thoughts which were forming in their own minds, and perceived the marks of an original mind of the highest order. The ingenious and highly important inductions presented in the work on the coral reefs found general acceptance, and have remained the current doctrine until the present day, although essential modifications, suggested by Murray, seem likely now to supplant the original theory. The simple, yet intensely interesting, "Naturalist's Voyage round the World," the first edition of which was published in 1845, made him known to the reading public.

Charles Darwin never recovered from the physiological disturbances produced by seasickness, from which he was almost a constant sufferer during the five years' cruise. It was only by the quietest mode of living, and the carefullest regimen, that he was able to keep himself in moderate health and working order. The periods of reconvalescence from the troublesome fits of indisposition with which he was afflicted he turned to account in pursuing his patient observations and ingenious experiments with nature. In the beginning of 1839, three years after his return, he married his cousin, Emma Wedgwood. In 1842 they took up their residence at Down, Beckenham, in the county of Kent, where he was a magistrate. His pecuniary circumstances were such as to place him above the material cares of life, and to relieve him of the necessity of devoting his energies to supplying the daily wants of his family. About a year before he died he fell heir to the fortune of his elder brother, the faithful friend of Mrs. Carlyle. His tastes were almost purely scientific. In art, music, amusements, literature, politics, or society, he took but slight interest. Charles Darwin's manners and feelings were simple and child-like. In his bearing he was altogether amiable and kind. His modesty and unconsciousness of his own greatness were remarkable. In sending a communication to a journal, he would ask for its insertion with doubting hesitancy. The influence of his kindly attention and sympathy upon young scientific men was incalculable. He was ever ready to listen, suggest, and assist. The influence of his writings, also, was powerful in promoting the modest, conscientious, and generous tone which distinguishes modern scientific discussion in England. His sons, George and Francis Darwin, aided him in the multitudinous researches which he continued without remission to the close of his life.

From the time when he went to reside at Down, Darwin devoted himself to elaborating and testing the theories of the evolution of species, of which hints had been thrown out in his journal of the voyage and other earlier writings. In 1851 and 1853 the Ray Society published a valuable and thoroughly systematic monograph on the family Cirripedia, the group of singular crustaceans known as barnacles and sea-acorns. In another monograph, published by the Philosophical Society, he described the fossil species of the same family. In the year 1859 was given to the world the memorable work in which the Darwinian theory was propounded and elucidated, with its full title, "The Origin of Species by Means of Natural Selection; or, the Preservation of Favored Races in the Struggle for Life."

The doctrine of Darwin is, in general terms, that of the evolution of organic types through the operation of the law of natural selection, or the adaptation of the type to its environment through the survival of the fittest individuals. The elements of this evolution are de-

fined to be the perpetuation through the principle of heredity and the accumulation through the principle of variation of the traits which are best suited to survive the destructive struggle for existence, in which the weaker individuals perish and the old traits brought down from former conditions of life disappear. Ideas of evolution were already penetrating the thought of the time, and were the outcome of the materialistic and utilitarian philosophy which dominated the younger minds of England, where it had its birth. Darwin was naturally not the first, nor the only one, to conceive this great theory, which harmonized with the reigning system of philosophy. Without seeking for the original enunciation of the development hypothesis in the writings of Aristotle or Lucretius, in the philosophical theories of Kant or Laplace, in Goethe's scientific speculations or Buffon's bold guesses, without identifying it with the fantastic theories of Erasmus, or assailing its originality on the strength of the similar views which had been put forth a generation before by the German scientist Lamarck, there were scientific thinkers of Darwin's own time who were ruminating over the same conception. The idea was in the air; and one thinker, Alfred Russel Wallace, had independently arrived at conclusions almost identical. He generously waived the question of precedence when Darwin stepped forth as the teacher of the new doctrine. To collect, systematize, and interpret the mass of evidence which Darwin brought to bear upon the theory, and to deduce those secondary laws which explain the manner of the development of species, were feats which Darwin's genius for investigation and theoretical deduction alone could have accomplished. The theory was at once accepted by many of the leading minds in science. Others contributed additional proofs, particularly Haeckel, whose strong scientific imagination led him further than Darwin's cautious and conscientious spirit would allow his own vigorous theoretical powers to carry him. Haeckel brought valuable corroborative evidence from the science of embryology. New discoveries in paleontology added strength to the hypothesis year by year. But Darwin's own original observations on the production of variations in fowls, pigeons, and rabbits, on sports and hybrids in plants, on the relation of the habits of insects to the fertilization of plants, on the sexual attractions of animals, his work in co-ordinating a host of facts and phenomena, many of them before unnoted, with the terms of his theory, made up a body of proof which left little to be done in the elaboration or the demonstration of the doctrine of natural selection. The discrepancies and inconsistencies in his theories were as clearly perceived by him as by his opponents. His mind was always open to doubts, and more ready to admit objections and accept modifications and qualifications than his more ardent disciples thought right. The new doctrine

was assailed in theological circles with a vehement hostility which is known to all the world. His book on "The Descent of Man, and Selection in Relation to Sex," in which the doctrine was applied to the development of the human species, published in 1871, raised this hostility to a higher pitch, and brought upon the pacific and gentle-souled author a storm of denunciation and angry objurcation. Many eminent men of science withheld their acquiescence in the theory, and were disposed, from religious and philosophical grounds, to give greater weight to the scientific objections. When the bulk of scientific authority ranged itself on the side of Darwin, the theologians admitted the compatibility of the theory of descent with the doctrines of revealed religion more readily than they have some of the fundamental laws of science upon their discovery in less scientific ages.

Darwin published, at short intervals, a series of works embodying his amazingly extensive observations with reference to the development theories, and then, before his death, gave to the world, enforced by a wealth of observations and illustrations, collected through long years, one or two other important scientific discoveries. The law of circummutation in plants (see "Annual Cyclopædia" for 1880) was elucidated in "The Power of Movement in Plants" (1881), and his theory of the influence of earthworms in fertilizing the soil (see "Annual Cyclopædia" for 1881), in "The Formation of Vegetable Mold through the Action of Worms, with Observations on their Habits" (1882). His most important work bearing on the theory of descent, besides those mentioned above, is "The Variations of Plants and Animals under Domestication" (1867). The other works of this category are "The Various Contrivances by which Orchids are fertilized by Insects" (1862); "The Movements and Habits of Climbing Plants" (1865); "The Expression of the Emotions in Man and Animals" (1872); "Insectivorous Plants" (1875); "The Effects of Cross and Self Fertilization in the Vegetable Kingdom" (1876); "The Different Forms of Flowers and Plants of the Same Species" (1877). Darwin's books were filled with an immense assemblage of facts. His method was to pile instance upon instance until the reader forms the conclusion in his own mind. It seems as though his mind had gone through the same process, and only reached the theoretical conclusion after the accumulation of the host of facts. Really, his theories were thoughts of his youth, which he spent his whole life in testing and proving. The combination of such a genius for theoretical speculation, with the spirit of the most patient and exact scientific observer, is an example which has done as much to improve scientific method as his ideas have to stimulate scientific thought. A majority of the scientific world have adopted Darwin's views of the evolution of organic nature. A German bibliographer has enumerated, in a catalogue of 36 pages, embracing 312

authors, the books which have been written about the Darwinian hypothesis.

DELAWARE. STATE GOVERNMENT.—The State officers during the year were as follows: Governor, John W. Hall, Democrat; Secretary of State, James L. Wolcott; Treasurer, Robert J. Reynolds; Auditor, John F. Staats; Adjutant-General, J. Park Postles; Superintendent of Public Instruction, James H. Graves; Attorney-General, George Gray; Secretary of Board of Agriculture, Richard Harrington; State Librarian, R. R. Kenney. Judiciary: Chief-Justice, Joseph P. Comegys; Associate Justices, L. G. Wales, John W. Houston, and Edward Wootton; Chancellor, Willard Saulsbury.

STATISTICS.—The State debt may be stated as follows:

The bonds designated as "Series A," payable on the first day of July, 1886, but redeemable at the option of the State at any time after the first day of July, A. D. 1882.....	\$250,000 00
From which deduct amount redeemed January 1, 1883.....	90,000 00
Balance due "Series A".....	\$160,000 00
The bonds designated as "Series B," payable on the first day of July, 1891, but redeemable at the option of the State at any time after the first day of July, 1886.....	\$300,000 00
The bonds designated as "Series C," payable on the first day of July, 1891, but redeemable at the option of the State at any time after the first day of July, 1891.....	165,000 00
Total amount of bonded debt of the State on the first day of January, 1883, exclusive of the school-fund bond.....	625,000 00
Bond of the State to the school fund, bearing interest at the rate of six per cent per annum, payable on the first day of July, 1906.....	156,750 00
Certificate of indebtedness held by Delaware College.....	88,000 00
Total amount of State debt, January 1, 1883.....	\$864,750 00

#### ASSETS.

The semi-annual interest-bearing investment is as follows, viz.:

Mortgage on Junction and Breakwater Railroad.....	\$400,000 00
Mortgage on Breakwater and Frankford Railroad.....	200,000 00
1,275 shares of Farmers' Bank stock, at \$50.....	63,750 00
20 shares of National Bank of Delaware stock, at \$465.....	9,800 00
Total.....	\$673,050 00

The aggregate investments for the benefit of the school fund amount to \$495,749.

Total investments belonging to general fund.....	\$673,050 00
Aggregate investments for the benefit of school fund.....	495,749 00
Amount due the State from all sources January 1, 1883.....	76,384 83
Cash in the Treasury belonging to the general fund, exclusive of the amount required to pay interest and redeem bonds called for January 1, 1883.....	19,501 60
Total amount of assets.....	\$1,264,684 93
Total debt after January 1, 1883.....	864,750 00
Excess of assets over liabilities.....	\$399,934 93

According to the report of the State Treasurer, the receipts and expenditures, present and anticipated, for the year 1882, were as follow:

RECEIPTS.	
Total amount of actual receipts.....	\$141,238 19
Total amount due the State from various sources, not payable until January 1, 1883.....	87,497 72
Amount due the State from the Breakwater and Frankford Railroad Company, January 1, 1882, arrears of interest on mortgage.....	88,886 66
Total.....	\$217,622 57

DISBURSEMENTS.	
Total amount actually disbursed.....	\$94,259 24
Amount set apart for the redemption of bonds called for January 1, 1883.....	90,000 00
Amount set apart to pay interest on four per cent bonds, due January 1, 1883.....	14,800 00
Amount applicable to school fund derived from investments for the benefit of said fund.....	14,991 50
Amount set apart to pay interest on certificate of indebtedness to Delaware College.....	2,490 00
Total.....	\$216,040 74
Balance of receipts, present and anticipated..	\$1,581 83

The general balance in the Treasury, belonging to the general fund, including all moneys due the State, was \$95,885.98.

Of this amount, \$56,999.32 was presently available.

The school fund was augmented by the conversion of the certificates of loan to the Philadelphia, Wilmington, and Baltimore Railroad Company into cash, \$46,750.

"Without increasing the present rate of taxation," says Governor Hall, in his message to the Legislature, "the school fund may be still further augmented by transferring to the same a certain portion of the revenues of the State belonging to the general fund. The rate at which the bonds of the State are being extinguished warrants the conclusion that, on the first day of January, 1885, after defraying the ordinary expenses of the State government, and redeeming all the bonds embraced in 'Series A,' there will be a surplus in the Treasury belonging to the general fund. The bonds embraced in 'Series B' will not be redeemable until July 1st, A. D. 1886, during which time the surplus will steadily increase by the semi-annual receipts. Now, in order to avoid the existence of an idle and inactive fund in the Treasury, and to utilize the moneys as they are received, I recommend that a portion of the revenues now belonging to the general fund be appropriated toward the support of the free schools of the State. This can be done without postponing the payment of the four per cent bonds beyond the period of their maturity or redeemability."

The Legislature of 1880-'81 made an increased appropriation for colored schools, and during the year ending June 30, 1882, there was an increase of 83 per cent in the number of schools and of 1,124 in the number of pupils. There is a school for colored pupils in every hundred except one in the State. Excluding the city of Wilmington, the receipts for colored schools amounted to \$5,329.02; number of schools, 65; of pupils enrolled, 3,067. These schools are under the charge of the Delaware

Association for the Education of Colored People.

The number of indigent deaf and dumb, indigent blind and insane, and also the number of indigent feeble-minded children now maintained in the various institutions outside of the State, the expense of which is apportioned to the different counties, are as follow :

In the Pennsylvania Institution for the Deaf and Dumb..	1
In the Columbia Institution for the Deaf and Dumb....	10
In the Pennsylvania Institution for the Instruction of the Blind .....	2
In the Pennsylvania Training-School for Feeble-minded Children .....	2
In the Pennsylvania Hospital for the Insane.....	2
Total.....	17

The population of the State as finally returned in 1880, and as compared with the returns for 1870, is as follows:

COUNTIES.	1880.	1870.
Kent.....	32,874	29,804
New Castle.....	77,716	63,515
Sussex.....	86,018	81,696
The State.....	146,608	125,015

Of the population in 1880, 74,108 were males and 72,500 females; 137,140 native and 9,468 foreign born; 120,160 white and 26,448 colored.

Of the population, but 35,965 were not natives of the State. Of the foreign population, 5,791 are of Irish, 1,433 of English, 1,179 of German, 285 of Scotch, and 208 of Canadian birth. Of the native population born elsewhere than in Delaware, 11,059 were from Pennsylvania, 9,562 from Maryland, 2,238 from New Jersey, 1,321 from New York, 642 from Virginia, 264 from Massachusetts, 217 from Connecticut, and 1,194 from various other States of the Union.

There were in the State 38,298 males twenty-one years of age and over, of whom 27,447 were native whites, 4,455 foreign whites, and 6,396 colored. Of persons ten years old and upward, 16,912 were unable to read, and 19,414 were unable to write, of whom 6,630 were native whites, 1,716 foreign whites, and 11,068 colored. There were living in the United States 155,517 natives of Delaware.

According to the census, the State produced 3,894,264 bushels of corn, 378,508 of oats, and 1,175,272 of wheat. Accurate statistics of the yield of peaches and berries are not at hand. There were on farms 21,933 horses, 3,931 mules and asses, 5,818 working-oxen, 27,284 milch-cows, 20,450 other cattle, 21,967 sheep, and 48,186 swine.

The following are statistics of Delaware's manufactures: Number of establishments, 746; capital, \$15,655,822; males above sixteen years of age employed, 10,250; females above fifteen years of age employed, 1,426; children and youths employed, 962; yearly wages, \$4,267,349; value of materials, \$12,828,461; value of products, \$20,514,488. Nine States are inferior to Delaware in manufacturing interests.

The statistics of Delaware's cotton manufactures are: Establishments, 8; capital, \$874,570; spindles, 46,188; looms, 822; officers and operators, 797; bales of cotton consumed, 7,512; pounds, 3,236,184; cost of cotton, \$427,855; pounds of product, 2,867,969; yards, 8,644,028; wages of operatives, \$192,727; value of products, \$871,007.

**POLITICAL CONVENTIONS.**—Under the present Constitution each county has three Senators and seven Representatives in the Legislature, while the population of New Castle County is greater than that of Kent and Sussex together. This inequality furnished the chief local issue in the politics of the year. Both political parties pronounced in favor of a remedy, and Governor Hall, in his message, uses the following language on this point: "The large growth of population and wealth in New Castle County since the adoption of the present Constitution has rendered an increase of representation from that county in the Legislature a necessity. It is your duty, therefore, to adopt such legislation as will result in the accomplishment of this needed change or re-adjustment of the basis of representation in the General Assembly."

The Republican State Convention met in Dover, on the 27th of July, and adopted the following platform:

The Republicans of Delaware, in convention assembled, reaffirm their adherence to the cardinal doctrines of Republicanism as enunciated by our National Conventions. We pledge ourselves anew to those great constitutional doctrines, the enforcement of which has made and continued a government "of the people, for the people, by the people."

We demand a fair and full protection of all American industries, believing that the working-men of America ought not to be compelled, upon unfair terms, to compete with the pauper labor of Europe; a fostering care of our shipping interests, that American commerce may have a living chance on the seas; a just and wholesome reform of the civil service as against the Democratic "spoils" system; a free ballot, fair count, and honest return, as against the shotgun and tissue-paper ballot. We affirm our adherence to the doctrine of equal rights for all men, and local self-government, but declare that we are a nation and not a league; and we believe that free schools and a common-school education are the only sure foundations of a free government.

Deploing the untimely death of our chosen leader, the late President, James A. Garfield, regretting "the deep damnation of his taking off," and embalming him in tearful memory, we tender to President Arthur and his Administration our fullest confidence. Taking office under exceptionally adverse circumstances, at a critical period, his coolness, courage, executive ability, and devotion to the true principles of Republicanism, not only excite our warmest admiration, but demand our unqualified and continued support.

We declare the Democratic party of this State to be unworthy of the continued confidence of its people, because having been so long in power they have become utterly regardless of the wishes of the people, as expressed from time to time in their petitions to the Legislature; they have been extravagant of the people's money, and by a system of accounts, both in State and county finances, have concealed from the people full and accurate knowledge of the public funds; they have been profligate beyond parallel in

their allowances to legislative attachés, attorneys, printers, etc., by which they have created and maintained a Ring at the public expense; they are opposed to the education of the poor man's children, believing that the ignorance of the many is necessary to the maintenance of a few; throwing every obstacle in the way of immigration into this State, they have steadily opposed public improvements; they have neglected to take advantage of the low rates of interest upon which money can be borrowed, and by a system of unwise and injurious taxation have crippled the energies of our people and failed to protect the abundant supplies and advantages with which nature has blessed us; in short, they have illustrated the Bourbon who, learning nothing new, ties us to the dead past, regardless of the magnificent energies and improvements which everywhere surround us; that while nature, climate, situation, proximity to markets, are all favoring our State, we find the one impeding obstacle to be Democratic control. To remedy these evils we declare ourselves to be the Party of Progress and Reform, and affirm our adherence to the following doctrines which we believe to be for the welfare of our people:

Representation on the basis of population is a fundamental principle of true republican government, and ought to be established.

The State should be divided into senatorial and representative districts, and the Senators and Representatives in the General Assembly should be elected in such districts exclusively by the people thereof; and the counties divided into levy court districts, and the commissioners elected exclusively by the people thereof; thus securing the right of the minority to be represented in both these bodies.

All county officers should be elected directly by the people thereof, and their pay should not exceed a reasonable compensation for the service rendered.

Our present judicial system ought to be simplified, so that justice in civil and criminal causes may be more speedily, less expensively, and more conveniently administered.

More liberal exemption laws should be enacted, applicable to all debts hereafter contracted, and in any such enactments it should especially be provided that wages for the current year should be wholly exempt from attachment or execution process.

Our present assessment and collection laws were conceived in sin and born of iniquity; the purposes of their being was and is exclusively to perpetuate the misrule of the Democratic party, and their administration by the levy courts of the several counties has, in pursuance of that purpose, been in derogation of the rights of freemen, costly, unjust, partisan, and dishonest.

That to secure these objects and insure a wise economy in the expenditure of the people's money, and the natural and legitimate growth of our State, the time has come for such a general remodeling of our laws and system of government as to demand a change in the organic law; and we therefore declare ourselves in favor of a convention of the people to so alter and amend the Constitution of the State as will secure that retrenchment and reform so necessary to its growth and prosperity.

Albert H. Curry, of Sussex County, was nominated for Governor, and Washington Hastings, of Wilmington, for Congressman.

The Democratic State Convention met in Dover, on the 22d of August, and adopted the following platform:

*Resolved*, That the results of wise, honest, prudent, and economical administration by the Democratic party of the government of the State of Delaware for many years, are attested by the admirable condition of our finances, combining a State credit as high, with taxation as low, as the richest and proudest of our sisters of the Union.

That with assets exceeding our liabilities our State debt has been rapidly reduced and funded at the most favorable rates of interest, and on terms that place its speedy extinction within control.

That the duty of popular education has been fulfilled by a common-school system steadily improved and liberally sustained.

That strictly complying with public obligation, not a dollar has been lost to the Treasury by the defalcation of a Democratic official.

That security to property and person has been carefully maintained, except in a single case, wherein the rancorous fanaticism of our political opponents defeated the administration of justice, and prevented a shocking crime from being visited with condign punishment.

*Resolved*, That we are in favor of such amendments to the Constitution of the State—either by a constitutional convention or legislative enactments—as may be necessary to reform and improve our judicial system, give to New Castle County a just and fair proportion of the representatives in the Legislature, and correct the many deficiencies of the present Constitution.

*Resolved*, That despite the misrepresentation, falsehood, and abuse poured upon them by the radical press and orators, the laws of Delaware relating to the assessment and payment of taxes afford just and ample facilities for the qualification of every voter—far greater than the registration laws of Pennsylvania and New York under the control of the Republican party.

*Resolved*, That we cherish the free-school system as one of the corner-stones of a good and stable government, and are in favor of its further improvement and development as an educator of the poor as well as the rich; but we denounce, as an obstacle to education, the policy of the Republican party, which looks toward the gradual establishment of mixed schools.

*Resolved*, That the interests of all classes and occupations of the American people demand an early and thorough revision and reform of the present unequal, unjust, antiquated, and obstructive system of tariff laws, and the substitution in lieu thereof of a judicious and moderate arrangement of duties upon imports which will check the growth of monopolies, increase the public revenue, and thereby render other taxes unnecessary, will benefit agriculture, encourage commerce, and revive American shipping, and thus open the markets of the world to our agricultural products and to our manufacturers, and enable them to compete in foreign markets, will secure steady wages and a reduced cost of living to the laboring classes, and tend to avoid the disastrous conflicts between capital and labor which result in large degree from a glutted home market and consequent stoppage of labor and production.

*Resolved*, That the exposure at last of the long-continued and systematic frauds in the postal service; the admitted ruin of our once glorious navy and its recommitment to the hands that destroyed it; the gross and profligate expenditure in every branch of the public service, which attained this year, in addition to the interest upon the public debt, to the fearful sum of \$300,000,000, should warn the people of the necessity of withdrawing the control of the Federal Government from the Republican party.

*Resolved*, That the shameless and cruel exaction by the Republican chairman, Jay Hubbell, of a percentage of the wages of every Federal employé, regardless of age or sex, with his public assurance that such action "is not objected to in any official quarter," involves the entire Republican Administration in the meanness and guilt of his conduct, which should be visited by the condemnation of all honest men.

*Resolved*, That in their retention in places of party trust of Dorsey, the Star Route plunderer, and the advancement of similar notorious and disreputable characters to positions of party leadership in Delaware and elsewhere, the Republican managers have

exhibited a shameless effrontery offensive to the public sense of decency and degrading to American politics.

*Resolved*, That no incident of American politics is more corrupt and discreditable than the proposed bargain and sale of the confidential offices of the United States Senate by the solid Republican party in that body to a disreputable renegade and political adventurer, who qualified himself for the alliance by combining the worst elements of society to accomplish the repudiation of the lawful debt of an ancient and honored commonwealth. And that the open and shameless coalitions made or tendered everywhere throughout the South by the administration with every political prostitute and ready recipient of radical money and official position, deserves and must receive the scorn and contempt of all decent men.

*Resolved*, That we view with apprehension the creation of an overgrown army of officials, and their organized control over and interference with popular elections, by the corrupt use of public money and abuse of their official powers; and that we denounce as fundamentally false and dangerous the present "spoils system" of the Republican party, in relation to public offices, and declare that if our elections are to be fair and free, and the form of our government is to be maintained, the public offices must be filled and administered with a view to honest and efficient public service, and not be made, as they now are, the mere spoils of party conquest.

*Resolved*, That the efforts of all self-respecting citizens of Delaware are due, and are hereby earnestly invited to assist in defeating at the polls a party led and organized as is the Republican party of the State to-day, who seek to control the State not for its true interests, but for the spoils of office and to gratify personal ambition, and rely for their success only upon banded ignorance, race prejudice and profligacy within, and the corrupting power of money gathered from without the State.

Charles C. Stockley, of Sussex County, was nominated for Governor, and Charles B. Lore, of Wilmington, for Congressman.

Charles C. Stockley was born in Georgetown, on November 6, 1819, and received the rudiments of his education at a local school. He supplemented this by a course at a private school in Philadelphia, after which he engaged in mercantile business in that city, and subsequently in Millsboro, Sussex County. While living at Millsboro he was elected County Treasurer, and in 1856 Sheriff. In 1873 he was elected State Senator, and in the second session of his term, in 1875, was made Speaker of the Senate. Of late years Mr. Stockley has been chiefly known as a railroad man. He has been for some years President of the Farmers' Bank of Georgetown. He is a large landholder, and lives on one of his farms, some three miles from Georgetown.

Charles Brown Lore was born at Cantwell's Bridge, now Odessa, March 16, 1831. His father, Eldad Lore, was engaged there in the lumber business. He received a rudimentary education in the public school at Cantwell's Bridge, and after a preparatory course at the Middletown Academy he entered Dickinson College in 1848, and graduated with the honors of his class in 1852.

After leaving college he commenced the study of the law under Judge John K. Findley, of Philadelphia. He served as Clerk of the House of Representatives through the ses-

sion of 1856-'57. Immediately after this he turned his attention to the ministry, and the Methodist Episcopal Conference of 1858 accepted him on trial, and assigned him to the Princess Anne church, in the Snow Hill district, where he preached for one year. At the end of that time Mr. Lore withdrew from the ministry, and, going to Wilmington, resumed the study of the law under the late Chancellor Bates. He was admitted to the bar in November, 1861. In 1869 he was appointed Attorney-General, and held the office five years.

Two Greenback Conventions made nominations, and two Temperance Conventions were held, which made no nominations. The State Grange took action against bribery at elections, and in favor of representation by districts.

The election resulted in the choice of the Democratic ticket. The vote was as follows: Stockley, 16,558; Curry, 14,620; majority for Stockley, 1,938. Lore, 16,563; Hastings, 14,640; majority for Lore, 1,923. The Legislature is unanimously Democratic in the House, and contains but one Republican in the Senate.

DE LONG, GEORGE W., commander of the lost exploring vessel *Jeannette*, perished of hunger with a number of his crew while endeavoring to retreat to the settlements on the Lena River, in Siberia, in the winter of 1881. De Long was an officer of the United States Navy, of the rank of commander. He was born in New York, in 1844. He passed through the course of naval instruction at Annapolis, and rose rapidly in the service to the grade of lieutenant, which he attained in 1869. In 1871 he obtained leave of absence for two years, which he spent in Europe. He married Miss Wolien, at Havre. He was attached to the service of the French line of transatlantic steamers for a time. From 1876 to 1878 he directed the training-ship *St. Mary*, at New York.

De Long had already, in 1874, taken part in the polar expedition of the *Juniata*, under the command of Captain L. Braine. While the vessel was lying at Upernavik, in Greenland, he undertook the perilous task of penetrating farther to the northward, at the head of an exploring party, in the steam-launch *Little Juniata*. He pushed through the ice to within sight of Cape York, where he was hindered from landing by the pack. Scarcely had he returned to the United States when he volunteered and was engaged to lead the *Jeannette* expedition, which was to be fitted out at the expense of the proprietor of the "New York Herald." (For the record of the voyage, and of the hardships and untimely end of the commander and his companions, see GEOGRAPHICAL PROGRESS AND DISCOVERY.)

DENMARK, a constitutional monarchy in Northern Europe. The King, who must be a member of the Lutheran Evangelical Church, which is the state religion, exercises the executive power under the advice of his ministers, who are responsible to the Rigsdag, or Diet.

The Rigsdag consists of two Houses—the Landsting, of 66 members, 12 nominated for life by the King, and the rest chosen for eight years by the indirect system of election; and the Folkething, of 102 members, elected directly by universal suffrage for the term of three years. The dependency of Iceland has its own Constitution and Legislative Assembly, the Althing, with a minister for Iceland, appointed by the King and responsible to the Althing, at the head of the administration.

The present King of Denmark, Christian IX, born April 8, 1818, was appointed to the succession by the Treaty of London of May 8, 1852, and by the Danish law of succession made the following year. He succeeded Frederick VII, November 15, 1863. Prince Frederick, the heir-apparent, was born in 1843.

The present State Council, which was first formed June 15, 1875, is composed as follows: J. B. S. Estrup, Minister of Finance and President; Otto Ditlev, Baron Rosenørn-Lehn, Minister of Foreign Affairs, appointed October 11, 1875; E. V. R. Skeel, Minister of the Interior; J. Seavenius, Minister of Religion and Public Instruction, appointed August 24, 1880; J. M. V. Nellesman, Minister of Justice and for Iceland; N. F. Ravn, Minister of the Navy, appointed January 4, 1879, and since April 1, 1881, Minister of War. The Council acts under the presidency of the King. The Crown Prince has a seat.

**STATISTICS.**—The area and population of the kingdom of Denmark, according to the census of February 1, 1880, were as follow:

DIVISIONS.	Area in square miles.	POPULATION.		
		Male.	Female.	Total.
City of Copenhagen	74	103,852	125,998	234,850
Islands	5,076	425,544	439,824	865,678
Jutland	9,850	432,664	435,947	868,511
Total	21,667	967,960	1,001,679	1,969,089

The total area of the dependencies of the Danish crown, including the inhabited portion only of Greenland, is 758,885 square miles. The population of the Faroe Isles is 11,221; of Iceland, 72,438; of Greenland, about 10,000 (in 1878); of the Antilles, 33,763; making the total population of the dependencies, 127,400. The population of Denmark and its dependencies is therefore 2,096,400 altogether. Including Fredericksberg and other suburbs the population of Copenhagen was 273,323 in 1880. The population of the other chief cities was as follows: Aarhus, 24,881; Odense, 20,804; Aalborg, 14,152; Randers, 13,457; Horsens, 12,652. The inhabitants of the kingdom were all returned as Evangelical Lutherans except 1,363 Reformed, 3,000 Catholics, 3,687 Baptists, 792 Irvingites, 1,722 Mormons, 1,919 of other sects, 3,946 Israelites, and 1,074 of no religion. All were born in Denmark and its possessions except 33,152 of German and 24,148 of Swedish birth, with about 5,000 from

other countries. Emigration is mostly to the United States, and has been considerable for about a dozen years past. There were 765 emigrants in 1868, 4,359 in 1869, 3,525 in 1870, 3,906 in 1871, 6,893 in 1872, 7,200 in 1873, 3,322 in 1874, 2,088 in 1875, 1,581 in 1876, 1,877 in 1877, 2,972 in 1878, 3,103 in 1879, 5,667 in 1880, and 7,985 in 1881.

**COMMERCE.**—The trade of Denmark with the different countries of the world was reported for 1880 as follows in crowns (1 crown = 26·8 cents):

COUNTRIES.	Imports.	Exports.
England	53,061,000	75,994,000
Germany	80,428,000	66,528,000
Sweden	27,762,000	26,718,000
Norway	6,114,000	15,770,000
Russia	10,293,000	1,071,000
Netherlands	6,164,000	1,575,000
Belgium	2,824,000	341,000
France	4,270,000	998,000
Iceland	3,112,000	3,194,000
Greenland	565,000	478,000
United States	17,867,000	1,244,000
Danish Antilles	1,018,000	148,000
Brazil	368,000	6,000
Faroe Isles	429,000	483,000
Other nations	13,081,000	2,014,000
Total	227,886,000	196,557,000

The imports and exports of the different classes of merchandise in 1880, compared with those of 1879, were as follow in millions of crowns and tenths of millions:

ARTICLES.	1880.		1879.	
	Imports.	Exports.	Imports.	Exports.
Alimentary articles	87·3	151·0	75·5	122·6
Raw materials	69·4	21·7	55·2	16·9
Manufactures	58·3	10·4	56·0	7·9
Machinery and other means of production.	12·4	13·4	9·3	10·8
Total	227·4	196·5	199·0	158·1

Navigation reports state that in the coasting-trade 14,813 sailing-vessels, registering 180,580 tons, and 6,426 steam-vessels, registering 164,879 tons, entered Danish ports in 1880; and in transmarine commerce 15,935 sailing-vessels, registering 793,205 tons, and 7,142 steamers, registering 511,987 tons. The merchant fleet of Denmark counted in 1881 3,016 sailing-vessels above 4 tons, aggregating 203,555 tons, a decline of 9,646 tons since 1878, and 202 steamers, of 51,984 tons, an increase of 6,860 tons in the same period.

There were 985 miles of railroad in operation in 1882, of which 775 belonged to the state. The state telegraph counted 2,205 miles of line and 5,840 miles of wire in 1880. The dispatches sent aggregated 1,125,000, of which, besides 37,900 official dispatches, 442,000 were domestic and 644,000 international. The number of letters and postal-cards carried by the post-office was 29,604,000.

**FINANCE.**—The revenues for the fiscal year 1880-'81 (ending March 31st) amounted to 51,745,463 crowns (\$13,868,000), against 47,521,957 crowns in 1879-'80; the expenditures to

47,543,367 crowns (\$12,742,000), against 44,170,634 crowns in 1879-'80. The budget for 1882-'83, voted May 12th, provides for a total expenditure of 52,624,199 crowns (\$14,103,000), and states the revenues at 49,856,050 crowns (\$12,093,000). Of the total receipts, 9,117,000 crowns are raised by direct taxes imposed on land and houses; 30,791,000 crowns are raised by indirect taxation, of which about 20,000,000 crowns come from customs, 7,000,000 crowns from stamps and fees, and 3,000,000 crowns from the excise duty on liquor; 1,176,000 crowns are the net revenues from the domains and forests; 3,134,200 crowns the net profits on the railroads, 840,000 crowns the profits of the Government lottery, 849,000 crowns the interest from the reserve funds, and 1,055,000 crowns the interest on improvement loans. The postal service shows a slight surplus revenue, balanced by a small deficit in the telegraph service. The gross receipts from the railroads are 11,440,200, and the running expenses 8,306,000 crowns. The principal expenses are 9,879,800 crowns for interest on the public debt, 9,004,309 crowns for the army and 5,732,585 crowns for the navy, 7,539,174 crowns for public works, and 2,227,100 crowns for subsidies and advances, about 3,350,000 crowns for pensions and 1,125,000 crowns for the civil list and appanages, 1,340,000 crowns for worship and instruction, 2,500,000 crowns for the administration of justice, 3,000,000 crowns for administration of the finances, and 3,798,000 crowns for extraordinary expenditures in the various departments.

The public debt amounted on March 31, 1880, to 173,326,628 crowns, and the assets of the Government to 98,059,731 crowns, leaving a net indebtedness of 75,266,897 crowns. The funded domestic debt amounted to 156,489,841 crowns, besides 858,914 crowns which were payable. The floating liabilities were 2,074,206 crowns. The foreign debt amounted to 13,903,667 crowns, most of which consisted of English loans borrowed at 4 per cent. The assets comprised 33,117,722 crowns, invested in productive public works; 37,142,992 crowns in loans and securities, constituting the reserve fund; and 27,799,017 crowns in various assets. The total amount expended on the Government railroads up to that date was 72,115,731 crowns.

**ARMY AND NAVY.**—Military service is universal and obligatory, according to the military laws of July 6, 1867, and July 25, 1880. The term of service begins at the age of twenty-two, and lasts sixteen years, eight in the line and eight in the reserve. Not more than six to eleven months of actual service are required from the infantry and twenty months from the cavalry, only enough men being kept with the colors as are necessary for garrison duty. The number of soldiers in the first ban, or active period of service, in 1881, was 35,293: in the infantry, 26,992; cavalry, 2,180; artillery, 4,755; engineers, 1,366. The number in the

second ban, or reserve, was 10,925 infantry and 2,793 artillery, together 13,718. The total war strength of the army, counting officers and men, is 50,522. (See NAVIES OF EUROPE.)

**POLITICAL EVENTS.**—Owing to the large personal power retained by the King in Denmark and the diversity of representation in the two Legislative Houses, Denmark is governed by a ministry which is not in accord with the majority of the Lower House, and a conflict has occurred between the majority on the one side, and the Government and the Upper House on the other. This culminated in a constitutional crisis, the elements of which were described in the "Annual Cyclopædia" for 1881. A compromise on the disputed items in the budget was finally arrived at in May. The Radical majority in the Folkething triumphed in the main points. The increase of official salaries was not granted for those who draw over 2,500 crowns a year, and the deficit of the University of Copenhagen must be covered by drawing on its capital funds or by a loan. The extraordinary outlays for military purposes projected by the ministry were agreed to by the Lower House. The struggle was mainly over the interpretation of the Constitution, the Folkething, which had been twice dissolved and for the third time returned with a Radical majority, claiming the exclusive right to vote the budget, and demanding that its votes on money bills should be simply registered in the Landsthing. The vast plans of the ministers for works of military defense were postponed until the following session. In November, in the early part of the regular annual session, the project was laid before the Diet again, but augmented by several millions. It involves the expenditure of 72,283,500 crowns, to be spread over ten years. The chief items, are 34,000,000 crowns for land fortifications and 13,270,000 crowns for sea fortifications at Copenhagen, 8,800,000 crowns for enlarging the navy, 6,900,000 for a fortress at Helgenäs, on the east coast of Jutland, and 3,425,000 for a navy-yard. The rest is for minor fortifications.

In the primary elections for the Landsthing in September, the Right, the party of the Government, gained largely, carrying many districts which had recently returned Radical delegates to the Folkething.

**FAMINE IN ICELAND.**—The severe polar winter of 1881-'82 caused a famine in Iceland. Owing to the masses of ice which collected on the northern coast, winter temperatures and snow lasted until the autumn of 1882, rendering agriculture impossible in some districts, and destroying large numbers of cattle and ponies, which perished for lack of fodder. In the northern part of the island the hay-crop failed entirely. Epidemics of small-pox and measles increased the distress of the people. Provisions were sent to the suffering Icelanders from England and Denmark. More timely assistance would have been rendered if the reports of the calamity had not been contradictory.

DIPLOMATIC CORRESPONDENCE OF THE UNITED STATES. Very few subjects of importance are embraced in the correspondence of the State Department during 1882. The passage of the act to restrain the immigration of Chinese led to an investigation of its provisions. It seemed to prohibit the transit of Chinese laborers across the territory of the United States, and an inquiry on the part of the Chinese embassy was answered by the following letter in explanation:

DEPARTMENT OF STATE, WASHINGTON, }  
January 6, 1883. }

MR. CHENG TSAO JU, ETC., ETC., ETC.

Sir: On June 28, 1882, the *chargé d'affaires ad interim* of your legation, Mr. Tsu Shau Pang, wrote to me touching the question arising under the act of May 6, 1882, relative to the transit across the territory of the United States of Chinese laborers proceeding to or returning from Cuba and other foreign countries.

I am happy to inform you that this Government has reached the conclusion that the transit through the United States of Chinese subjects, proceeding to or from a third country, is permissible under the act in question, with certain precautions against abuses.

An opinion which I have received from the Attorney-General sets forth the grounds on which this conclusion is reached, which, briefly recapitulated, are as follows:

"The preamble of the act itself reads: 'Whereas, in the opinion of the Government of the United States, the coming of Chinese laborers to this country endangers the good order of certain localities within the territory thereof,' and it is thereupon enacted that the coming of Chinese laborers to the United States be . . . suspended, and, during such suspension, it shall not be lawful for any Chinese laborer to come, or having so come . . . to remain within the United States."

The act is based upon the treaty of November 17, 1880, the provisions whereof it is designated to execute. In that treaty it is premised that "a modification of existing treaties" has become necessary in consequence of the increasing immigration of Chinese laborers and the embarrassments caused by such immigration, and thereupon the Government of China agrees that whenever, in the opinion of this Government, injurious effects are threatened or caused by "the coming of Chinese laborers to the United States or their residence therein," such coming or residence may be regulated, limited, or suspended, but may not be absolutely prohibited. The treaty adds: "The limitation or suspension shall be reasonable, and shall apply only to Chinese who may go to the United States as laborers, other classes not being included in the limitations. Legislation taken in regard to Chinese laborers will be of such a character only as is necessary to enforce the regulation, limitation, or suspension of immigration, and immigrants shall not be subject to personal maltreatment or abuse."

In the views of the Attorney-General, the act of 6th of May, 1880, being intended to carry into effect the stipulations of the treaty, is to be construed in the light thereof, and has reference only to the Chinese who come here to stay as laborers. It is only with immigrants and with those who come as laborers that the treaty and the statute deal. Looking, therefore, at the mischief and the remedy, and to the treaty and the act taken together, this Government, adopting the conclusion of the Attorney-General, does "not think that a Chinese laborer coming to this country merely to pass through it can be considered as within the prohibition of the law, he being neither an immigrant nor a laborer coming here as a laborer."

With regard to the necessity of Chinese laborers in transit being provided with evidence that they are not Chinese coming here as immigrants or as laborers, the Attorney-General says: "As the prohibition of

the act applies to Chinese laborers coming into the country to stay as laborers, and as the regulations touching certificates of identification prescribed by the fourth and sixth sections are auxiliary to that end, and intended to prevent frauds upon the act, and therefore applicable only to Chinese coming here for permanent or temporary residence, I am of opinion that Chinese passing through this country to other countries are not required, before crossing our borders, to produce the specified certificates of identification, provided they competently prove in some other manner their status as mere transient passengers; of course the certificate would dispense with other proof." The character of such proof may very properly be regulated by the Secretary of the Treasury. I have brought the matter in this shape to the attention of the Secretary of the Treasury, and requested that he will frame such regulations as may be necessary to permit the transit of Chinese laborers. As soon as the action of my colleague shall be made known to me I will communicate it to you. Accept, sir, a renewed assurance of my high consideration.

FREDERICK T. FRELINGHUYSEN.

In the "Annual Cyclopædia" for 1881, the correspondence between the United States and Chili and Peru is very fully presented. The change which took place in the administration of the Government by the death of President Garfield, has been followed by a suspension of the measures designed by his Administration. The objects contemplated by him, and the political and commercial relations with the South American states, which it was his aim to establish, have been explained by Mr. Blaine, the Secretary of State at that period, and issued in a periodical published in Chicago. The following are extracts:

The foreign policy of President Garfield's Administration had two principal objects in view: 1. To bring about peace and prevent future wars in North and South America. 2. To cultivate such friendly commercial relations with all American countries as would lead to a large increase in the export trade of the United States, by supplying those fabrics in which we are abundantly able to compete with the manufacturing nations of Europe. To attain the second object the first must be accomplished. It would be idle to attempt the development and enlargement of our trade with the countries of North and South America if that trade were liable at any unforeseen moment to be violently interrupted by such wars as that which for three years has engrossed and almost engulfed Chili, Peru, and Bolivia; as that which was barely averted by the friendly offices of the United States between Chili and the Argentine Republic; as that which has been postponed by the same good offices, but not decisively abandoned, between Mexico and Guatemala; as that which is threatened between Brazil and Uruguay; as that which is even now foreshadowed between Brazil and the Argentine states. Peace is essential to commerce, is the very life of honest trade, is the solid basis of international prosperity; and yet there is no part of the world where a resort to arms is so prompt as in the Spanish-American republics. Those republics have grown out of the old colonial divisions, formed from capricious grants to favorites by royal charter, and their boundaries are, in many cases, not clearly defined, and consequently afford the bases of continual disputes, breaking forth too often in open war. To induce the Spanish-American states to adopt some peaceful mode of adjusting their frequently recurring contentions was regarded by the late President as one of the most honorable and useful ends to which the diplomacy of the United States could contribute—useful especially to those states by securing permanent peace within all their

borders, and useful to our own country by affording a coveted opportunity for extending its commerce and securing enlarged fields for our products and manufactures. Instead of friendly intervention here and there, patching up a treaty between two countries to-day, securing a truce between two others to-morrow, it was apparent to the President that a more comprehensive plan should be adopted if war was to cease in the Western Hemisphere. It was evident that certain European powers had in the past been interested in promoting strife between the Spanish-American countries, and might be so interested in the future, while the interest of the United States was wholly and always on the side of peace with all our American neighbors, and peace between them all.

**GENERAL GARFIELD'S IDEAS.**—It was, therefore, the President's belief that mere incidental and partial adjustments failed to attain the desired end, and that a common agreement of peace, permanent in its character and continental in its extent, should if possible be secured. To effect this end it had been resolved, before the fatal shot of July 2d, to invite all the independent governments of North and South America to meet in a Peace Congress at Washington. The date to be assigned was March 15, 1882, and the invitations would have been issued directly after the New England tour, which the President was not permitted to make. Nearly six months later, on the 23d of November, President Garfield's successor issued the invitations for the Peace Congress, in the same spirit and scope and with the same limitations and restrictions that had been originally designed. As soon as the project was understood in South America, it received a most cordial approval, and some of the countries, not following the leisurely routine of diplomatic correspondence, made haste to accept the invitation. There can be no doubt that within a brief period all the nations invited would have formally signified their readiness to attend the Congress; but in six weeks after the invitations had gone to the several countries President Arthur caused them to be recalled, or at least suspended. The subject was afterward referred to Congress in a special message, in which the President ably vindicated his constitutional right to assemble the Peace Congress; but expressed a desire that the legislative department of the Government should give an opinion upon the expediency of the step before the Congress should be allowed to convene. Meanwhile the nations that received the invitations were in an embarrassing situation, for, after they were asked by the President to come, they found that the matter had been reconsidered and referred to another department of the Government. This change was universally accepted as a practical though indirect abandonment of the project, for it was not, from the first, probable that Congress would take any action whatever upon the subject. The good-will and welcome of the invitation would be destroyed by a long debate in the Senate and House, in which the question would necessarily become intermixed with personal and party politics, and the project would be ultimately wrecked from the same cause and by the same process that destroyed the usefulness of the Panama Congress more than fifty years ago, when Mr. Clay was Secretary of State. The time for congressional action would have been after the Peace Conference had closed its labors. The conference could not agree upon anything that would be binding upon the United States unless assented to as a treaty by the Senate or enacted into a law by both branches. The assembling of the Peace Conference, as President Arthur so well demonstrated, was not in derogation of any right or prerogative of the Senate or House. The money necessary for the expenses of the conference—which would not have exceeded \$10,000—could not with reason or propriety have been refused by Congress. If it had been refused, patriotism and philanthropy would have promptly supplied it.

**THE PEACE CONGRESS.**—Such friendly interventions as the proposed Peace Congress, and as the at-

tempt to restore peace between Chili and Peru, fall within the line of both duty and interest on the part of the United States. Nations, like individuals, often require the aid of a common friend to restore relations of amity. Peru and Chili are in deplorable need of a wise and powerful mediator. Though exhausted by war, they are unable to make peace, and unless they shall be aided by the intervention of a friend, political anarchy and social disorder will come to the conquered, and evils scarcely less serious to the conqueror. Our own Government can not take the ground that it will not offer friendly intervention to settle troubles between American countries, unless at the same time it freely concedes to European governments the right of such intervention, and thus consents to a practical destruction of the Monroe doctrine and an unlimited increase of European and monarchical influence on this continent. The late special envoy to Peru and Chili, Mr. Trescott, gives it as his deliberate and published conclusion that if the instructions under which he set out upon his mission had not been revoked, peace between those angry belligerents would have been established as the result of his labors—necessarily to the great benefit of the United States. If our Government does not resume its efforts to secure peace in South America, some European government will be forced to perform that friendly office. The United States can not play between two nations the part of dog in the manger. We must perform the duty of humane intervention ourselves, or give way to foreign governments that are willing to accept the responsibility of the great trust, and secure the enhanced influence and numberless advantages resulting from such a philanthropic and beneficent course.

**A BRIGHT PICTURE.**—A most significant and important result would have followed the assembling of the Peace Congress. A friendship and an intimacy would have been established between the states of North and South America which would have demanded and enforced a closer commercial connection. A movement in the near future as the legitimate outgrowth of assured peace would in all probability have been a great commercial conference at the city of Mexico or at Rio Janeiro, whose deliberations would be directed to a better system of trade on the two continents. To such a conference the Dominion of Canada could properly be asked to send representatives, as that Government is allowed by Great Britain a very large liberty in regulating its commercial relations. In the Peace Congress, to be composed of independent governments, the Dominion could not have taken any part, and was consequently not invited. From this trade conference of the two continents the United States could hardly have failed to gain great advantages. At present the commercial relations of this country with the Spanish-American countries, both continental and insular, are unsatisfactory and unprofitable. Indeed, those relations are absolutely oppressive to the financial interests of the Government and people of the United States. In our current exchanges it requires about \$120,000,000 to pay the balance which Spanish America brings against us every year. This amount is fifty per cent more than the average annual product of the gold and silver mines of the United States during the past five years. This vast sum does not of course go to Spanish America in coin, but it goes across the ocean in coin or its equivalent to pay European countries for manufactured articles which they furnish to Spanish America, a large proportion of which should be furnished by the manufacturers of the United States.

**WORTH A GREAT STRUGGLE.**—In no event could harm have resulted from the assembling of the Peace Congress. Failure was next to impossible. Success might be regarded as certain. The subject to be discussed was peace, and how it can be permanently preserved in North and South America. The labors of the Congress would have probably ended in a well-digested system of arbitration, under which all future troubles between American states could be quickly,

effectually, and satisfactorily adjusted. Such a consummation would have been worth a great struggle and a great sacrifice. It could have been reached without any struggle and would have involved no sacrifice. It was within our grasp. It was ours for the asking. It would have been a signal victory of philanthropy over the selfishness of human ambition; a complete triumph of Christian principles as applied to the affairs of nations. It would have reflected enduring honor on our own country, and would have imparted a new spirit and a new brotherhood to all America. Nor would its influence beyond the sea have been small. The example of seventeen independent nations solemnly agreeing to abolish the arbitrament of the sword, and to settle every dispute by peaceful methods of adjudication, would have exerted an influence to the utmost confines of civilization, and upon the generations of men yet to come. (For further diplomatic questions, see *PERU*.)

**DISCIPLES OF CHRIST.** The churches included under this name have no official general organization; but general voluntary missionary societies have been formed by the association of a large proportion of them, which are intended to represent the whole body in their peculiar work, and to labor for the propagation of its system and doctrines in the United States and foreign countries. With them are affiliated State and district organizations in the States of Arkansas, Indiana, Oregon, Pennsylvania, West Virginia, Nebraska, Kansas, Iowa, Wisconsin, North Carolina, Michigan, Virginia, New York, California, Missouri, Illinois, Ohio, and Kentucky.

The *General Christian Missionary Convention* met in its thirty-third session at Lexington, Ky., October 19th. B. B. Tyler, of Kentucky, presided. The Board of Managers reported that its total receipts, including the money for the Metropolitan Church at Washington, D. C., and the balance in the treasury at the beginning of the year, had been \$25,934. Not including these amounts, the general receipts had been \$7,428. Besides this, the churches in eighteen States had contributed, through their several State or district organizations, for work within their own borders, \$74,038, making the whole amount contributed for the work the convention seeks to promote \$99,972. The Board of Managers had endeavored to supply evangelistic labor, in whole or in part, in Nebraska, Wisconsin, Kansas, Pennsylvania, West Virginia, South Carolina, Alabama, Mississippi, Louisiana, and Tennessee, through the aid of which 16 churches had been organized and 59 assisted, 580 members added, and 237 persons baptized. The State associations reported 3,612 additions, making the whole number of additions 4,192. The interest of Sunday-schools had been looked after, and the "General Christian Sunday-School Association" had been organized, with 100 members. The board had made an attempt, but unsuccessfully, to carry out the plans of the previous General Convention with regard to a German domestic mission, beginning at Cincinnati, O. It was advised to continue its efforts and sustain such a mission, according as its means should allow, and to

establish missions as soon as practicable in other centers of German population. It was also instructed to continue its co-operation with the church in Washington, D. C., until the house of worship is completed there. Since the society was organized, in 1849, the total contributions to its treasury had amounted to \$194,856, while the State treasuries had received since 1870 \$697,116, making the total contributions of the Disciples for domestic missionary work \$891,973. The number of additions to the churches had been, through the special agencies of the General Convention, since 1858, 17,244, and through the State agencies, since 1870, 56,040, making the total number of additions by missionary effort 73,284. Continued efforts were advised by the convention to extend the system of State organizations. D. R. Dungan, of Iowa, was chosen president of the convention for the ensuing year.

The seventh annual meeting of the *Foreign Christian Missionary Society* was held at Lexington, Ky., October 18th and 19th. Isaac Errett presided. The Board of Managers reported that the total receipts for the year had been \$27,431, about twice the amount reported in the preceding year. Reports were received from the missions in Paris, France, 62 church-members and 130 pupils in the Sunday-school and Bible-class; Copenhagen, Denmark, 12 additions, 112 members of Sunday-school, and 2,000 subscribers for the periodical published by the mission; Bardezag, Turkey, 36 additions; and Southampton, Chester, and Liverpool, England, 120 additions. Two missionaries had been sent to India, with four young women dispatched by the Christian Woman's Board of Missions as Bible-readers. Three men of Armenian birth were preparing for service in the Turkish mission, which, it was stated, was chiefly supported by the churches of Kentucky.

**DISCIPLINARY POWER OF LEGISLATIVE ASSEMBLIES OVER THEIR MEMBERS.** UNITED STATES, ENGLAND, GERMANY. —When the sovereignty of a nation is supposed to reside in the people, the legislative assembly represents that sovereignty constitutionally assembled to declare, in conjunction with the executive, its will on the administration of public affairs. Where this sovereignty is not supposed to reside in the people, it is usually declared to rest in the King, Lords, and Commons, which is simply in the executive and legislative departments of the state—thus forming a "Parliamentary Government." The power of the executive is one of approval or disapproval of the measures adopted by the legislature; it serves as a check upon hasty or unconstitutional action. This disapproval is followed by a reconsideration of the objectionable measure on the part of the legislature, and often by its readoption. Thus the legislative assembly is the mode adopted by the sovereignty of a state by which to express its delib-

erate decision as well on private affairs of a civil nature as on public affairs.

These assemblies are designated by various names. In the United States, the Federal Assembly is called Congress, and consists of a Senate and House of Representatives—the local bodies are known as State Legislatures, and consist likewise of a Senate and House of Representatives; in Great Britain, the legislative assembly is called Parliament, and is composed of a House of Lords and a House of Commons; in Germany, the legislative assembly consists of two Houses, the Bundesrath, or Federal Council, which represents the states, and the Reichstag, or Diet of the Realm, which represents the German nation; in France, it is known as the National Assembly, and is composed of two Houses, the Senate and Chamber of Deputies; in the Netherlands, it is called the First and Second Chambers of the States-General.

**ASSEMBLIES, HOW CREATED.**—The manner of creating these assemblies is not really similar in any two nations. In the United States the members of the House of Representatives of Congress are chosen in districts by universal suffrage. The members of the Senate are chosen by the State Legislatures, each House of which nominates a candidate separately, and unitedly they elect. It is evident that, among the members of an assembly thus created, there is a perfect equality of rights and powers, and an equal independence of each other. This independence and sovereignty, likewise, is limited by the provisions of the Constitution under which the body is created, and the rules of order and of business which it may adopt to regulate and control its actions.

**THEIR POWERS.**—In some sections of the Constitution of the United States, the powers of Congress as a legislative assembly are expressly defined; in others, the steps necessary to be taken for the election and organization of the members into a constitutional assembly are authorized, and certain incidental powers over the conduct of members are granted. It is in accordance with these incidental powers that there have taken place in the Congress of the United States some of the details of the subject now under consideration. The Constitution says: "Section 5. . . but a smaller number (than a quorum) may adjourn from day to day, and may be authorized to compel the attendance of absent members in such manner and under such penalties as each House may provide. Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two thirds, expel a member." "Section 6. . . they shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest, during their attendance at the session of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House they shall not be questioned in any other place."

These general provisions of the Constitution grant the authority to each House of Congress to adopt limited regulations over the conduct of its members. It may be said, on the one hand, that the rules of each House derived their force from this grant, while, on the other, it may be asserted, as a general principle, that no such grant was necessary, and that from the nature and objects of each House when convened the rules of its adoption were of sovereign authority. Indeed, it would seem that many of the rules of the British Parliament are based upon this latter view. In questions of order the appeal is made to precedents as well as to the law; for its rules have not been discussed and voted upon within an hour. Their traces are lost in the centuries long past. Indeed, the principle seems to be established in the United States. Cushing\* does not hesitate to say, "It may be laid down that the establishment, in general terms, of a legislative department, is equivalent to a general grant to each branch composing it, of all the powers and privileges which are necessarily incident to a legislative assembly." On the other hand, Mr. Jefferson† lays down the doctrine that the Federal Government being one of limited powers, neither branch of Congress can exercise any powers but those which are clearly delegated to it by the Constitution; and that until they make a law for that purpose, under that provision of the Constitution which authorizes them to make all laws necessary and proper for carrying into effect the powers vested in them by that instrument, neither House has any authority to commit for contempt. Since this view was presented, more than half a century has elapsed, yet no law has been passed, and commitments have been frequently made. The Constitution itself seems to make a distinction between a grant of power to legislate on specified subjects, and the power incidental to a legislative assembly to preserve its organization, and treats of them in separate sections, whereas Mr. Jefferson does not observe the distinction, but applies to the latter an argument which bears on the former. Cushing regards the doctrine above quoted as established by usage and also by the cases of *Burdett vs. Abbott*‡ and *Anderson vs. Dunn*.§ He also refers to a resolution adopted June, 1777, by the old Congress of the Confederation, in which the power of a legislative body to punish for contempt, as incidental to its power to legislate, was most forcibly expressed and maintained. One of its members had been challenged to fight, in consequence of words spoken in debate, and the following resolution was adopted:

*Resolved*, That Congress have, and always had, authority to protect their members from insult, for anything said or done in Congress in the exercise of their

\* "Law and Practice of Legislative Assemblies," § 542.

† "Manual," § 3.

‡ East's "Reports," vol. xiv.

§ Wheaton's "Collection," vol. vi.

duty, which is a privilege essential to the freedom of debate, and to the faithful discharge of the great trust reposed in them by their constituents.

The challenger was thereupon summoned to appear before Congress to answer for his conduct, and, having appeared in obedience to the requisition, and asked pardon of the House, and of the member challenged, he was discharged.

**EXERCISE OF DISCIPLINARY POWER.**—The exercise of disciplinary power by legislative assemblies is intended to preserve the freedom of speech and punish its abuse, to secure due respect to the assembly and to its separate members, and, in a word, to restrain everything of a disorderly nature and that might interfere with the proper conduct of the business. Some illustrations of the proceedings in the discipline of its members in special cases, by Congress, will serve to show its views on the nature and extent of this power, and the reasons for, and manner of, its exercise.

One of the earliest cases brought up the question of the expulsion of a member of the Senate. John Smith took his seat as a Senator from Ohio on October 25, 1803. On November 27, 1807, a resolution was adopted in the Senate to appoint a committee to inquire and report whether it was "compatible with the honor and privileges" of the Senate that John Smith, against whom bills of indictment for treason and misdemeanor had been found in the Circuit Court of Virginia, should be permitted to hold a seat therein. On December 31st the committee reported a resolution that Smith, "by his participation in the conspiracy of Aaron Burr, against the peace, union, and liberties of the people of the United States, has been guilty of conduct incompatible with his duty and station as a Senator, and that he be, therefore, and hereby is, expelled." The depositions of witnesses were taken, and on April 1, 1808, Smith appeared with his counsel before the Senate, who were ready to hear anything he had to offer why the resolution should not be adopted. The objections urged against the adoption of the resolution were, first, that the Senate had no jurisdiction in the case; second, that the evidence did not warrant its adoption. It was contended that the Senate had no power to inquire into any offense of which one of its members may be accused, that is cognizable in a civil court of criminal jurisdiction. In reply, it was said that every man is equally amenable to the general laws of the land, and liable to be prosecuted and punished in the civil courts; but, when a man is clothed with a legislative character, he is placed in a new relation; and, besides being amenable to the judicial tribunals of his country, he becomes, to a certain extent, responsible for his conduct to that body to which he belongs, and that body has a power to inquire into it, without the aid of a civil court. The question on agreeing with the resolution was determined in the negative,

yeas 19, nays 10; two thirds of the Senators present not concurring therein.

The subject of expulsion was extensively discussed in the Senate in 1862, and several Senators were expelled. On December 10, 1861, a resolution to expel Waldo P. Johnson, a Senator from Missouri, was offered and referred to a committee, who reported on January 10, 1862, that Mr. Johnson had left the United States clandestinely, and every rational presumption was that he had gone to the Confederate States, then at open war with the United States. The resolution of expulsion was adopted by a unanimous vote. Truett Polk, a Senator from the same State, was expelled for similar reasons.

A resolution for the expulsion of Jesse D. Bright, a Senator from Indiana, was referred to the Judiciary Committee of the Senate, who reported, on January 13th, that "the facts charged were not sufficient to warrant his expulsion from the Senate." Notwithstanding this report, he was expelled. He had written a letter to Jefferson Davis, as President of the Confederate States, for the introduction to him of a friend who desired to dispose of what he regarded as a great improvement in firearms. The report of the committee was not approved, and the resolution for expulsion was adopted. All the members of the Senate who withdrew from that body and joined the citizens of the Confederate States were likewise expelled. The question was raised that loyalty did not form a part of the qualification of a Senator under the Constitution, and extensively discussed on January 6, 1862.

In the House of Representatives in 1808, the charge was made that Philip Barton Key, who was a member, was a pensioner of the British Government. But in this case the House made no decision that loyalty was necessary to the qualifications of a person. The power of expulsion has been exercised sparingly by Congress, and chiefly by the Senate, although some instances occurred in the House during the civil war. The ground of these expulsions was expressed by the word "disloyalty," and the question was raised whether it was intended to signify disloyalty to the administration of the Government or to the Constitution. No decision, however, was made.

**EXTENT OF CRIMINAL JURISDICTION.**—The criminal jurisdiction of each House of Congress is understood as embracing the misconduct or disorderly behavior of its own members, as well as misdemeanors and offenses committed by other persons, either against the assembly or the members individually. So members may be guilty of misconduct either toward the assembly, or one another, or strangers. Misconduct of members toward the assembly consists of any breaches of decorum or order, or of any disorderly conduct, disobedience of the rules of proceeding, neglect of attendance, etc.; or of any crime, misdemeanor, or mis-

conduct, either civil, moral, or official, which, though not strictly an attack on the House itself, is of such a nature as to render the individual a disgrace\* to the body of which he is a member. Misconduct of the members toward one another consists of insulting remarks in debate, personal assaults, threats, challenges, etc., in reference to which, besides the ordinary remedies at law or otherwise, the assembly interferes to protect the member who is injured, insulted, or threatened. Offenses by members toward other persons of which the assembly has cognizance, consist of injurious and slanderous assertions, either in speech or by writing. The offenses against a legislative assembly, committed by persons who are not members, embrace all offenses against its members individually, all breaches of privilege, whether personal or collective, and all willful obstructions to its regular proceedings and to the free, independent, and full performance of its various functions. Like every other tribunal, a legislative assembly is authorized to punish persons, whether members or others, who are guilty of any contempt toward it by disorderly or contumacious behavior in its presence, or disobedience of its orders.†

CASES PRESENTED.—Some of these offenses have been acted on by one or the other House of Congress. In 1828 Russel Jarvis committed an assault on the private secretary of President John Q. Adams, in the Rotunda of the Capitol, immediately after he had delivered a message from the President to the House, and while he was proceeding with another message to the Senate. A committee was appointed by the House to investigate the subject, a majority of whom reported that the assault was an act done in contempt of the authority and dignity of the House, involving a violation of its own peculiar privileges. They further declared that the power to punish for contempt was not peculiar to the common law of England; but it belonged essentially to every judicial tribunal and to every legislative assembly; it grew out of the great law of self-preservation. They further said that it was a dangerous power, liable to abuse, and that the House should only exercise it "in cases of strong necessity." For reasons stated in the report, it was recommended that the House suspend further proceedings in the case, which was adopted.

In December, 1795, the House of Representatives, on information given by four of its members, ordered the arrest of Robert Randall and Charley Whitney for "a contempt to, and breach of, the privileges of the House, in an unwarrantable attempt to corrupt the integrity of its members." The facts being proved, Whitney was detained in confinement a fortnight, and Randall three weeks, and was reprimanded by the Speaker. In March, 1796, during the

same session, the Committee on Privileges, through Mr. Madison, reported that James Gunn and Frederick Frelinghuysen, Senators, were guilty of a breach of the privileges of the House in sending and bearing a challenge from said Gunn to Mr. Baldwin, a member of the House from Georgia. From letters addressed to the committee, and reported to the House, containing satisfactory apologies and acknowledgments, any further proceedings were deemed unnecessary, and such report was adopted without division. These two cases, occurring so soon after the adoption of the Constitution, and during the life of its framers, contain an express recognition of the power to arrest and punish.

In April, 1832, William Stanberry, member of the House of Representatives from Ohio, complained, by letter to that body, that he had been waylaid in the street, attacked and knocked down by a bludgeon in the hands of Samuel Houston, for words spoken in his place in the House. A resolution providing that Houston should be taken and held in custody by the Sergeant-at-Arms, subject to further orders, was adopted. During its consideration, Mr. Polk (afterward President) urged as an objection that the resolution asserted the doctrine that the House might punish an act not committed in its presence, or interrupting its proceedings, but without further inquiry would deprive a citizen of his liberty. Mr. Wayne, of Georgia, denied the power of the House, in case of contempt, to proceed by peremptory process, unless the contempt had been committed in its immediate presence. He held that the proceedings of a deliberative body, on the subject of contempts, should be parallel to those observed in a court of justice. But these objections were overruled by the vote. Houston was arrested and tried before the House, and sentenced to reprimand by the Speaker. During the trial the power of the House to punish for contempts was extensively discussed, both as derived *ex necessitate rei*, and from the Constitution. The counsel for the defense (Francis S. Key) said that it must be allowed some limitation of the power to punish for contempts was possible and proper; and if it was not confined to immediate acts of interruption of business in the presence of the House, it would be difficult if not impossible to prescribe any other limit. Lord Holt, an English judge, declared his opinion in favor of limiting this power to offenses committed in the presence of the House (see *Ld. Ray. 938—1st ditto, 10*). The Constitution of Maryland, said the counsel, thus limits the privileges of its legislative bodies (section 12). If the power of the House is admitted thus far, where did it get that power? It was said to be derived *ex necessitate rei* by the British Parliament. This was denied. The Constitution was the source to which the power must be traced, and it is not given there in express words.

Probably the fullest discussion of the power

\* An instance of this nature occurred, a few years ago, in the Lower House of the Ohio Legislature, from which a member, who had been a convict in the State Prison, was expelled.

† Cushing's "Elements."

of Congress to arrest and punish for contempt arose in the case of William Duane, editor of the "General Advertiser or Aurora," of Philadelphia. In his paper of February 19, 1800, he inserted some paragraphs defamatory to the Senate, and having failed in his appearance he was ordered to be committed.\* Suffice to say that each House of Congress has constantly exercised the power of arrest and commitment.

**CENSURE OF THE PRESIDENT.**—In the height of political excitement relative to the removal, by President Jackson, of the Treasury funds on deposit in the Bank of the United States, the Senate, on March 28, 1834, passed a resolution declaring that, in that proceeding, "the President had assumed upon himself authority and power not conferred by the Constitution and laws, but in derogation of both." This is the most extreme declaration which one branch of the Government has ever officially made on the conduct of another. It was a sentence of judicial weight uttered without a judicial investigation; and its personality was, perhaps, removed in a great measure by the fact that it was adopted by the strict vote of the opposing political party. A short time after the adoption of the resolution, President Jackson sent a protest to the Senate, declaring that "the resolution was in substance an impeachment of the President, and its passage amounts to a declaration, by a majority of the Senate, that he is guilty of an impeachable offense." After its presentation Senator Benton gave notice of a motion to expunge the resolution from the pages of the journal. The question he regarded as identical in all its features with the one growing out of the famous resolutions of the English House of Commons in the case of the Middlesex election, in 1768. The House was judged and condemned for adopting a resolution which was held by the subjects of the British crown to be a violation of their constitution and a subversion of their rights. It was expunged after fourteen years of annual motions. It was not until after three years that his motion (Benton's) was successfully presented in the Senate. It then became a resolution to expunge a portion of the record of a preceding Congress, and was carried into effect in the presence of the Senate, immediately after its adoption. Instantly a storm of hisses, groans, and vociferations arose from the left wing of the gallery. The order was immediately given to the Sergeant-at-Arms to seize the disturbers, and the ringleader was brought to the bar of the Senate. This example intimidated the rest.

During the administration of John Quincy Adams as President the question of a proposed mission to a congress of American nations, at Panama, came before Congress. No question, in its day, excited more heat and intemperate discussion, or more feeling between a President and Senate. Owing to some expression

used by John Randolph, in a speech in the Senate, Henry Clay, then Secretary of State, sent to him a challenge. The answer ran thus: "Mr. Randolph accepts the challenge of Mr. Clay. At the same time he protests against the *right* of any minister of the Executive Government of the United States to hold him responsible for words spoken in debate, as a Senator from Virginia, in crimination of such minister, or the administration under which he shall have taken office." Mr. Clay had been erroneously informed that Mr. Randolph waived his privilege. The matter was kept secret until the affair was over, without injury to either, and the Senate took no notice of it.

On occasions such as arise at almost every session, when the passage of a bill is resisted by the minority, and it becomes rather a question of physical endurance, the daily session is often protracted to a late hour of the night, or until the next day. The absentees are often arrested and brought in by the Sergeant-at-Arms, and, in some instances, fines have been imposed, and subsequently, on a satisfactory explanation, they have been remitted.

**LIMITATIONS OF THE FREEDOM OF SPEECH.**—The freedom of speech is regarded as the highest prerogative of a member of a legislative assembly; nevertheless, some arbitrary limitations have been placed upon it in the House of Representatives. The first of these is the previous question. When a motion is made for the previous question, and it is ordered by a majority of members sufficient to form a quorum, it has the effect to cut off all debate, and bring the House to a direct vote upon the immediate question, or questions, on which it has been asked and ordered. It may be asked and ordered upon a single motion, a series of motions allowable under the rules, or an amendment or amendments, or may be made to embrace all authorized motions or amendments, and include the bill to its engrossment and third reading, and then, on renewal and seconding of the motion, to its passage or rejection. Two or three attempts have been unsuccessfully made to adopt in the Senate a rule authorizing a call for the previous question.

An apparent limitation of the freedom of speech is to be found in the rule that "no member shall speak more than once to the same question without leave of the House, unless he be the mover, proposer, or introducer of the matter pending, when he may reply after all other members who wish have spoken." It is safe to say that this rule, in practice, causes no real limitation in the freedom of speech. The House has invariably manifested a willingness to listen to important remarks of members. A rule of the Senate provides that "no Senator shall speak more than twice upon any one question in debate on the same day without leave of the Senate."

Another more serious restriction on the freedom of debate in the House of Represent-

\* "Manual of Parliamentary Practice," by Thomas Jefferson, p. 18.

atives was the adoption of the hour rule, "the largest limitation on its freedom which any deliberative assembly ever imposed upon itself, and presents an eminent instance of permanent injury done to free institutions in order to get rid of a temporary annoyance." \* It was moved on July 8, 1841, as an amendment to the body of rules; and, at the same moment, the previous question was moved and carried. The vote was immediately taken, and the rule established.† The following observations were made by the distinguished Senator Thomas H. Benton, on the nature of this measure:

Certain it is that with our incessant use of the previous question, which cuts off all debate, and the hour rule, which limits speech to sixty minutes (constantly reduced by interruptions); the habit of fixing an hour at which the question shall be taken, usually brief, and the intermediate little time not secure for that question—with all these limitations upon the freedom of debate in the House, certain it is that such an anomaly was never seen in a deliberative assembly, and the business of a people never transacted in the midst of such ignorance of what they are about by those who are doing it.

No doubt the license of debate has been greatly abused in our halls of Congress—as in those of the British Parliament; but this suppression of debate is not the correction of the abuse, but the destruction of the liberty of speech; and that, not as a personal privilege, but as a representative right, essential to the welfare of the people. For fifty years of our Government there was no such suppression; in no other country is there a parallel to it. Yet in all popular assemblies there is an abuse of the liberty of speech, inherent in the right of speech, which gives to faction and folly the same latitude as to wisdom and patriotism. The English have found the best corrective: it is in the House itself—its irregular power; its refusal to hear a member further when they are tired of him. A significant scraping and coughing warns the annoying speaker when he should cease; if the warning is not taken, a tempest drowns his voice; when he appeals to the chair, the chair recommends him to yield to the temper of the House. A few examples reduce the practice to a rule, insure its observance, and work the correction of the abuse without the destruction of debate. No man speaking to the subject, and giving information to the House, was ever scraped and coughed down in the British House of Commons. No matter how plain his language, how awkward his manner, how confused his delivery, so long as he gives information he is heard attentively; while the practice falls with just and relentless effect upon the loquacious members, who mistake volubility for eloquence, who delight themselves while annoying the House; who, insensible to the proprieties of time and place, take the subject for a point to stand on, and then speak off from it in all directions, and equally without continuity of ideas or connection of words.

The measure having succeeded in the House, an attempt was made to adopt it in the Senate. Upon its failure, an unsuccessful effort was made to introduce the previous question.

**PAIRING OFF.**—In 1840 a practice was commenced in the House of Representatives, which has since been designated by the words "pairing off": two members of opposite political

parties agree to absent themselves from the duties of the House, without the consent of the House, and without deducting their per diem pay during the time of such voluntary absence. They do as they please—either remain in the city, refusing to attend to any duty, or go off together to neighboring cities; or separate, one staying and one going; and the one that remains sometimes standing in his place, and telling the Speaker of the House that he had paired off, and so refusing to vote. When the first instance of such a statement occurred, ex-President John Q. Adams, who was then a member of the House, immediately proposed the adoption of the following resolution: "Resolved, that the practice first openly avowed at the present session of Congress, of pairing off, involves, on the part of the members resorting to it, the violation of the Constitution of the United States, of an express rule of this House, and of the duties of both parties in the transaction, to their immediate constituents, to this House, and to their country." This resolution was placed on the calendar to take its turn, but, not being reached during the session, was not voted upon. This practice was soon after established also in the Senate.

A want of space will not permit further consideration of the disciplinary power of Congress, although the subject of the rules of Congress may be said to be continued in the subsequent remarks on the rules of the Parliament of England. Suffice it to say that the rules of legislative proceedings in the United States are essentially the same as those of the British Parliament, from which they have been derived; although, to meet the circumstances of Congress and the legislative assemblies of the States, they have been, in some cases, changed, differently applied, or extended beyond their original intention. Thus in each State the general system of rules is in some features different from the others, yet all are founded upon the essential principles of parliamentary law. (See POWERS OF CONGRESS OVER WITNESSES.)

**ENGLAND.**—The parliamentary system of England is one of the oldest in the world, and its present state is the development of this long period. Blackstone says, "As every court of justice has its laws and customs, some the civil or canon law, others the common law, and others still, special laws and customs, so the high court of Parliament has its general and special laws, which are called the law and practice of Parliament." The procedure of Parliament is based alike on law and custom, and is established in part by precedents, in part by permanent rules and those which are temporary, and finally upon statutes and prerogatives of royalty.

**RULES OF PARLIAMENT.**—Parliament has always attached great importance to precedents, both to demonstrate the existence of its privileges and to fix its rules of procedure; and whenever a dispute arises relative to them,

\* Thomas H. Benton's "Thirty Years in the Senate."

† In its present form, the rule is the last clause of section 2, Rule XIV: "No member shall occupy more than one hour in debate on any question in the House, or in committee, except as further provided in this rule." That is, a member proposing a measure may open and close, occupying an hour at each, if the general debate extends beyond one day.

either with the crown or between the Chambers, it has been the usage to appoint a committee to search for precedents on the subject in question. The standing orders of Parliament are the rules and forms of procedure which have been established from time to time as necessity required. They continue in full force under each Legislature until they are formally repealed. Of these fixed and invariable rules it has been said that "only their strict observance can protect effectually minorities from the abuse and excesses which the intoxication of power can too easily suggest to majorities that are powerful and blinded by fortune." The orders of the session are of less constitutional importance, and are renewed at each session and obligatory only during the session.

The rules of the two Houses are so numerous and of such variety that a classification of them would be quite difficult. Mr. May\* has attempted it by dividing them into two classes—one, comprising those which apply to a member when making a speech; and the other, those which apply to the House. When making a speech, a member can not refer to other debates of the same session, or speak of a bill which is not the order of the day, nor attack a decision of the House, or discredit it; nor allude to discussions in the other House of Parliament; nor use the name of the Queen irreverently, or for the purpose of influencing the debate; nor apply unjust or offensive words to either House, or to their acts; or to certain portions or members of the House in which he is speaking. Regarding the latter, it has been decided to be out of order to say that a member is "loose" in his assertions, or that by his vote he makes himself an advocate of riot and disorder, or is discourteous; or to quote from a journal where it is said that the loyalty of a member is rather a subject for caution, or to ask of a member, for the second time, a question which he has already answered.† No one will be surprised to learn that these rules have not been scrupulously observed, nor how easily they can be violated. In fact, this has been done so often that it has become habitual to elude them by the aid of oratorical artifices or transparent ambiguities. Indeed, although there is no rule of such high importance as the one relating to the relations of the two Houses, yet there is no one that is violated more frequently or with greater impunity.

**LANGUAGE OFFENSIVE TO THE OTHER HOUSE.**—It is otherwise if the language of the speaker is openly offensive to the other House. Such an error should be immediately suppressed, as likely to reach the consideration of Parliament and produce serious dissatisfaction. For this reason the speaker is required on the spot to retract or explain his words, and to offer to the

assembly satisfactory excuses. If he refuses, he incurs vigorous disciplinary penalties. An interesting example of this sort is related by Mr. May.\* "In 1614 the Bishop of Lincoln, Richard Neile, used expressions against the House of Commons which it regarded as offensive, and therefore sent a message of complaint to the House of Lords. The latter replied that the bishop had solemnly protested, on the salvation of his soul, that none of his words had been stamped with malevolent intentions toward the House of Commons; that his protestation had been made with real sentiments of lawful respect and high esteem, and that he had, at the same time, shed tears abundantly, and expressed his grief that his speech had been so misinterpreted and in sense gone far beyond his thought; and further, their lords regarding as satisfactory, this conduct at once so sincere and so humble, assured the House of Commons that if they had understood the language of the lord-bishop as containing imputations of sedition, they would have incontinently stigmatized and chastised him with all desirable severity."

**PERSONALITIES.**—To remove from the debates all appearance of personality, special rules, in each House, prescribe the manner in which each member shall be addressed so as to present simply his official character. Similar rules are in force in each House of Congress of the United States. These are observed not only between political friends but also between political opponents. In the Upper House each lord is designated by the rank he holds, and in the Senate each Senator is designated by the State he represents. A similar designation is given to each member of the House of Representatives; whereas in the House of Commons the member is designated as the member from the district which he represents. If these customs are forgotten by any member in the warmth of debate, and he utters insulting expressions, or unjust imputations, or accuses another of insincerity, or treachery, or evil designs, he will be promptly repressed.

Disorderly words should be immediately noticed, and if a member expresses a desire that action should be taken, the Speaker orders the Clerk to take them down, if it appears that such is the wish of the House. But there is a rule of the House of Commons, that if any member has spoken, or other business intervened, after offensive words spoken, they can not be taken notice of for censure. This is for the common security of all, and to prevent mistakes which must happen. In 1807 the Speaker decided that he could not notice words spoken by Mr. Duigenan, although Lord Howick had immediately risen for a call to order, because another member and the speaker himself had spoken before the House manifested a desire to act on the opprobrious words. Many later instances have occurred. In each House of Congress it is required that the exceptionable words shall

† M. A. Eynart, a member of the House of Representatives of Belgium, has investigated this subject extensively, and his articles, to which we are indebted, appear in the "Revue Générale" of Brussels.—Ed.

\* "Parliamentary Practice."

be immediately taken down in writing that the presiding officer may be better enabled to judge. Instances have recently occurred.

**RULES FOR BETTER ORDER.**—For the better order of the House of Commons, members are required to remain in their places during debate, to enter and go out with decorum, not to cross the House in an improper manner, nor to read books, journals, or letters, nor to break silence, nor hiss or make interruptions. In the House of Representatives of Congress a similar rule requires that, "while the Speaker is putting a question or addressing the House, no member shall walk out of or across the hall, nor, when a member is speaking, pass between him and the Chair; and during the session of the House no member shall wear his hat, or remain by the Clerk's desk during the call of the roll or the counting of ballots, or smoke upon the floor of the House; and the Sergeant-at-Arms is charged with the strict enforcement of this rule." Nevertheless, these rules of the House of Commons are not absolute. It is admitted that the reading of books and journals is not interdicted, when the object is to pass the time agreeably. It is also permitted to speak in a low voice or whisper, and the Speaker will not interfere upon repeated cries of "order," unless the noise of conversations disturbs the debate. So also with regard to hisses, exclamations, or other interruptions, the rule is very often violated. It is not rare to perceive great disorders, which can scarcely be repressed, during the tumult of five or six hundred members waiting with impatience a division of the House. One instance is reported, that a member "crowed like a cock." Nor is the prohibition against interruptions more absolute. These consist in words which can be uttered during debate that do not constitute an infraction of parliamentary rule, yet, by their frequency, and the noise which they occasion, they are very often a cause of disorder. The cries of "Question! question!" "Hear! hear!" have by long tolerance received a sanction in the two Houses of Parliament. The last expression, uttered at the end of a phrase, does not, properly speaking, constitute an interruption. It signifies generally approbation, and is addressed to the orator as a compliment or an encouragement. But such is not always its character or signification; according to the intention of its author, or the intonation of his voice, it can express either disapprobation, derision, or contempt. If it is spoken in the midst of a phrase, or with a shout, it will, more than any other interruption, offend and trouble the orator. At a session on August 6, 1878, Mr. O'Gorman, a member from Waterford, cried, "Hear! hear!" twenty times, during the speech of Colonel Stanley. He was ordered to leave the House, and not allowed to resume his place on the 7th, but on the prayer of his friend Mr. Sullivan. He asked pardon of the House and of the member speaking, and further proceedings were dropped.

**DISCIPLINE FOR VIOLATIONS OF ORDER.**—The disciplinary power of the House of Commons over its members for violations of order is very extensive. The lords are equal in rights, and the president has not been made the judge or guardian of order. But numerous precedents show that both Houses of Parliament have the right to condemn and to imprison for contempt or disobedience of orders, and for breach of privilege. Nor can the prisoner obtain liberty by an appeal to the courts, which have been obliged in such cases to declare that they had no jurisdiction. But while the Upper House has unlimited power, the Lower House can detain a prisoner only until the adjournment of Parliament. He is, however, subject to costs, which are sometimes very heavy. Most frequently the prisoner is released after a short time, either upon his expression of regrets, or upon the request of a colleague. The arrest has often been made to calm the excitement of angry debaters, or to prevent provocations or violence which, it is apprehended, may ensue. On December 10, 1766, words of dangerous freedom having been exchanged between the Duke of Richmond and Lord Chatham, the House of Lords exacted from them a promise, upon their honor, that nothing further should come of their resentment. In 1780 the same House, having learned that Count Pomfret had sent a challenge to the Duke of Grafton, for a cause entirely foreign from parliamentary debates, declared the Count guilty of high contempt toward itself, and imprisoned him in the Tower of London. So, in the House of Commons, if a member refuses to withdraw his insulting words, or the one offended declines to accept the offered excuse, in order to prevent other consequences from the quarrel, both are delivered to the custody of the Sergeant-at-Arms, and do not recover their liberty until they have given to the House an assurance not to resort to any act that would cause regret. In 1780 a dispute arose between Mr. Fox and Mr. Wedderburn, and the former having threatened to leave the House, the Speaker ordered the Sergeant-at-Arms to close all the doors, so that neither of them could go out until they had passed the sponge over their difficulty. A similar occurrence took place in 1836. Sir Frederick Trench and Mr. Rigby Wason being committed to the custody of the Sergeant-at-Arms, were not allowed their liberty until they had given the assurance that their quarrel was ended. The last case of the imprisonment of a member of the House of Commons occurred in 1852. It soon became known, however, that the member, condemned for lack of respect and for acts contrary to order, was insane, and he was placed in an asylum. There remains the case of absentees on a call of the House, who are unable to give a justifiable excuse. This occurs at every session, and is regarded as an act of contempt or disobedience, for it is the constitutional duty of each member of Parlia-

ment to be present in the House to which he belongs.

**PENAL POWER OF THE HOUSE.**—The penal power of the House of Commons extends beyond reprimand or detention; it has the right to exclude from its presence. This right has never been exercised by the House of Lords. It has been questioned by Blackstone, in the first edition of his "Commentaries," but it has been formally established by many precedents. In 1641 Mr. Taylor was expelled, and sentenced to perpetual ineligibility. In the same year Mr. Benson was judged to be always unfit and incapable to hold a seat in Parliament, or to be ever after a member of that House. During the Long Parliament elective disqualification was frequently made a ground for exclusion. At the Restoration in 1660, the House went so far as to join with a decree of expulsion against Mr. Wallop the declaration that he should be henceforth incapable of performing any public service or holding any office in the kingdom. When sentence was to be pronounced on a member, he was placed before the "Bar

Wilkes and assaulted the sheriffs who were charged with the execution of the order, snatched from the flames the unburned sheets of the horrid "North Briton," and bore them in triumph to Temple Bar, beyond the limits of the jurisdiction of the city, and there raised a bonfire into which they threw the remnants of the "North Briton," a bundle of boot-tops, and a petticoat, which were favorite emblems of the last and unpopular minister, Lord Bute. Instead of taking compassion on the follies of the crowd, the House got angry. Wilkes, fearing its wrath, refused to obey its command to appear in his place in Parliament, fled to Paris, surrounded by a pack of spies and exposed to every sort of misery. He was adjudged guilty of contumacy, and condemned to expulsion from Parliament. These events occurred in 1764. On the dissolution of Parliament in 1768, Wilkes returned from his exile and offered himself as a candidate for the City of London. He was defeated, but the remembrance of his misfortunes awakened the sympathies of the people in his favor, and he be-

THE BAR OF THE ENGLISH HOUSE OF COMMONS.

[At the lower end of the floor, beyond the seats of the members, is a line not to be passed, while the House is sitting, by any person who is not a duly elected representative of the people. A brass rod, which slides to and fro across the open space beside the chair of the Sergeant-at-Arms, can be interposed, upon proper occasions, to exhibit the line of demarkation. This is "the bar of the House," to which persons may be summoned, as to the bar of any other high court or tribunal, if there be cause to bring their conduct or their testimony into question.]

of the House," and, in early days, upon his knees. But the practice of kneeling has been long abolished.

**CASE OF JOHN WILKES.**—The last instance in which this exorbitant claim was exercised by the House of Commons was in the repeated expulsion of John Wilkes during the reign of George III. He was an editor and member of the House. He published a little work containing harsh attacks upon the King and his ministers. Forgetful of its privileges, and eager to gratify the royal malice, the House declared the writing of Wilkes to be "a false, scandalous, and wicked libel," and ordered its destruction by fire and by the hand of the public executioner. The populace took up the cause of

came their idol. Without delay he was elected a member from Middlesex by a strong majority. Many accidents, marked by bloody collisions between the people and the military, followed that election. Wilkes published another article against the minister, in which he branded as a "hateful murder" the violent repression of the risings of the people. Turning a deaf ear to the urgent reasons set forth with rare eloquence by Messrs. Burke, Pitt, and George Grenville, the House was obstinate in its conduct, at the time impolitic and hazardous, and declared the second article to be an "insolent, scandalous, and seditious libel," and deliberately voted, by a large majority, the repeated expulsion of Wilkes, and to bind for the second

time the brow of the author with the crown of a martyr, and stubbornly to trample under foot the most incontestable rights of the electors. As Mr. Grenville had predicted, Wilkes was re-elected without opposition. On the next day the House decided that, "having been expelled at this session, he had become and was incompetent to be elected or to sit in the present Parliament." Consequently the election was annulled, but Wilkes was chosen again without opposition and by an increased majority. Then, in order to prevent the fruitless trials, an expedient was devised. Another member of Parliament obtained from the Chancellor of the Exchequer the appointment of "Steward of Chiltern Hundreds," and put himself on the lists against Wilkes. Having been defeated, Mr. Luttrell addressed to the House a protest against the election of his opponent. The House decided that, notwithstanding Wilkes had obtained a majority of the votes—he had received eleven hundred and forty-three votes against two hundred and forty-four—it was Mr. Luttrell who should be declared to be elected, and the count was changed to that end. In vain the electors of Middlesex protested; in vain Burke and Grenville addressed the House with most indignant utterances—it persisted in its decision. The popularity of Wilkes immediately increased in immense proportions; he was elected an alderman of the City of London and a subscription was raised to pay his debts. At the same time a formidable opposition arose against the House of Commons, not only in the judiciary departments, where protests were made in the name of law and right, not only in the House of Peers, where Lord Chatham denounced with his powerful voice the injustice to the electors of Middlesex, but even in their hall George Saville made two efforts, at the risk of his own liberty, to accuse the House of having betrayed the rights of the people. But it was a useless labor; the House continued stubborn in its blind resistance. The City of London, through its magistrates, addressed the King in language stamped with unexampled boldness, showing that "the majority of the House of Commons had deprived the people of their dearest rights," and demanding that the King should consent to restore constitutional government and public tranquillity by dissolving the Parliament and removing from his councils the bad ministers. The King replied that he regretted that any of his subjects had been so far misled as to address to him remonstrances which were disrespectful to himself, injurious to Parliament, and incompatible with the principles of the Constitution. But this new denial of justice did not silence the opposition. Lord Chatham wrote that "no document had ever come from the throne more unconstitutional or more dangerous if it was permitted to pass without a reply." Finally, after incessant efforts repeated at each session by Burke and Saville, after a new Parliament had been chosen and

Wilkes re-elected, the House of Commons, overcome by the evidence of its wrongs as much as by the denunciations of the public, pronounced its own condemnation by opening its doors to Wilkes after eighteen years of proscription, and by erasing from the record its own decision on the subject of ineligibility, as subversive of the rights of the whole electoral body of the kingdom.

**EXPULSIONS.**—Under the later practice of Parliament, according to May, expulsion is generally for such breaches as render a member incapable of holding his seat, and as would injure the respect of Parliament, if they were permitted to pass without punishment. Members have been expelled who had been engaged in rebellion, or were guilty of forgery, perjury, deception, treason, prevarication in judicial office, or in the exercise of their duties as members of the House, or for acts unbecoming an officer and a man of honor, or for injurious writings, or for deeds directed against the House itself. But, at present, great prudence is observed in the exercise of this power. The history of the last three centuries shows that the penalties of Parliament have been successively modified under the influence of manners and political progress. In 1838 O'Connell was charged with accusing, in a public meeting, many of his colleagues as guilty of shameful perjury in the discharge of their duties on an electoral commission. He acknowledged that he had used the expressions, and was declared to be guilty of a violation of privilege, and by a resolution of the House was punished simply by a reprimand from the Speaker. Other instances could be mentioned, but our limits will not permit.

**THE CLÔTURE.**—The *clôture*, or the adoption of some rule by which all debate on a question may be closed, and the House brought to a direct vote, has excited the attention of the English public for some years. Scarcely a session of the Congress of the United States has been held during many years without an effort on the part of the minority in one of the Houses, and usually in the House of Representatives, to defeat the passage by the majority of some important bill, or to secure a special amendment to the same. The bill is generally looked upon by the minority as politically very objectionable, or as containing some very objectionable features. If brought to a final vote it would be quickly passed by the majority, and the object of the minority is to prevent its reaching that vote at all, or until some important amendments have been conceded. Near the close of the session the bill is called up for further consideration, or for its final passage, and the minority commence their efforts for its delay, or defeat, or "obstruction," as it is called in the House of Commons. These consist in numerous speeches, motions to adjourn, on which the yeas and nays are called, and an unlimited number of amendments, each of which can be discussed and voted upon as a distinct question.

There is no termination to such proceedings except through the physical exhaustion of the contestants, or concessions on the part of the majority.

In the session of Parliament of 1877, seven members from Ireland introduced the method resorted to in the Congress of the United States. Their object was to obstruct or to arrest the legislative machinery, and thus demonstrate the absolute necessity of a national Parliament for Ireland. It was in the month of July, and about three weeks remained of the session, and the question was on a bill relating to South Africa. Mr. Parnell, the member from Meath, took the lead, O'Donnell and Biggar followed

for the rights of minorities and for individual liberty, that it experienced a sense of relief when it was understood that Sir Stafford would not propose any measure of coercion, "as the House was the best judge of its dignity."

During the sessions of 1878 and 1879 similar obstructive measures were used, with far greater skill. At the close of the latter, the London "Economist" said:

So far as relates to general legislation, the obstructionists have made the year entirely unproductive. They have pushed the ministers and the members of the House to such a pitch of impotent rage that their satisfaction should be very great; and through it all, they have acted without any violation of order which could furnish to a watchful and angry majority an occasion, so much desired, to use retaliatory measures.

In 1881 Ireland was extremely agitated. Secret associations covered the land, and crimes against life and property were multiplied beyond measure. In this state of affairs Mr. Gladstone had Parliament convoked one month in advance of the appointed date. Through the action of Mr. Parnell and his colleagues, three weeks were exhausted in an unusual debate on the address in answer to the Queen's message. Mr. Gladstone then brought forward his "coercion bills" for Ireland (Protection of Person and Property Bill, and Peace Preservation Bill). These bills afforded to the House an opportunity to give another illustration of that patience, of that strength of resistance, and of that respect for liberty, which are the foundation of the English character.

The discussion of the bills began on January 25th, at 4 p. m., and the members from Ireland at once entered upon the contest. By the aid of the Speaker, Mr. Gladstone was able to set forth reasons of urgency, which became the question. The

SIR STAFFORD NORTHCOTE SUGGESTS THE SUSPENSION OF MR. PARNELL.

near; afterward came Kirk, Gray, Nolan, and Power, always active, always ready to take the place of those whom an excess of fatigue had obliged to retire for a moment to refresh their wearied powers. The sessions commenced at 4½ o'clock p. m. That of July 24th continued until 2½ a. m.; that of the 25th continued until 6 a. m.; and that of the 31st until 6½ p. m. of the next day. Mr. Parnell and Mr. O'Donnell alone spoke hundreds of times and offered an avalanche of amendments. Mr. O'Donnell had prepared seventy-three; some were identical with propositions already rejected by a formal vote.\* During the session of July 31st, Sir Stafford Northcote suggested the parliamentary suspension of Mr. Parnell for some days. But so great is the respect of the English people

session continued until 2 p. m. of the 26th; it next commenced on the 27th, and adjourned on the 28th; but that of January 31st was the longest. It commenced at 4 p. m. on Monday, and had continued until 9½ a. m. of Wednesday, when Mr. Gladstone entered the House and was greeted with enthusiastic applause. The ministerial benches were immediately filled, the Speaker resumed the chair in place of the deputy Speaker, and immediately addressed the House. Alluding to the condition in which they were placed, and that an important measure, recommended in the speech from the throne a month previous, and declared urgent for the interest of the state by a decisive majority, had been held in check by an insignificant minority, which had resorted to a mode of "obstruction" rated as a parliamentary offense by the assembly, he

\* To furnish a fuller view of the exciting occasion, three sketches from the London "News" are inserted.

said: "A new and exceptional proceeding is imperiously demanded, and I am convinced that I shall better respond to the intentions of the House to refuse permission to any more speakers, and to put the question to vote." The vote was then taken on the introduction and first reading of the "coercion bills," amid incessant and excited cries, by the nineteen Irish members, of "Privilege!" "Privilege!" Mr. Gladstone immediately announced that on the next day he would make the following motion: "When a motion to declare urgency in the state of public business shall have been made, if forty members rise to sustain that proposition, the President shall immediately take the vote of the House on the question. In case the number of 'yeas' shall be larger, a vote by division shall be immediately taken, and if the majority in favor of the proposition is at least three fourths, the powers of the House for the determination of the proceedings during the different stages of a bill shall be delegated to the Speaker, and remain in his hands until he declares there is no longer urgency in the state of public business." These proceedings closed the session of forty-two hours.

At the session which was held in the afternoon, the Speaker was asked what provision of the rules he had executed in closing so hastily the debate. He replied that he had acted on his own responsibility to discharge a duty to the House. A resolution was offered by Mr. Parnell, "that the conduct of the Speaker was a violation of the privileges of the House." The Speaker said it was a question of order and not of privilege, and that there should have been a previous notice of the resolution. In the discussion that ensued the Speaker was sustained by the House—278 votes to 44. The act of the Speaker was practically a *coup d'état*. It would be necessary to search very far back in the history of England to find a similar act, thus violating all traditions, thus repudiating all precedents, and putting one's self in a very flagrant manner in contradiction to the very idea of British liberty:

"Ours is a land of old renown,  
Where freedom slowly broadens down,  
From precedent to precedent."

At the session on the next day fixed for the introduction of Mr. Gladstone's proposition, the House of Commons was invaded by the House of Lords and princes of the royal family. Scarcely had he said a few words, when he was interrupted by Mr. Dillon, one of the Irish members, on a question of order. Amid cries of "Order!" "Order!" on every side, Mr. Dillon said, "Mr. Speaker, I claim my privilege." Whereupon the Speaker decided that he had voluntarily failed in respect for the authority of the Chair. Amid the uproar Mr. Gladstone was heard to say, "I move, conformably to the rule, that Mr. Dillon be suspended from service in this House for the remainder of the session." The Speaker imme-

diately put the question, and the yeas, like a formidable explosion, made the vault of Westminster tremble. The nays were feebly heard. The result was disputed, and a division was

MR. PARNELL OFFERS HIS RESOLUTION.

required. A vote nearly unanimous was given against Mr. Dillon. He refused to retire. The respectable Sergeant-at-Arms then invited him to go. He still refused. The sergeant then touched his arm, but this was not sufficient. Four assistants soon appeared, ready to remove the rebellious member, who, in going out, turned his back to the Speaker, instead of making the usual mark of reverence. No sooner was this scene over, than Mr. Gladstone began to speak, when he was immediately interrupted by Mr. Parnell, and the same scene was repeated. This continued until nine other members were led out, each one protesting against the "illegal and despotic force" to which he was subject. It was 8½ p. m. when the last was out. At 2 a. m. the bill granting extraordinary powers to the Speaker was passed, and urgency was declared, which invested him with those powers.

Nevertheless, these exceptional powers were

insufficient. The "Home-Rulers," as they were called, misled for an instant, soon recovered their way. Scarcely was the *régime* of urgency in force, when Mr. Gladstone anew launched forth bitter complaints at the slow progress of the debate, and called for an increase of measures to hasten its course. Thus the session closed with a formal notice of resolutions to be presented at the following session in October.

The autumn session commenced on October 24, 1882, and Mr. Gladstone brought forward his resolutions as business that had devolved on the Government. He said: "It was generally admitted last year that the efforts of the

of motions, on every day for which they are set down.

It will be seen that the justification put forth by Mr. Gladstone for the action of the Government in taking part in this matter is founded on the *doctrine of necessity*. The affairs of the British Empire, he says elsewhere, "by its extension and concentration, have put a frightful charge upon Parliament, so that this question becomes one of life or death." This doctrine of necessity furnishes always the last reason for a usurpation of power.

The rules of procedure were discussed for a month, and adopted. The following is the text of these new rules:

MR. GLADSTONE BRINGS FORWARD HIS RESOLUTIONS.

House to adjust this matter by conference for themselves in a long series of years had been futile and ineffectual, and that it remained to be considered whether, by putting into operation that degree of influence which the House is always inclined for the public interest to accord to the Government of the day, it might be possible to put the question into a channel which would be more likely to lead to a successful issue." He concluded his speech by moving that the new rules of procedure have precedence of all orders of the day and notices

## I.—PROCEDURE.

### PUTTING THE QUESTION.

1. That when it shall appear to Mr. Speaker, or to the chairman of Ways and Means in a Committee of the Whole House, during any debate, that the subject has been adequately discussed, and that it is the evident sense of the House, or of the committee, that the question be now put, he may so inform the House or the committee; and, if a motion be made "That the question be now put," Mr. Speaker, or the chairman, shall forthwith put such question; and, if the same be decided in the affirmative, the question under discussion shall be put forthwith: provided that the question, "That the question be now put," shall not

be decided in the affirmative, if a division be taken, unless it shall appear to have been supported by more than two hundred members, or unless it shall appear to have been opposed by less than forty members and supported by more than one hundred members.

#### MOTIONS FOR ADJOURNMENT BEFORE PUBLIC BUSINESS.

2. That no motion for the adjournment of the House shall be made until all the questions on the notice-paper shall have been disposed of, and no such motion shall be made before the orders of the day, or notices of motions have been entered upon, except by leave of the House, unless a member rising in his place shall propose to move the adjournment, for the purpose of discussing a definite matter of urgent public importance, and not less than forty members shall thereupon rise in their places to support the motion; or unless, if fewer than forty members and not less than ten shall thereupon rise in their places, the House shall, on a division, upon question put forthwith, determine whether such motion shall be made.

#### DEBATES ON MOTIONS FOR ADJOURNMENT.

3. That when a motion is made for the adjournment of debate, or of the House, during any debate, or that the chairman of a committee do report progress, or do leave the chair, the debate thereupon shall be confined to the matter of such motion; and no member, having moved or seconded any such motion, shall be entitled to move or second any similar motion during the same debate.

#### DIVISIONS.

4. That, after the House has entered upon the orders of the day or notices of motions, when, after the House has been cleared for a division, upon a motion for the adjournment of a debate, or of the House during any debate, or that the chairman of a committee do report progress, or do leave the chair, the decision of Mr. Speaker or of the chairman of a committee that the ayes or noes have it is challenged, Mr. Speaker or the chairman may, after the lapse of two minutes, as indicated by the sand-glass, call upon the members challenging it to rise in their places, and, if they be less than twenty in a House of forty members or upward, he may forthwith declare the determination of the House, or of the committee.

#### IRRELEVANCE OR REPETITION.

5. That Mr. Speaker or the chairman of Ways and Means may call the attention of the House, or of the committee, to continued irrelevance or tedious repetition on the part of a member; and may direct the member to discontinue his speech.

#### POSTPONEMENT OF PREAMBLE.

6. That in committee on a bill the preamble do stand postponed until after the consideration of the clauses, without question put.

#### CHAIRMAN TO LEAVE THE CHAIR WITHOUT QUESTION.

7. That when the chairman of a committee has been ordered to make a report to the House, he shall leave the chair, without question put.

#### HALF-PAST TWELVE O'CLOCK RULE.

[Standing order of the 18th of February, 1879, amended the 9th of May and 20th of November, 1882.]

8. That except for a money bill no order of the day or notice of motion be taken after half-past twelve of the clock at night, with respect to which order or notice of motion a notice of opposition or amendment shall have been printed on the notice-paper, or if such notice of motion shall only have been given the next previous day of sitting, and objection shall be taken when such notice is called.

That motions for the appointment or nomination of standing committees and proceedings made in accordance with the provisions of any act of Parliament or standing orders, motion for leave to bring in bills,

and bills which have passed through Committee of the Whole House, be excepted from the operation of this order.

Provided that every such notice of opposition or amendment be signed in the House by a member, and dated, and shall lapse at the end of the week following that in which it was given.

Provided also that this rule shall not apply to the nomination of select committees.

#### ORDER IN DEBATE.

[Standing order of the 28th of February, 1880, as amended.]

9. That whenever any member shall have been named by the Speaker or by the chairman of a Committee of the Whole House, immediately after the commission of the offense of disregarding the authority of the Chair or of abusing the rules of the House, by persistently and willfully obstructing the business of the House, or otherwise, then, if the offense has been committed by such member in the House, the Speaker shall forthwith put the question, on a motion being made, no amendment, adjournment, or debate being allowed, "That such member be suspended from the service of the House"; and, if the offense has been committed in a Committee of the Whole House, the chairman shall, on a motion being made, put the same question in a similar way, and, if the motion is carried, shall forthwith suspend the proceedings of the committee, and report the circumstance to the House; and the Speaker shall thereupon put the same question, without amendment, adjournment, or debate, as if the offense had been committed in the House itself. If any member be suspended under this order, his suspension on the first occasion shall continue for one week, on the second occasion for a fortnight, and on the third, or any subsequent occasion, for a month; provided always that suspension from the service of the House shall not exempt the member so suspended from serving on any committee for the consideration of a private bill to which he may have been appointed before his suspension; provided also, that not more than one member shall be named at the same time, unless several members, present together, have jointly disregarded the authority of the Chair; provided always, that nothing in this resolution shall be taken to deprive the House of the power of proceeding against any member according to ancient usages.

#### DEBATES ON MOTIONS FOR ADJOURNMENT.

10. That if Mr. Speaker or the chairman of a Committee of the Whole House shall be of opinion that a motion for the adjournment of a debate or of the House during any debate, or that the chairman do report progress, or do leave the chair, is an abuse of the rules of the House, he may forthwith put the question thereupon from the chair.

#### CONSIDERATION OF A BILL, AS AMENDED.

11. That when the order of the day for the consideration of a bill, as amended in the Committee of the Whole House, has been read, the House do proceed to consider the same without question put, unless the member in charge thereof shall desire to postpone its consideration, or a motion shall be made to recommit the bill.

#### NOTICES ON GOING INTO COMMITTEE OF SUPPLY.

12. That, whenever the Committee of Supply stands as the first order of the day on Monday or Thursday, Mr. Speaker shall leave the chair without putting any question, unless on first going into supply on the army, navy, or civil-service estimates respectively, or on any vote of credit, an amendment be moved or question raised relating to the estimates proposed to be taken in supply.

13. That the first seven and the last three of the said resolutions be standing orders of the House.

## II.—STANDING COMMITTEES.

## STANDING COMMITTEES ON LAW AND COURTS OF JUSTICE, TRADE, ETC.

1. That two standing committees be appointed for the consideration of all bills relating to law and courts of justice and legal procedure, and to trade, shipping, and manufactures, which may, by order of the House in each case, be committed to them; and the procedure in such committees shall be the same as in a select committee, unless the House shall otherwise order; provided that strangers shall be admitted, except when the committee shall order them to withdraw; provided, also, that the said committees shall be excluded from the operations of the standing order of July 21, 1856, and the said committees shall not sit while the House is sitting without the order of the House; provided, also, that any notice of amendment to any clause in a bill which may be committed to a standing committee, given by any honorable member in the House, shall stand referred to such committee; provided, also, that twenty be the quorum of such standing committees.

## NOMINATION BY COMMITTEE OF SELECTION.

2. That each of the said standing committees do consist of not less than sixty or more than eighty members, to be nominated by the committee of selection, who shall have regard to the classes of bills committed to such committees, to the composition of the House, and to the qualifications of the members selected; and shall have power to discharge members from time to time, and to appoint others in substitution for those so discharged. The committee of selection shall also have power to add not more than fifteen members to a standing committee in respect of any bill referred to it to serve on the committee during the consideration of such bill.

## APPOINTMENT OF CHAIRMAN.

3. That the committee of selection shall nominate a chairman's panel, to consist of not less than four nor more than six members, of whom three shall be a quorum, and the chairman's panel shall appoint from among themselves the chairman of each standing committee, and may change the chairman so appointed from time to time.

## COMMITMENT AND REPORT OF BILLS.

4. That all bills comprised in each of the said classes shall be committed to one of the said standing committees unless the House shall otherwise order, and, when reported to the House, shall be proceeded with as if they had been reported from a Committee of the Whole House; provided, that the provisions of Resolution 11 shall not apply to a bill rejected from a standing committee.

## DURATION OF RESOLUTIONS.

5. That the four preceding resolutions be standing orders of the House until the end of the next session of Parliament.

THE CLÔTURE IN FRANCE.—In France the *clôture* by a simple majority was not introduced into the rules of the French Legislative Assembly until after the *coup d'état* of December, 1851, when parliamentary government was practically abolished. Under the constitutional government of Louis Philippe, the President of the Chamber or House of Deputies exercised a good deal of authority in directing, limiting, and closing the debates, but this was derived more from custom than written law. Some were more overbearing in their nature and usurped authority; others were quite popular with the members, and their pressure was willingly endured. The president was always re-

garded as a moderator, whose business it was to check excessive garrulity and tediousness, but some have gone so far as to act like masters managing a class of pupils. President Dupin became noted for his arbitrariness. He was a jocular president,\* and hated bores, and often drove them from the tribune by sallies which kept the House in a roar, and which were often more witty than good-natured. A member with a weak voice happening to say that he hoped the whole of France would hear his words, Dupin called out, "You must speak louder than that, sir, if you want to be heard all over France." On another occasion, M. Abraham, deputy for Martinique, had ascended the tribune with a large bundle of notes. Dupin's face assumed a comical air of consternation, and he was heard whispering in a stage aside, "Come, Abraham, make a sacrifice!" The House acquiesced in the use of Dupin's tongue, and his influence in quickening and controlling the debates was immense, but it is noted that he never connived at silencing minorities. On the contrary, so long as the Opposition had anything to say, he insisted that they should have a patient hearing. One day a member of the Extreme Left had risen to speak in despite of an almost unanimous shout of "*Aux voix!*" ("Divide!") Dupin loudly rang his bell. "I really don't understand you, gentlemen," he said; "you are not bound to remain in your seats as I am. If you don't wish to hear the speech to which I am going to be treated, you can take a stroll in the lobbies. I'll send one of the ushers to tell you when the speaker has finished." Again, when Berryer, the great Legitimist orator, was making a fierce attack on one of Louis Philippe's ministers, Dupin, who was an intimate friend of his, though their opinions were antagonistic, exclaimed, "Monsieur Berryer, if you do not moderate your tone, I shall be obliged to call you to order"; but, leaning over his desk, he whispered in the orator's ear, "*Tape dessus!*" ("Pitch into him!") When Louis Napoleon had become master of France, all the regulations touching the new Corps Législatif were framed purposely to keep that body from becoming in any sense a Parliament. Its members were not allowed to initiate laws or resolutions; they might simply speak and vote on measures submitted to them by Government, and even their privilege of moving amendments was restricted by the proviso that no amendment should be debated upon unless it had received an *imprimatur* from the Council of State—a thing never vouchsafed in the case of Opposition amendments. The debates of the Corps Législatif were not public—that is to say, strangers were not admitted to hear them; and newspapers might only publish such condensed reports of them as were supplied by the official "Moniteur." Even these fetters on free speech, however, were not considered enough, and so the *clôture* was contrived as a final gag.

\* Correspondent of the London "Times," February 16, 1882.

The rule about it was that it should be moved for in writing by five members; and, when the motion was put from the Chair, a division was to be instantly taken upon it, unless any member claimed to speak against the motion. But any member so speaking was to limit his remarks strictly to the subject of the *clôture*, and no more than one member could be heard against the motion. The vote was to be taken in the usual way, *par assis et levé* (sitting or rising), unless there were a written demand signed by five members for a ballot; and a simple majority of the members present was enough to pass the motion. When the *clôture* had been voted, the president was bound to stop all further speaking on the main question, and to put that question immediately to the vote. Practically all formalities in moving for the *clôture* were dispensed with when there was an autocratic president in the chair. It became a regular habit with the Government majority to shout for the *clôture* as soon as they understood that ministers desired to silence the Opposition. The president would then say, "There is a demand for the *clôture*," and being answered by an acclamation from the benches of the Right, he would add, before any member of the Left had time to rise, "The *clôture* has been voted." On a certain memorable occasion M. Jérôme David, being in the chair, made so much haste in bringing a debate to a close that the Opposition rose in a body, clamoring that the regulations had not been complied with. M. David, disdaining to argue the point, retired from his chair, ordered the ushers to turn off the gas, and left the Opposition vociferating in the dark. The Opposition was at that time only 23 strong in a House of 360 members; and this is a point worth remembering, for it shows how tyrannically the *clôture* was misused for party ends.

GERMANY.—The Constitution of the German Empire contains a few general provisions relating to the Parliament. It provides especially that its sessions shall be public; that it shall verify the powers of its members; that its proceedings and modes of discipline shall be governed by a regulation or rule of order; that it shall appoint its president, vice-presidents, and secretaries; that a majority can entertain resolutions, but a majority of all the members elected is necessary for their valid adoption.

Excepting the constitutional restrictions, the authority of the Parliament is absolute; it is independent of any initiatory action or final ratification by the Federal Council or the Emperor. At different times the Parliament has exercised this power to modify its order of proceedings, which, borrowed in 1867 from the Prussian Lower House, was afterward adopted without change in the first regular session of the Parliament. Afterward, especially in 1868, 1869, 1870, 1872, and 1874, this regulation of order has been modified somewhat from the original. The Prussian *Landtag* slowly appropriated the definitive regulation,

and thus, excepting some small variations, the proceedings are the same in the two assemblies.

DIVISIONS.—The Parliament is divided by lot into seven sections, composed, as far as possible, of an equal number of members. Each section elects its president and secretary, and the substitutes for each. The sections continue to the end of the session, and they are not renewed by Parliament except on the request of thirty members. The sections have equal authority to choose special committees, of which there are two classes. The first class, six in number, are permanent, and embrace the subjects of regulation, of internal order, petitions, commerce and industry, finances and imposts, justice, and the imperial budget. Generally, only three of these committees are appointed—internal order, petitions, and the budget. The second class contains the committees for special objects. Like the sections, the committees elect their president, secretary, and reporter.

There exist in the Reichstag two other organs which deserve to be mentioned. The first is called (*Seniorenconvent*) Council of Elders. It is neither a special nor general committee, but a permanent body that without regulation comes together on the same day in each year, after the opening of the session. It owes its origin to the traditional custom of Parliament to create compromise committees among the different parliamentary groups in relation to their respective numerical representation. To that end each faction appoints one or more of its members to the Council of Elders, which determines, afterward, the proportionate number of members to accrue to each group in the committees. After the number is once fixed the sections designate the deputies who will belong to the committees. But this is not the only power of the Council of Elders; it may serve as a substitute for the Parliament in deciding the order of the day, and the regular dispatch of business. This function, as important as useful, which it has exercised hitherto without inconvenience or noise, has recently attracted to the Council of Elders the attention of Europe, and, what is certainly more grave, the anger of Mr. Bismarck. Under the foresight that after Pentecost it would not be possible to secure a sufficient number of members for business, the Council of Elders, in concert with the president, Count von Arnim, gave notice that it was expedient to close the session, and in consequence regulated the order of the day. This proceeding is repeated every year; and as the day of adjournment draws near a selection is made of the matters which are important, and they are put in the orders for the day, and the rest go over to the next session. Now, at the time above alluded to, the Council of Elders had taken the great liberty to include, in the business laid over, the bill providing for new taxes, which were indispensable to Mr. Bis-

mark to cover the increase of expenses resulting from the war.

The second organ is of a still more special character. It is a committee appointed by the president for each legislative period, and having charge of the management and care of the library.

**PROCEEDINGS.**—As in many other legislative assemblies, each bill has three readings, and when the debate is closed the vote is taken by sitting and rising. When the result seems doubtful, either to the president or one of the secretaries, it is repeated. If this is not decisive, a count is made. For this purpose the president requests the members to leave the hall. All the doors are then closed, except one on the east side and one on the west side of the hall. At each two secretaries stand, and on a signal the members enter and are counted, the affirmative by the east door and the negative by the west. On a signal, the vote is closed and the doors opened.

The article of the Constitution which required an absolute majority for the passage of resolutions originally contained an exception, that where the matter under consideration was not of common interest to the whole empire, it could be submitted to the votes of the deputies elected from the states of the confederacy which were concerned in it. But this special provision has yielded before the growing tendencies of centralization, and was abolished in 1873. At the same time the constitutional provision is interpreted in a restricted sense. It is applied only to resolutions of the Reichstag, and it has always been understood, in practice, that it did not extend to subjects of deliberation. The Parliament has even gone further, and allowed the question on resolutions to be taken, without regard to the number of members present, not only when these resolutions were without importance, but even more formal ones, where the decision was by rising and sitting.

**ABSENTEEISM.**—This is a serious evil in the German Parliament. This is especially true at the opening of the sessions, and at certain periods when several Diets convene at the same date with the Parliament. At a recent session the attendance was so small and so irregular that on several occasions the assembly was obliged to adjourn. On April 20, 1880, of 397 deputies that composed the Reichstag hardly fifty were present at the commencement of the sitting, and the number was not increased to the close. On April 24th not less than 254 failed to answer on the call, and it was stopped; at evening hundreds of telegrams were sent in all directions, through fear that on the morrow the same spectacle of empty benches would be presented. The presence of the Chancellor (Bismarck) at the debates, however, awakens curiosity, and fills the benches. It was therefore suggested, as a remedy for the evil, that he should be required to be present.

**ORDER OF SPEAKING.**—The rule of the Parliament does not require, like that of the Prussian Landtag, that a list of the speakers should be made, but any one can address the House on obtaining the assent of the president, who grants it to the deputy first to ask after the opening of debate, or after the close of any speaker. Neither is any alternation of speakers *for* and *against* a question required, as the debate is not limited, and one may speak many times on the same subject. Nevertheless, if there is no official list of the speakers, a roll of their names is still made before the debate opens, which is kept by one of the secretaries. This, however, has no validity in regulating the order of the speakers, which is determined by the practice of a number of sessions. The political parties specially interested in the debate determine in their preparatory meetings the deputies who are to speak in their name. These are written at the desk of the clerk, and the president of the group takes care to prevent the names afterward to the attention of the President of the House. This is sufficient to secure the opportunity for them to speak immediately after the authors of the questions. The president treats the names of speakers of other groups in the same manner, and assigns the liberty to speak, according to his judgment, or the necessities of the debate, to deputies who have been urgently recommended to him or with whose special qualifications he is acquainted, but in such a manner that a speaker for or against the question is alternately heard. After the first series of speakers has concluded, if the discussion is not exhausted, a second series of speakers is called in the same manner. The advantages and disadvantages of this practice can be seen at once. It elevates the debate above the hazards of the lists, and gives to the leaders of a party and the most distinguished or technical speakers an opportunity to address the House when it is disposed to give full attention. It is very favorable to the Opposition, since all the political groups are certain of an opportunity to present their dissenting opinions. But, in return, the equality of Parliament ceases to exist. At least, it becomes difficult for the common deputies to speak contrary to the understanding between the political leaders and the President of Parliament, as the close (*clôture*) is generally pronounced before their turn is reached. On the other hand, the discretionary power given to the president seems to be ill-suited to his duties.

The speakers can address the House from the tribune, or any place which they prefer. The rules relating to them require that, when one disturbs the order, the president shall call him by name. He can then make a written protest, whereupon the House at the following sitting will decide without debate if the call was just. If a tumult is raised in the House, the president can suspend the sitting for a fixed time or close it. If he can not make himself

heard, he covers himself, by which act the sitting is suspended for an hour. The rules in general are similar to those of other parliamentary bodies, such as introducing in debate the person of the sovereign, etc. Interruptions, although prohibited, are generally tolerated.

**NUMBER OF GROUPS.**—An interesting feature of the Reichstag is the great number of groups of which it is composed. These arise from the various social, religious, and political ideas which the deputies entertain, and result in depriving the House of any decisive majority. Bismarck recognizes only two parties in that body—the friends and the enemies of the Empire. The deputy Richter, addressing a body of Progressive electors in Berlin, said, “The Chancellor puts the Constitution topsyturvy, and accuses all those who do not obey him on the spot as the enemies of the empire.” All parties, even the Conservatives, have been subjected to this imputation, which has also been launched against the most remarkable men of the Parliament. It is a classification purely fictitious, and springs from the chagrin or strategic policy of Bismarck.

Commencing with the Conservatives, the first division is into German Conservatives and Liberal Conservatives, or party of the Empire. The first group is born of a fusion of two Conservative factions, the Old Conservatives and the New Conservatives, whom simple shadows have for a long time divided in their common attachment to the monarchy, and to the social and religious traditions of the state, and who are finally united in the purpose to oppose the most effective resistance to liberalism. The second group, as its name indicates, is composed of hybrid elements, taken confusedly from the ranks of the old Liberals and Conservatives, and bound together by ardent sympathies for the centralizing ideas of Bismarck. These Liberal Conservatives serve, so to say, for transition between the Conservatives and the National-Liberals, with whom they have often moved together. Liberalism, like conservatism, comprises two groups, of which the first contained recently, under the name of National-Liberals, the greater portion of the Progressist sticklers and the Democrats of different degrees, of the period of the war, who went over to Bismarck on the day after the battle of Sadowa, and became the chief supporters of his military, financial, and religious policy. The National-Liberals are really divided into two divergent factions. The second liberal group is composed of the rest of the Progressists who have adhered to the flag of radicalism since 1866. Above the Progressists and below the Socialists there is a handful of men equally devoted to radical ideas, and who, although adherents to the empire entirely, have their center of action at Frankfort-on-the-Main. These are the Democrats, whose leader is the editor of the “Frankfort Journal.” The Center holds a place apart in German politics. As far back as 1852 a Catholic faction was

formed in the Second Prussian House. It contained sixty-two members, who belonged chiefly to Westphalia and the Rhine Province. The Center extended itself from the Prussian *Landtag* to the Reichstag, where it received new recruits from the confederated states, after having its ranks increased in consequence of the *Kulturkampf* war.

Besides these parties, there are many others whose political significance is as restricted as their partisans are few. The Poles always unite with the Center; the Alsace-Lorraine members side with the Independents and Protestationists; the Hanoverian Particularists unite generally with the Center, and there is another fraction composed of extreme Independents and Progressists. The last group, insignificant in numbers, and more clamorous than all the others, is the Socialists. This party has been steadily advancing since 1870.

**GENERAL ASPECT.**—The German Parliament, in the opinion of M. Reynaert, is one of the most grave and agreeable of legislative assemblies, although it may not realize the ideal of quiet and decorum. He says: “During debate silence is not always strictly observed, especially during great oratorical contests, when the spirit sparkles and gushes dazzling from heated brains; the interjections, the interruptions, the exclamations of every sort, expressive of the most diverse sentiments, are *vive*, noisy, and often roaring. Nevertheless, it would be incorrect to pretend that, in this respect, the German Parliament was inferior to other great legislative bodies, especially the Prussian or Italian Assembly, and, above all, the French House of Deputies. In other respects the *Reichstag* is generally marked by calmness, dignity, and benevolence. Perfect freedom of opinion is allied with the most scrupulous respect for the views of another. The temper of the House is neither violent nor quarrelsome, and the discussion seldom reaches personality or invective. During the thirteen years of its existence there has not been a challenge to a duel, or a disturbance that has caused a suspension of the session. Yet that interval is full of events as decisive for Germany as of grave debates and irritating questions touching the heart of the nation. After the creation of the Confederacy of the North, the empire followed in consequence of a terrible war, Alsace and Lorraine were incorporated, and, after various efforts, reconstituted on a new basis; the seven years’ military law was established, many times renewed and aggravated; public taxes constantly changed and increased; the mercantile policy completely overthrown by the sudden substitution of protection for the mitigated revenue system; socialism attacked boldly and repressed at all points by measures of excessive severity; and last, but not least, the *Kulturkampf* and the odious laws imposed in its name upon the empire by Prussia.”

**DOMINION OF CANADA,** the united provinces of Ontario, Quebec, Nova Scotia,

New Brunswick, Manitoba, British Columbia, and Prince Edward Island, brought together under one Parliament under the British North America Act of the British Parliament in 1867. The act contains provisions for the admission of Newfoundland into the Dominion. The other parts of British America are administered as a Territory by the Dominion Government. The Parliament consists of a Senate with seventy-seven members, nominated for life by the Governor-General, and a House of Commons with two hundred and eleven members, elected for five years. The system of government is substantially the same as that of Great Britain. The suffrage is restricted in Ontario and Quebec to householders possessing or occupying real estate of \$300 assessed value, or of the yearly value of \$30, in cities and towns; or of \$200 value, or \$20 rental, in other districts. The other provinces have similar property qualifications. Voting is open except in New Brunswick, where it is by ballot. The executive authority is exercised by the Governor-General, under the advice of his Privy Council, in the name of the Queen. The seven provinces have each its local Parliament and its administration presided over by a Lieutenant-Governor.

The present Governor-General of Canada is Sir George Douglas S. Campbell, Marquis of Lorne, the heir to the duchy of Argyll, and a son-in-law of the Queen. He entered upon his office December 7, 1878. The Prime Minister is Sir John Alexander Macdonald, who holds the portfolio of the Interior Department. He was the first Prime Minister of the Dominion, holding office from 1867 to 1873, when he made way for Mackenzie, the head of the Liberal party. He returned to power in 1878,

when the Conservatives won the elections on the platform of a protective or "national" policy. The other members of the Privy Council are Sir Charles Tupper, Minister of Railways and Canals; Sir Samuel Leonard Tilley, Minister of Finance; Louis A. W. McLellan, President of the Council; Sir Alexander Campbell, Minister of Justice; A. P. Caron, Minister of Defense and Militia; James Colledge Pope, Minister of Fisheries and Marine; John Henry Pope, Minister of Agriculture; Hector Louis Langevin, Minister of Public Works; James Cox Aikins, Secretary of State; Mackenzie Bowell, Minister of Customs; Joseph Philipppo R. A. Caron, Minister of Inland Revenue; John O'Connor, Postmaster-General.

CENSUS.—From the Dominion census of 1881 the following figures are taken:

PROVINCES.	Area.	Population.	Males.	Females.
	Sq. miles.			
Prince Edward Island.....	2,138	108,591	54,729	54,162
Nova Scotia.....	20,907	440,572	220,583	220,084
New Brunswick.....	27,174	821,283	404,119	417,114
Quebec.....	158,688	1,850,027	978,175	871,852
Ontario.....	101,736	1,923,225	976,470	946,755
Manitoba.....	123,805	65,954	32,207	28,747
British Columbia.....	841,305	49,450	25,503	19,956
Territories.....	2,665,252	56,446	28,118	28,338
Dominion.....	3,470,398	3,324,810	1,688,854	1,635,956

The population of Manitoba within its old limits was 49,502; of the extension, 16,452. [Vancouver Island comprises 16,000 square miles of the territory of British Columbia, and 17,292 of its inhabitants (5,647 Indians). The Island of Cape Breton comprises 4,375 square miles of the territory of Nova Scotia, and 84,500 of its inhabitants.]

The strength of the principal religious sects is shown in the following table:

PROVINCES.	Baptists.	Roman Catholics.	Church of England.	Methodists.	Presbyterians.
Prince Edward Island.....	6,236	47,115	7,192	13,485	33,585
Nova Scotia.....	89,761	117,487	60,255	50,511	112,488
New Brunswick.....	81,092	109,091	46,769	54,519	42,883
Quebec.....	8,863	1,170,718	68,797	39,121	50,287
Ontario.....	106,680	320,839	366,539	551,508	417,749
Manitoba.....	9,499	12,246	14,297	7,470	14,292
British Columbia.....	494	10,043	7,804	3,516	4,095
Territories.....	20	4,443	3,166	461	531
Dominion.....	297,525	1,791,982	574,818	742,981	676,165

Of the Baptists, 50,055 were Free-Will, and 21,234 (in Ontario and Manitoba) Tunkers or Mennonites. Of the Methodists, 582,963 belonged to the Church of Canada, 103,272 were Episcopal, 27,236 Bible Christians, 25,680 Primitive, and 3,830 other Methodists. Of the Presbyterians, 629,280 belonged to the Church in Canada, 32,834 to the Church of Scotland, 12,945 were Reformed, and 1,106 other Presbyterians. There were 7,211 Adventists, 8,831 Brethren, 26,900 Congregationalists, 20,193 Disciples, 2,596 Reformed Episcopalians, 2,393 Jews, 46,350 Lutherans, 4,478 pagans, 6,519 Protestants, 6,553 Quakers, 2,126 Unitarians, 4,517 Universalists, 14,269 of other denominations, 2,634 of no religion; religion not given,

86,769. The increase of the population by immigration has fallen far short of the hopes of the Canadians thus far. The number of immigrants settling in the Dominion in 1881 was 47,991. The construction of 500 additional miles of railroad west of the Red River affords improved facilities to the farmers of the new Northwest. The distance of the prairie-lands of the Dominion from Liverpool is 600 miles less than that of the grain-districts of the United States. The Survey Department laid out into townships, sections, and quarter-sections, 9,000,000 acres in 1881, involving the measurement of 23,000 miles of lines of demarcation. The population by origin and place of birth is given in the following table:

PROVINCES.	ORIGIN.						PLACE OF BIRTH.			
	English.	French.	German.	Indian.	Irish.	Scott.	England.	Ireland.	Scotland.	United States.
Prince Edward Island.....	21,404	10,751	1,076	281	25,415	48,988	1,728	2,915	3,425	609
Nova Scotia.....	128,986	41,219	40,065	2,125	66,067	146,027	4,818	5,600	10,851	8,004
New Brunswick.....	98,387	56,635	6,810	1,401	101,284	49,829	4,174	16,355	4,168	5,108
Quebec.....	81,515	1,078,820	8,948	7,615	128,749	54,928	12,909	27,379	10,287	19,415
Ontario.....	535,835	102,748	188,394	15,325	627,262	878,586	189,081	180,094	82,178	45,454
Manitoba.....	11,508	9,949	8,652	6,767	10,178	16,506	3,457	1,886	2,868	1,752
British Columbia.....	7,297	916	858	25,661	8,172	8,892	8,294	1,285	1,204	2,295
Territories.....	1,874	2,896	21	49,472	281	1,217	98	62	186	116
Dominion .....	881,801	1,298,929	254,319	108,547	957,408	699,863	169,504	185,526	115,062	77,753

There were 21,394 persons of African origin, of whom 7,062 were in Nova Scotia, 1,688 in New Brunswick, and 12,097 in Ontario; 4,383 of Chinese origin, all but 33 in British Columbia; 30,412 of Dutch, 1,009 of Icelandic (773 in Manitoba), 1,849 of Italian, 667 of Jewish, 1,227 of Russian and Polish, 4,214 of Scandinavian, 1,172 of Spanish and Portuguese, 4,588 of Swiss, and 9,947 of Welsh origin; 2,780 of various origins; origin not given, 40,806. Of the inhabitants, 3,715,492 were born in the Dominion (101,047 in Prince Edward Island, 420,088 in Nova Scotia, 288,265 in New Brunswick, 1,327,809 in Quebec, 1,467,988 in Ontario, 19,590 in Manitoba, 32,275 in British Columbia, and 58,430 in the Territories), 4,596 in Newfoundland, 814 in the Channel Islands, 2,783 in other British possessions, 4,389 in France, 25,328 in Germany (23,270 being in Ontario), 777 in Italy, 8,376 in Russia and Poland (5,651 being in Manitoba), 215 in Spain and Portugal, 2,076 in Sweden, Norway, and Denmark, 7,455 in other countries, 380 at sea; place of birth not given, 6,334.

The cities and towns of over 5,000 inhabitants are shown below:

NAMES.	POPULATION.	
	1871.	1881.
Montreal, Quebec.....	107,225	140,747
Toronto, Ontario.....	56,092	86,415
Quebec, Quebec.....	59,699	62,446
Halifax, Nova Scotia.....	29,582	36,100
Hamilton, Ontario.....	26,716	35,961
Ottawa, Ontario.....	21,545	27,412
St. John, New Brunswick	28,805	26,127
London, Ontario.....	15,826	19,746
Portland, New Brunswick	12,820	15,226

**CRIME.**—The criminal statistics of Canada, officially reported for 1880, show that 40,874 persons were charged with, and 28,209 convicted of, criminal offenses. There were 6,622 charged with offenses against the person, and 4,507 convicted; 350 charged with offenses against property with violence, and 176 convicted; 4,563 charged with offenses against property without violence, and 2,380 convicted; 1,055 charged with malicious offenses against property, and 638 convicted; 125 charged with forgery, etc., and 41 convicted. Of specific offenses, 32 were accused, and 5 convicted, of murder; 18 accused, and 8 convicted, of manslaughter; 47 convicted of assault with murderous intent; 9 of rape, 18

of endangering the safety of railroad-passengers, 4 of concealing births, 5 of abortion, 4 of bigamy, 3,957 of assault and battery, 53 of burglary, 2,248 of larceny, 41 of counterfeiting, 8,438 of drunkenness. There were 5 executed, 2 sentenced to imprisonment for life, and 90 for five years and over. The occupations of the convicts were reported as follows: Agricultural, 998; commercial, 3,307; domestic, 1,563; industrial, 4,100; professional, 228; laborers, 7,218. There were 16,856 residents of towns against 3,059 from the rural districts; 7,683 married, 1,242 widowed, and 11,269 single; 10,286 reported as Roman Catholics, 2,496 as Church of England, 1,508 Presbyterians, 1,406 Methodists, and 507 Baptists.

**COMMERCE.**—The total volume of the foreign trade of Canada, in spite of the restrictive tariff, was larger in 1881-'82 than in any previous year. The exports amounted in round numbers to \$101,000,000, and the imports to \$119,500,000. The value of exports and of imports, with the duties collected upon them each year since confederation, is given below to indicate the fluctuations of Canadian commerce and the economical and fiscal effects of the new tariff which went into operation in 1879:

YEAR.	Exports.	Imports.	Duty.
1868.....	\$57,567,888	\$78,457,644	\$3,819,481
1869.....	60,474,781	70,415,165	8,298,909
1870.....	78,578,490	74,814,889	9,462,940
1871.....	74,178,618	96,092,971	11,848,655
1872.....	82,689,668	111,480,527	18,045,498
1873.....	89,789,922	128,011,281	18,017,780
1874.....	89,851,922	128,218,281	14,421,882
1875.....	77,886,979	128,070,288	15,861,382
1876.....	80,966,435	98,210,846	12,888,114
1877.....	76,875,898	98,827,962	12,548,451
1878.....	79,823,667	98,081,787	12,795,698
1879.....	71,491,255	81,964,427	12,939,540
1880.....	87,911,458	86,489,747	14,198,849
1881.....	98,290,828	105,890,840	15,500,755
1882.....	*101,000,000	119,500,000	22,000,000

Although the national policy has not succeeded in altering the adverse balance of trade which was deplored by its promoters, it has accomplished the object aimed at of reversing the relative positions of Great Britain and the United States in Canadian commerce. The United States, however, still enjoy a large trade with the Dominion, aggregating in 1881 \$73,000,000 according to the Canadian returns, and \$89,000,000 according to the American figures, which include Newfoundland. The

\* About.

imports from Great Britain amounted in the fiscal year 1882 to about \$43,500,000. The shipments of cattle and sheep showed a falling off. The numbers were 45,435 cattle and 62,401 sheep, exclusive of 7,955 of the former and 9,465 of the latter shipped from American ports.

A direct line of steamers was started in 1881, which make monthly trips to Brazil, the West Indies, and Spanish South American ports by the aid of a Government subsidy. This enterprise is connected with the "national policy" of the Government, which aims to supply the needs of the Dominion for tropical products by means of direct trade with the producing countries as well as to exclude American manufactures in favor of British, and British manufactures as far as protective duties will stimulate the development of Canadian industries. Attempts are being made to establish commercial relations with Australia, where there is already some trade, and with Cape Colony, India, China, etc.

Among the principal commercial events of the year was the fusion of the two great railroad corporations of the eastern provinces—the Grand Trunk and the Great Western. The products of the fisheries in 1881 amounted to \$15,817,162. The value of the canned salmon from British Columbia was alone over \$1,000,000. The copper and the iron ore, which is sent in large quantities to the United States, the phosphates, the asbestos, and the graphites of Canada are exported in increasing quantities. The lumbering industry labored under a depression in 1882 from a lessened demand. The protective duty of 50 cents a ton on anthracite and 60 cents on bituminous coal, which was imposed in 1879, has stimulated the coal-mining industry of Nova Scotia to some extent; but the failure of wood-fuel, which has risen in price as much as 50 per cent in two years in some localities, has much to do with the increased production, since the imports have increased at the same time. The output of the Nova Scotia mines since the imposition of the duty was as follows: 688,629 tons in 1879; 954,659 in 1880; 1,034,014 in 1881. In the first nine months of 1882 an increase of 18.3 per cent was shown over the corresponding period in 1881. The increasing exports from British Columbia, the greater part of which are shipped to the Pacific States, but small quantities also to the Sandwich Islands and Mexico, lower the adverse balance. The total exports from the Dominion in 1877-'78 were 340,127 tons; the imports, 406,090 tons of anthracite and 456,971 tons of bituminous, together 863,961 tons. The total exports of 1880-'81 were 420,955 tons; the imports, 572,092 tons of anthracite and 587,023 of bituminous, together 1,159,115 tons. In 1878 Nova Scotia exported more than British Columbia, but in 1880-'81 the exports from the Pacific colony were 214,243 tons, of which 207,806 went to the United States, against 190,551 tons from Nova Scotia.

**FINANCES.**—The public debt of the Dominion was incurred chiefly on account of public works—canals, railways, etc. About \$25,000,000 have been added to the debt since 1878. The debt stood in 1881 at \$199,861,537; of which total \$98,729,249 bore interest at 4 per cent, \$52,110,026 at 5 per cent, and \$17,839,064 at 6 per cent. The average interest on the debt payable in London was 4.40 per cent, against 5.55 per cent in 1867, when the total liabilities amounted to \$93,046,051. The interest charge constitutes nearly one-quarter of the whole expenses of the Dominion Government, amounting in 1879 to some 7 millions. The assets of the Government were counted at \$44,465,757, an increase of \$10,000,000 since 1878.

The receipts on account of the consolidated fund, or regular revenues, were larger in 1880-'81 than in any previous year, being \$29,635,297, the next largest having been \$24,648,715 in 1875. There was an increase of \$6,000,000 over the revenue of 1879-'80, the first manifestation of the working of the new tariff since the revival of business. The revenue for 1881-'82 gave still stronger evidence of the prosperity of the country and the demand for imported goods notwithstanding the high duties. The revenue for 1880-'81 yielded a surplus of \$4,132,743 over all expenditures; in 1881-'82 there was a further increase of \$3,000,000, the income exceeding \$32,000,000.

The expenditures on account of the consolidated fund, or ordinary expenditures of the Dominion Government in 1880-'81, amounted to \$25,502,554. Among the principal items were: Civil government, \$915,958; administration of justice, \$583,957; militia and defense, \$667,000; Public Works Department, \$1,138,765; Indian grants, \$805,097; immigration and quarantine, \$250,812; census, \$127,033; geological survey and observations, \$111,352; expenses of collecting customs, \$717,704; of excise, \$247,577; of public works, \$2,703,665; of the post-office, \$1,876,657.

The expenditures on account of the consolidated fund for the year ending June 30, 1882, amounted to \$26,419,670.

The expenditure on capital account, during 1880-'81, amounted to \$8,176,316, of which \$4,968,503 represents outlay on the Pacific Railway, \$608,732 on the Intercolonial Railway, \$1,242,943 on the Welland Canal, \$411,608 on the Ottawa canals, \$334,681 on Dominion lands, and the rest on the other canals, etc. The Government railways, embracing the Intercolonial and Prince Edward Island lines, have not yet been made to yield an income above the working expenses. Since 1868, when the Dominion Government assumed the administration of the Northwest Territories, there was expended upon them, down to 1880-'81, altogether, \$30,406,481. Of this, \$20,778,781, including \$17,524,100 expended upon the Canada Pacific Railway, were charged to capi-

tal account. The aggregate amount of revenue received from them from the beginning was \$593,293, not one fourth as much as the expenses of the mounted police alone.

The total revenue from all sources for the year 1881-'82 was reported as \$32,188,793, and the total expenditures on account of the consolidated fund, \$23,753,193.

The excess of the revenue from customs over the expected yield of the new tariff has caused the Government to modify various duties, by which a reduction in the receipts estimated to amount to \$1,500,000 will be attained. The reductions are in articles of food and in various manufacturing materials. The ill-advised corn duties, directed against the United States imports, have been altered, and the duties on tea, coffee, etc., lowered.

The estimated expenditures on account of the consolidated fund for the year ending June 30, 1883, amount, with the supplementary estimates, to \$28,102,628. The estimated expenditures on capital account are \$25,994,767. The acceleration of the Pacific Railway works increases the subsidies and other expenditures in connection with it to \$14,754,000 for the year. Of the remaining estimated expenditures \$2,829,000 are in the improvement of the canal system, and \$609,086 on the burdensome Intercolonial Railway.

LEGISLATION.—The session of the Dominion Parliament opened February 9th, and came to a close May 17th. No important measures were passed. The one which provoked the most discussion was the redistribution of seats in accordance with the new census. A civil-service act provides for the examination of candidates before entering the civil service, but does not make the examinations competitive. A few amending bills relating to jurisprudence were passed, including one providing for the extradition of fugitive offenders within the limits of the British Empire. A commission appointed to investigate the abuses of factory-labor had reported in favor of legislation similar to the English and American factory acts. A bill with very moderate provisions was framed by the Government, but afterward dropped. The establishment of a railroad commission was proposed by a private member, but not entertained. An act was passed making the practice of ticket-scalping a punishable offense. As many as twenty-three charters for railroad or bridge companies were granted or amended, and several subsidies voted.

A strong sympathy has been felt by the majority of the people of Canada for the Irish in their conflict with the British Government. The Canadian politicians were carried so far by this feeling, and by a desire to propitiate the large Irish vote, as to send an address to the Queen, recommending home rule as the solution of the Irish difficulty. The resolutions were introduced in the House of Commons by a private member, Costigan, who afterward re-

ceived a ministerial portfolio. Both the party leaders, Macdonald and Blake, expressed warm sympathy with the Irish, and the motion was carried in both Houses without a dissenting vote. The address set forth the facts that the Irish in Canada are prosperous and contented; it attributed the preference of Irish emigrants for the United States to their estrangement toward the British Government; it expressed the hope that the federal system with considerable powers of self-government, under which Canada has prospered, might be adopted between England and Ireland; finally, it petitioned for the release of the suspects. The indifference shown by the Canadians to the interests of British manufacturers, and to the representations of the British Government, when they adopted a protective tariff, had given deep offense to the English. The reply of Lord Kimberly, the Colonial Secretary, to the Irish resolutions of the Canadian Parliament was as sharp as it could be written, declaring that "her Majesty will, in accordance with the Constitution of the country, have regard to the advice of the Imperial Parliament and ministers, to whom all matters relating to the United Kingdom exclusively appertain."

ELECTION.—The Conservative Government, feeling secure in the popularity of the "national policy" at present, determined to procure a new lease of power before the expiration of the Parliament by lapse of time in 1883. After prorogation Parliament was dissolved and new elections ordered in June. The Liberal or Reform party were taken at a disadvantage by making the issue on the protective question. They had been free-traders hitherto, but were beginning to turn with the tide. The leader, Edward Blake, seeing the hopelessness of the free-trade views still advocated in the "Globe" newspaper, the organ of the party, preferred to enter the conflict without a party cry. He made use of the temporizing phrases familiar in American politics, of "incidental protection" and the "impossibility of free trade" in a country which must collect a revenue from customs, in order to retrieve his position. The boundary dispute was only available in Ontario, and could only harm the party elsewhere. The Pacific Railway arrangement was as permanently settled as the protective tariff, and added to rather than detracted from the strength of the Government party. The result was a Conservative victory. The new apportionment had increased the number of seats belonging to Ontario by 4, and of Manitoba by 1, leaving the other provinces with the same number as before. Seven of the leading Liberals lost their seats. The Conservative majority was not as large as in the last Parliament, in which they held 145 out of 206 seats. They were practically as strong, however, forming a compact party under the control of their skillful leader with a clear majority of 60 in the new House of 211 seats.

WELLAND CANAL.—The deepened Welland

Canal, with two feet more of water, or twelve feet throughout its length, was opened April 20th. The vessels which bring grain from the ports of the upper lakes and discharge it in the ports of Lake Ontario usually have a carrying capacity of 240 tons, but could not carry more than three quarters of a cargo when the draught of the canal was ten feet. The effect of the improvement on the commerce of the lakes was noticeable at once. The action of the State of New York in abolishing the tolls on the Erie Canal excited an agitation in Canada in favor of making the Dominion canals free, in order to compete with the American water-route.

**ONTARIO BOUNDARY.**—The boundary dispute between Ontario, Manitoba, and the Dominion Government continued the subject of excited controversy during the year. The disputed territory is about 97,000 square miles in extent. It is rich in timber, and contains mineral resources and some fertile tracts of land. The arbitrators to whom the question was referred in 1878, by the Dominion and Ontario Governments, awarded it to Ontario as possessing, under the British North America act, the same boundaries as the former province of Upper Canada, which had succeeded to the western boundaries of old Quebec. The western line was defined by the Treaty of 1763 with France as the extension of a line drawn along the course of the Mississippi River. The northern line was determined by the southern boundary of the Hudson Bay Company's Territory, which was defined to be the "height of land." The Ontario Legislature promptly ratified the decision. The Dominion Parliament not only omitted to do so, but made Manitoba a party to the dispute by an act passed in the closing days of the session of 1881, making the boundary of Manitoba coterminous with the western border-line of Ontario. The Dominion Parliament passed a resolution in April providing for the joint administration of the disputed territory by a commission appointed by the provincial Government of Ontario and the Federal Government, pending the adjudication of the matter by the Supreme Court or the Privy Council. At the close of the year, the question was still unsettled, the Ontario Government being unwilling to have the award of the commission of arbitration—Sir Edward Thornton, Sir Francis Hincks, and the late Chief-Justice Harrison—reviewed by another tribunal. This controversy between the Tory Government of the Dominion and the Liberal Government of Ontario was the leading political question of the year. By the act of 1881, about 35,000 square miles of the disputed territory would be joined to Manitoba, including all the valuable timber between Lake Superior and the Lake of the Woods, estimated at 26,000,000,000 feet.

**ONTARIO.**—The receipts of the Ontario Government for the year 1881 were \$2,746,772; of which \$1,116,872 was the subsidy from the

Dominion Government, \$80,000 specific grant, \$136,696 interest from special funds, \$992,504 revenue from the crown lands, \$98,782 revenue from public institutions, and the remainder from other internal sources. The expenditures under the supply bill footed up \$2,281,063, which, together with \$205,528 in aid of railways, and other permanent outlays, made a total expenditure of \$2,585,053. The chief items of current expenditure were: Education, \$502,824; maintenance of public institutions, \$551,668; administration of justice, \$251,119; legislation, \$178,954; civil government, \$174,803. The liabilities of the province amounted to only \$731,396; the public assets were valued at \$6,240,988. The budget estimates for 1882 made the receipts \$2,848,960; and the expenditures for current expenses \$2,100,169, on capital account \$247,220, together \$2,389,726. This province stands in the peculiar financial position of drawing sufficient revenues from the common property, with the fixed subsidy from the Dominion, to defray all the usual expenses of government and relieve the municipalities of the cost of maintaining asylums and prisons and of a large share of the cost of public education, without levying a single tax upon the people. The income is even sufficient to leave a large annual surplus to be added to the assets of the province. About \$500,000 was added in 1882 to the surplus, which amounted on December 31, 1881, to over \$2,000,000 in cash or its equivalent, and \$2,500,000 in other assets. The expenditures of 1882 showed a large increase over the preceding year, but the increase was entirely applied to the maintenance of public institutions, for which \$380,000 more than the appropriations of 1881 were voted, and in public education, which item increased \$51,000.

The right of the provinces to property escheating to the crown for want of heirs was formerly maintained by the courts of Ontario and Quebec. In a recent case the Dominion Government claimed the right to the reversion, and was upheld in its claim by the Supreme Court of Canada. The question was taken before the Privy Council by the Ontario Executive.

A Bureau of Industries for the collection of statistics, corresponding to the Agricultural Bureau at Washington, was established in the province of Ontario by an act of the Legislature.

The agricultural interests of Ontario are flourishing, notwithstanding the desertion of many of the old farms for the new wheat-fields of Manitoba and Dakota. Owing to this movement, the value of farm property has recently declined. The production of wheat in 1882, as reported by the new Bureau of Statistics, was 40,000,000 bushels, against 13,000,000 in 1870; of barley 22,250,000 bushels, against 9,461,000; of oats, 50,000,000 bushels, against 22,000,000. The acreage of land under cultivation was shown by the census to have increased 1,878,000 acres in ten years.

**THE NORTHWEST.**—The number of immigrants who settled in the Dominion in 1881 was 47,991, of whom about 28,600 went to Manitoba and the Northwest Territory. In the first nine months of 1882, 46,739 immigrants arrived, against 30,434 in the same period of 1881. There were 2,753 homesteads, comprising 438,707 acres, located in Manitoba and the Northwest Territories during 1881, a less number than in 1879. The number of acres pre-empted was 263,647. The settlements have been planted in all parts of the Northwest as far as the foot of the Rocky Mountains. The total number of homesteads located down to the end of 1881 was 14,124; the total number of acres occupied, 2,358,163.

Several colonization societies, some of them probably with speculative objects, have secured tracts in the Northwest under the provisions of a recent act releasing such bodies from the restrictions against purchases by non-residents. Within a year of the issue of the new regulations on May 25, 1881, some 7,000,000 acres were conveyed to various colonization companies, the price being the regular \$2 an acre, one fifth in cash and the rest in four annual installments, or, by a later arrangement, half the pre-emption price paid down in full.

One of the tracts was taken by a temperance colonization society, which will not allow the manufacture or use of intoxicating liquors within the limits of the settlement. As a counter-stroke, the licensed victualers started an association and purchased a neighboring tract. A company was formed, under the presidency of the Duke of Manchester, which acquired the title to a large portion of the Pacific Railway grant west of Brandon, with the object of promoting the colonization of distressed agriculturists from Ireland and Great Britain.

The efforts expended in instructing and encouraging the Indians of the Northwest in the raising of cattle and cultivation of the soil are gradually meeting with success. The Government felt impelled three or four years ago to supply the Indians with food in order to save them from impending famine, the consequence of the disappearance of the buffalo, which no longer crossed the border, and of the gradual extinction of small game. The supplies were continued the following year, and have now become a regular item of expenditure. Collisions are anticipated between whites and the red-men as the settlement of the Northwest progresses. To avert them it is proposed to raise the mounted police to double the existing force.

The Northwest Territory was divided by an order in Council into four separate districts or territories, named and bounded as follows: Assiniboia, containing about 95,000 square miles, bounded on the south by the frontier line of the United States, on the east by the western boundary of Manitoba, on the north by a line drawn near the 52d degree of latitude,

and on the west by one drawn between the 110th and 111th meridians; Saskatchewan, containing 114,000 square miles, bounded on the south by Assiniboia, on the east by Lake Winnipeg and Nelson River, on the north by a line near the 55th parallel, and on the west by a continuation of the western boundary-line of Assiniboia; Alberta, containing 100,000 square miles, bounded on the south by the American frontier, on the east by Assiniboia and Saskatchewan, on the west by British Columbia, and on the north by a continuation of the northern boundary-line of Saskatchewan; Athabasca, containing 122,000 square miles, bounded on the south by Alberta, on the west by British Columbia, on the east by the continuation of the eastern boundary of Saskatchewan deflected westward until it strikes the Athabasca River, and then by this river and the lake of the same name and the Great Slave Lake to the northern boundary, which is near the 60th degree of latitude. In Assiniboia are Q'Appelle, South Saskatchewan, and Souris Rivers, and Forts Pelly and Ellice. Saskatchewan includes Battleford, Carleton, and Prince Albert. Alberta is the cattle-ranch district, containing the Belly, Battle, and Bow Rivers. The famous Peace River district is in Athabasca.

**PACIFIC RAILWAY.**—The Canada Pacific Railway is being built at a more rapid rate than the specifications call for, and will probably be completed from ocean to ocean by the year 1886, or 1887 at the latest. The history of this enterprise has been recounted in former volumes of the "Annual Cyclopædia." It was in brief as follows: Upon the entrance of British Columbia into the Confederation, in 1871, a promise was given that the Canadian Pacific Railway should be built by the Dominion, and completed within ten years. A company undertook the work for a cash subsidy of \$30,000,000 and a land grant of 50,000,000 acres. The people were suspicious of the relations of the company to the ministers and party in power, and to managers of American railroads. At the general election Sir John A. Macdonald was voted out of office, and the first Canada Pacific Railway Company collapsed. The succeeding Prime Minister sought to obtain a new arrangement with British Columbia. The negotiations were prolonged two years, but finally came to nothing. In 1874 Mackenzie, who had professed the intention to redeem the pledge to British Columbia as nearly as possible, passed an act authorizing the construction of a transcontinental railway, either as a government work or by a private company. All efforts to induce capitalists to undertake the scheme were unavailing. The Government had expended a large amount of public money in the construction of portions of the line, when they were defeated at the polls in 1878. Sir John A. Macdonald, upon his return to office, after failing to induce English capitalists to embark in the enterprise, formed a syndicate,

composed of Americans, Canadians, and some English and Continental capitalists, to take the burden off the shoulders of the Government. The Government was thus relieved from the apprehension of an annual deficit of from \$1,000,000 to \$2,000,000 in operating the road

have established a coast telegraph, working a system of signals to convey the intelligence of the appearance of shoals of fish to the fishermen all along the coast. A similar plan has been operated with success in Norway. Large shoals of fish visit the shores of Newfound-

ROUTE OF THE CANADIAN PACIFIC RAILROAD.

after it was completed. The company agreed to finish the road by 1891, and keep it in operation forever. In return they received a cash subsidy of \$25,000,000, a land subsidy of 25,000,000 acres, and the 710 miles of railroad already constructed or contracted for by the Government, together with exemption from taxation and the monopoly of the traffic of Manitoba and the Northwest for twenty years. The Pacific Railway Company, which was formed in 1881, by the acquisition of the Canada Central Railroad, can reach Ottawa and Brockville, on the St. Lawrence, from their eastern terminus at Callender. They have a branch line between Pembina and Winnipeg, and are making connection with the Sault Ste. Marie. With its branches, the road will have a total length of some 4,000 miles. The section between Rat Portage and Winnipeg, 135 miles, was completed in 1881, and transferred by the Government to the company; the portion between Kamloops and Port Moody is also being built by the Government, and the eastern section, from Callender westward, as part of the bargain. The company are prosecuting the road through the fertile belt and its connections. It is expected that the year 1888 will see it completed to the foot of the Rocky Mountains. The route to be taken in crossing the mountains is not definitively settled. The Yellowhead Pass, to be approached from Edmonton, on the North Saskatchewan, was in favor until the Governor-General's visit to the Northwest; but an easier pass, situated above the sources of the Bow River, a tributary of the South Saskatchewan, from which the railroad would descend into the valley of the Columbia River on the western side, is now the expected route.

NEWFOUNDLAND. — The Newfoundlanders

land, but it is never known where or when they will appear. The fishermen can now sail at once to the spot, and utilize the opportunities which only came to them before by chance. The telegraph can also spread information about the movements of the ice, which is important not only to fishermen, but to the seal-fishers and the shipping industry. The fishermen of Newfoundland have lately fallen into a lamentable condition of bondage to the capitalists who have advanced them money. The men who speculate in their labor form the class which controls the legislation of the colony. They take the fish from the fishermen, and pay them in many districts entirely in kind.

DRAPER, HENRY, M. D., LL. D., son of Dr. John W. Draper, born in Prince Edward County, Virginia, March 7, 1837; died in New York, November 20, 1882. His death was sudden and unlooked for, being caused by an attack of pneumonia. He was in the prime of life, and his reputation was nearly, if not quite, equal to that of his father, whom he succeeded as professor in the New York City University. Henry Draper inherited an ardent liking for chemical studies and researches, and he stood, with his father, in the front ranks of that science. His early education was obtained in the public schools of New York city, from which he passed into the university, where he took the medical course, and graduated in 1858, at the age of twenty-one. The next year he traveled in Europe, directing his attention everywhere to scientific matters. An inspection of Lord Rosse's world-renowned telescope gave an impulse to his thought and effort in celestial photography, a branch of science which he afterward pursued with eminent success. On his return home he served, for

about a year and a half, on the medical staff of Bellevue Hospital. He was then elected to the chair of Physiology in the University of the City of New York, and six years later (1866) was placed in the chair of Physiology in the medical department of the same institution. As managing officer in that department he was active and energetic, and was also very successful in arousing interest in the institution after the severe loss of property it met with by fire. At this time he married a daughter of Courtland Palmer, of New York, who not only brought to him wealth and abundant means to carry forward to any extent his scientific pursuits, but also entered warmly into her husband's studies and purposes. His attention had been directed, when he was quite a youth, to the possibilities of microscopical photography, of which he made valuable use in medical science; he also incidentally discovered the use of protochloride of palladium in darkening collodion negatives. Soon after returning from Europe he constructed a fifteen-and-a-half-inch reflecting telescope, and, with the aid of this instrument, took a photograph of the moon, fifty inches in diameter. Professor Draper was the first to obtain a photograph of the fixed lines in the spectra of stars, an experiment which has been repeated only once or twice since. He was incessantly devoted to his work, and is said to have obtained photographs of more than one hundred of the spectra of different stars. In 1874 he was appointed, by Congress, to the commission created to observe the transit of Venus across the disk of the sun. As superintendent of the photographic department of the commission he was so successful in his work that a special gold medal was struck in his honor, by order of Congress, in the mint at Philadelphia. In 1877 he published a paper entitled "Discovery of Oxygen in the Sun, and a New Theory of the Solar Spectrum." The theory has been doubted and disputed, but it is reported that further studies in science tend to vindicate Draper's conclusions. At this date he visited the high ground between the Rocky Mountains and the Sierra Nevada, to test the question whether a great elevation was of special advantage for locating an observatory. As between lofty elevations inland or near the sea, he gave his judgment in favor of the latter as the most favorable site for an observatory. In 1878 he went to the Rocky Mountains again to photograph an eclipse of the sun, and for two years subsequent he labored to obtain photographs of the nebula of Orion. His observatory at Hastings-on-the-Hudson, and his laboratory at his residence in New York, were admirably equipped with everything which a scientist could desire, and he was one among the very few who could carry on any course of study or experiment without regard to cost or expenditure. Professor Draper died childless, and left no immediate descendant to carry forward his favorite studies.

DRAPER, JOHN WILLIAM, M. D., LL. D., born at St. Helen's, near Liverpool, England, May 5, 1811; died at Hastings-on-the-Hudson, January 4, 1882. His early education was at the Wesleyan School, Woodhouse Grove, where his scientific tastes were early developed. He pursued the study of physics, chemistry, and higher mathematics, under private instructors, and in 1829 went to the University of London, where he devoted himself to investigations into chemistry, specially, and the science of medicine in general. Most of his family having emigrated to the United States, John William followed, in 1833 entered the University of Pennsylvania, and graduated in medicine in 1836. His thesis on the crystallization of camphor under the influence of light, and kindred subjects, was regarded as of such superior merit that it was selected by the faculty for publication. This was the first of a long series of experimental researches on radiant energy. It led to his appointment to the chair of Chemistry and Physiology in Hampden Sidney College, Virginia, where he prosecuted these and other investigations in the same line. In 1839 he was invited to assume charge of his favorite department in the University of the City of New York, a position which he held during the remainder of his life. In 1841 he was active in establishing the University Medical College, of which he was presiding officer for nearly forty years. Dr. Draper's later years were spent at Hastings-on-the-Hudson, near the astronomical observatory of his son, Dr. Henry Draper. His wife died many years before him, leaving three sons and three daughters. His sons followed in their father's footsteps, and have maintained the family reputation.

Dr. Draper was a man of more than ordinary note in science; he was also a student and earnest thinker in the department of the philosophy of history and human progress. For more than forty years he was occupied in making experimental researches in physiology and molecular chemistry, and gave to the world the results of his work in the pages of "The New York Medical Journal," "The Journal of the Franklin Institute," "The American Journal of Science," and "The London Philosophical Magazine." These researches cover a very large range of subjects, but were chiefly devoted to a study of the chemical phenomena of light, in both the organic and inorganic world. In 1878 Dr. Draper collected and condensed these researches, and published them in a volume, entitled "Scientific Memoirs, being Experimental Contributions to a Knowledge of Radiant Energy" (8vo, pp. 473). This volume is pronounced by competent judges to be a noble monument to his memory, being the results of labors which have greatly advanced the sum of human knowledge. In it he claims to have been the first in America to give attention to the spectroscope and its importance in astronomical science. "The first photographic portrait from the life was made by me" (he says).

"I also obtained the first photograph of the moon. When Daguerre's process was published I gave it a critical examination, and described the analogies existing between the phenomena of the chemical radiations and those of heat." These and numerous other services which he rendered to science were freely acknowledged; and the American Academy of Arts and Sciences, at Boston, bestowed upon him the Rumford medals for the year 1875 (one of gold and one of silver) for his "Researches on Radiant Energy." A full list of Dr. Draper's other scientific memoirs and papers, corrected by himself, is given in an address delivered by him in 1874, entitled "Contributions to Chemistry" (pp. 78-82). A number of papers in science are in the hands of his sons, who, it is expected, will publish them in due time.

In addition to his profound researches in science, Dr. Draper gave attention to other, and, as he regarded them, kindred topics. His "History of the Intellectual Development of Europe" appeared in 1862, and has been translated into French, German, Italian, Polish, Russian, etc. Four lectures delivered by him, in 1865, before the New York Historical Society, were published under the title of "Thoughts on the Future Civil Policy of America." Between 1867 and 1870 he gave to the public his "History of the American Civil War" (three vols., 8vo); and in 1874, a volume entitled "History of the Conflict between Religion and Science" (12mo). Dr. Draper was also a frequent contributor to the pages of scientific journals and magazines.

**DWELLINGS, LABORERS'.** The question of sanitary dwellings for the poor has not awakened the interest of legislators in the United States beyond the requirements of proper plumbing, fire-escapes, etc. Even these laws are suffered to fall into disuse. Philanthropic individuals have built model tenement-houses in Brooklyn, New York, and other places. Yet, although the results were fairly satisfactory, the movement in this direction has ceased. The great Peabody buildings of London have yet no counterpart in American cities. These were erected in a district where the mortality was the greatest in the metropolis, double the usual rate. In them the death-rate is considerably below the average. For fifteen years the British Parliament has made the housing of the working-people of London a subject for legislative interference. In the same time private persons have devoted large amounts of capital to providing sanitary dwellings for the poor at low rents. The effect of the laborers' dwellings' acts of Parliament has apparently been to crowd the poorer population more closely together, and to increase their rents some 17 per cent on an average. Such were the untoward results temporarily of the first laws, under which a large number of buildings were condemned, but which contained no provisions for the shelter of the tenants who crowded into the remaining tenements. The rise in

rents is really due to the increased value of property for business and residences. This increase may be judged from the rise in the assessed valuation of the city of London, which has been 185 per cent in twenty years. The rents of rooms in the Limehouse and Whitechapel districts of the metropolis have risen in consequence of the development of business and population from two shillings to more than double, and whole families are sometimes crowded into little closets which are now let for two shillings or less a week. The landlords of these miserable tenements are usually small speculators, who have no sense of responsibility for the condition of the houses. The death-rate, which was under 20 per 1,000 in the rest of the metropolis, rose in these wretched courts to 40 per 1,000. The spread of zymotic diseases from these centers affected the whole population. To meet these evils the acts of 1875 and 1879 were introduced by the Conservative Government, the failure of which was the subject of a parliamentary investigation in 1881 and 1882. The Torrens acts of 1868 and 1869 enabled the vestries to close the worst houses in certain districts. Sir Richard Cross's acts gave power to the Metropolitan Board to buy up whole areas in unsanitary districts, with due compensation to owners, and imposed the duty upon it of providing accommodations for a number equal, at least, to the number of tenants disturbed. The local medical authorities indicated immediately over a score of areas which needed purification; but the vestries did not come forward with the proper co-operation. The Metropolitan Board proceeded to do the work in some of the condemned areas; but the majority of cases were referred back to the vestries, which not only let them drop, but from that time ceased to enforce the Torrens acts. The local boards were deterred, from a regard for the local popularity of their members. The consequences have been, that the offenders have escaped entirely the burden of the improvements, which have been shifted to the shoulders of the rate-payers, and that the improvements made under these conditions are of insignificant extent. The result of seven years' working of the Cross act has been that improved dwellings have been provided for only some 3,000 persons a year, about 3½ per cent of the annual increment of the population. There have been fourteen areas, covering forty-two acres, rebuilt under the act of 1875, domiciling about 20,000 people. The cost has been £1,500,000, of which 24 per cent only has been reimbursed by the sales of the cleared sites, leaving a net loss to the treasury of £1,200,000. For the whole of the expropriated land, except two or three acres sold for commercial purposes, only about one quarter of the cost was paid by buyers for the purpose of erecting houses for artisans under the conditions of the act. The small portion which they were enabled to dispose of for business sites, under the compulsory

clause requiring them to provide accommodations for at least as many of the working-classes as were displaced, brought five times the price per foot. The failure of the artisans' dwellings acts can be accounted for by the fact that in the greater part of London houses for the poor do not pay except by overcrowding, to-

gether with the liberal notions of compensation which prevail in England. The Corporation of London cleared two spaces at a cost of £240,000. They are offered for the ground only £1,250 a year for dwellings, but six times as much if shops may be built, and look to Parliament to save them from loss.

## E

## EARTH, AREA AND POPULATION OF THE.

During the last decade of years great attention has been given to attaining accurate estimates of the areas and populations of all the countries of the world, and their subdivisions. Drs. Behm and Wagner, in a new edition of their well-known collection of statistics, entitled "The Population of the Earth" ("Die Bevölkerung der Erde"), have availed themselves largely of planometric calculations for areas of many countries, and have used the new censuses which have been taken, within two years, in Greece, Denmark, United States, Finland, Germany, Switzerland, Belgium, Austria, Hungary, Bulgaria, Great Britain and dependencies, France, and Italy. The names of the countries are given in the order of the dates of the census. For most of these countries the complete results have been issued, and for the others the editors have been able to obtain the preliminary figures. Of course, estimates are sometimes little better than guesses; e. g., Africa, for which some authorities give 100,000,000 as its population, while Behm and Wagner hold on to the old figure of 200,000,000 with considerable hesitation. China, too, has been very variously estimated from 200,000,000 to 500,000,000. According to Behm and Wagner, in their latest issue, the number of the inhabitants of China does not exceed 379,500,000—a figure more likely to be near the truth, especially considering the large reductions in the population of certain districts in recent years from various causes not necessary to specify. And, further, as to estimated areas, it appears that General Strelbitsky, in a learned work on the "Superficies of Europe," makes out France to be 1,960 square miles larger than the official area, and Scandinavia 6,000; while from Italy he takes away 3,200 square miles. Messrs. Behm and Wagner have, however, examined all the data on these points with the greatest care and minuteness; they are supplied with all the material necessary to arrive at satisfactory conclusions; they have devoted many years to this particular study; and we believe that their results may be accepted with entire confidence. (See EUROPE, AREA OF.)

According to the latest data, the following are the areas and populations of the various continents, with the number of inhabitants per square mile:

CONTINENTS.	Square miles.	Population.	Number per square mile.
Europe.....	8,892,234	327,743,500	84.0
Asia.....	17,832,340	795,591,000	44.0
Africa.....	11,929,300	205,823,300	17.0
America.....	15,889,250	100,415,400	6.5
Australasia and Polynesia..	8,581,140	4,232,000	1.1
Polar regions.....	1,791,280	82,500	...
Total.....	54,415,544	1,483,887,600	26.8

The following are the areas and populations of the various countries of Europe, with the dates to which the figures refer:

COUNTRIES.	Area in square miles.	Population.	Date.
Germany.....	210,198	45,284,061	1880
Austria.....	112,000	22,144,244	1880
Hungary.....	129,051	13,695,184	1880
Holland.....	12,200	4,060,580	1880
Luxemburg.....	1,035	209,570	1880
Belgium.....	11,373	5,596,654	1879
Great Britain and Ireland	124,980	35,246,562	1881
Switzerland.....	16,560	2,846,102	1880
France.....	211,428	37,321,186	1881
Spain.....	201,237	16,625,560	1877
Portugal, including Azores and Madeira.....	85,131	4,550,699	1878
Italy.....	115,415	23,452,639	1881
Greece.....	92,575	1,979,428	1882
Roumania.....	51,973	5,376,000	1881
Servia.....	19,438	1,700,211	1880
Montenegro.....	8,612	236,000	1882
Turkey.....	62,175	4,490,000	1882
East Roumelia.....	14,861	815,573	1880
Bulgaria.....	25,531	1,998,938	1881
Bosnia, Herzegovina, Novi-Bazar.....	20,425	1,326,453	1879
Denmark.....	15,376	1,969,039	1880
Danish kingdom:			
Faroe Islands.....	593	11,220	1880
Iceland.....	40,914	72,438	1880
Greenland.....	80,000	10,000	1880
Danish Antilles.....	143	38,763	1880
Sweden.....	170,230	4,565,668	1880
Norway.....	180,170	1,918,500	1880
Russia.....	1,808,485	74,498,369	1879
Poland.....	60,924	7,104,760	1879
Finland.....	145,640	2,028,021	1879
Total.....	8,892,234	327,743,500	....

According to Behm and Wagner, the area of the territory which has been taken from Turkey and added to Greece is 5,340 square miles, and the population is 300,000. Considerable difference of opinion exists as to the boundaries between European Russia and Asia. If Strelbitsky's line be adopted, the area of Russia in Europe would be increased by 250,124 square miles, in addition to the number given above. The total area of Europe, according to Strelbitsky's calculations, is nearly 4,000,-

000 square miles. This includes the islands (with Iceland), 265,781 square miles, and the lakes, 87,880 square miles.

Coming to Asia, the usual difficulties are found in regard to Turkey. The latest available statistics as to population are those published in the "Salnamé" for 1879. Several changes in respect to Russia in Asia are to be noted, as also the large reduction made in estimating the population of China. The following table gives the results, as based on the labors of Behm and Wagner :

COUNTRIES.	Area in square miles.	Population.	Date.
Turkey .....	800,627	15,857,000	1879
Cyprus .....	3,707	180,916	1881
Russia in Asia:			
The Caucasus .....	190,060	5,500,554	1873-'80
Trans-Caspian .....	182,827	203,000	1873-'80
Siberia .....	4,995,043	8,800,200	1873-'80
Central Asia .....	1,807,104	5,000,000	1873-'80
Turkoman region .....	92,600	400,000	1873-'80
Khiva .....	24,120	700,000	1873
Bokhara .....	97,600	2,000,000	1873
Arabia (including Sinai and the Syrian Desert) .....	1,800,640	5,000,000	1880
Persia .....	668,828	7,600,000	1881
Afghanistan .....	388,660	3,500,000	1881
Kafiristan .....	22,674	400,000	1881
China (proper) .....	1,809,876	840,000,000	1881
Tributaries:			
Mantchooria .....	3,412,430	20,180,000	1881
Mongolia .....			
Thibet, etc. ....

Total .....	21,418,480	799,823,000	.....

Africa presents several changes, and the estimates are proportionately uncertain, to say nothing of the fact that a very considerable portion of this quarter of the globe has never as yet been explored. The following table gives probable estimates, and approximates at least to reasonable certainty:

COUNTRIES.	Area in square miles.	Population.	Date.
Morocco .....	824,972	6,140,000	1877-'80
Tunis .....	46,500	2,100,000	1877-'80
Tripoli, etc. ....	418,340	1,010,000	1877-'80
Sahara .....	2,472,170	3,500,000	1877-'80
Egypt (proper) .....	874,110	6,588,774	1877-'80
Libyan oases and Soudan .....	820,650	12,816,226	1877-'80
Central Soudan .....	685,990	31,500,000	1877-'80
Senegambia .....	350,000	12,000,000	1877-'80
Sierra Leone .....	468	60,546	1881
Lagos .....	1,200	75,270	1881
Gold Coast .....	16,626	408,070	1881
Liberia .....	14,880	1,050,000	1881
Abyssinia .....	138,312	3,000,000	1877
Galla and Somali Lands .....	768,800	15,700,000	1877
North equatorial regions .....	910,980	37,000,000	1877
South equatorial regions .....	697,150	80,000,000	1877
Portuguese possess'ns, W. ....	823,760	9,000,000	1877
"  E. ....	896,460	1,000,000	1877
South African states .....	2,502,038	26,296,850	1877

Total .....	11,929,300	205,823,200	....

In regard to America, the materials are only partly satisfactory. The accompanying table gives the result which is at present best attainable:

COUNTRIES.	Area in square miles.	Population.	Date.
Northwest Territory:			
Assiniboia .....	95,000	About 50,000	1881
Saskatchewan .....	114,000		
Alberta .....	100,000		
Athabasca .....	122,000	1,928,228	1881
Ontario .....	107,780		
Quebec .....	198,355		
New Brunswick .....	27,232	821,233	1881
Nova Scotia and Cape Breton .....	21,781	440,572	1881
Manitoba .....	150,000	65,954	1881
Prince Edward Island .....	2,173	108,891	1881
British Columbia .....	366,000	49,459	1881
British Territories .....	2,946,938	150,000	1881
Newfoundland .....	42,734	181,758	1881
French possessions .....	92	5,000	1879
United States .....	3,580,242	50,155,783	1881
Mexico .....	778,813	9,577,000	1880
Guatemala .....	40,777	1,315,210	1881
Honduras .....	47,192	350,000	1881
British Honduras .....	7,000	20,710	1881
San Salvador .....	7,380	300,000	1878
Nicaragua .....	58,120	350,000	1877
Costa Rica .....	20,704	185,000	1874
Panama .....	80,000	220,000	1870
West Indies .....	94,791	4,200,000	1879-'81
French Guiana .....	48,565	36,000	1879
Dutch Guiana .....	47,710	68,525	1879
British Guiana .....	88,497	248,110	1879
Venezuela .....	451,046	2,400,000	1881
Colombia .....	350,000	3,000,000	1881
Ecuador .....	250,000	1,100,000	1881
Peru .....	448,000	3,800,000	1876
Bolivia .....	518,920	2,000,000	1876
Chill .....	214,874	2,420,000	1881
Argentine Republic .....	1,164,387	2,540,000	1880
Uruguay .....	74,728	488,245	1880
Paraguay .....	95,316	298,290	1880
Brazil .....	3,494,887	11,108,291	1880
Total .....	15,889,250	100,415,400	....

These results are given with considerable confidence, although it must be confessed that there is no great certainty as to points of detail.

**EARTH-TREMORS.** Recent investigations have shown that the crust of the earth is in a constant state of vibration. Besides the violent shiverings called earthquakes, there are vibrations of the same nature, but of microscopic extent, which take place constantly over the whole surface. These microseismic tremors have hitherto escaped observation, although they are among the most universal of natural phenomena, because they can only be perceived by the aid of the most delicate instruments. There is another kind of movement affecting the earth's mass which is called oscillation. An increase in the barometric pressure will produce flexures in the surface of the earth which may be measured in inches, but which, like the earth-tremors, have been overlooked by scientific observers for the reason that the period of vibration is so long.

Earth-tremors are generally due to two causes: to the removal of barometric pressure, or to the passing of the tides. The release of the earth's mass from the superincumbent weight of air or water produces a quivering of the earth. The hugeness of the earth accounts for the fact that variations in the weight of air or water resting upon it are followed by elastic oscillations. Sir William Thomson explains the principle by the illustration of a mass of jelly, which the greater its size, the more it would be depressed by any weight resting upon it, and the more it would vibrate upon the removal of the load.

The first announcement of microseismic movements was made by Timoteo Bertelli, in 1870, who declared that he perceived in Florence the earthquakes which occurred in Romagna. Observations of minute earth-movements were instituted in Italy by Professor De Rossi in 1874. It was these observations which established the fact that microseismic storms follow the removal of barometric pressure. It was also noticed that these disturbances occurred sometimes simultaneously over the entire Italian Peninsula. The microseismic vibrations have also been studied in Japan. Local tremors of artificial origin, as when a railroad-train passes, have often interfered with delicate scientific observations in populous districts.

A committee, consisting of George H. Darwin, with his brother, Horace Darwin, Sir William Thomson, and others, was appointed by the British Association to determine the extent of the lunar disturbance of gravity. The work was conducted by the Darwins and Sir William Thomson at Cambridge. But it was found that the lunar changes in the plumb-line were rendered indistinguishable by the constant trembling of the earth. This was the first time that the vibrations from natural causes had been noticed in England. A mountain-mass depresses the yielding earth, and in plumb-line observations the deflection caused by the attraction of the mountain, and the apparent deflection due to the slope produced by the weight of the mountain, are superimposed, and the ap-

parent displacement of the plumb-line is exaggerated. The heaped-up air in an anti-cyclone would, in like manner, produce a depression of the earth's surface, and the attraction of the increased mass of air would cause a deviation of a plummet or pendulum. The effect of the ocean-tides is of the same order. The piling up of water against a shore at flood-tide causes the land to sink through a perceptible distance, and the retreat of the tide causes the land to rise, the slope of the flexures making the flood-tide higher and the ebb-tide lower. The elevation of the soil between the spring and neap tides varies as much as five inches. The deflections of the plumb-line due to these several causes are of the same order as that produced by the moon, and are sufficient to eclipse the lunar disturbance of gravity. As far as sixty miles from the coast the deflection due to tidal action is calculated to be as great as the maximum deflection of the plumb-line due to the direct action of the moon.

Earthquakes are the result of a complexity of causes, and are among the rare and irregular phenomena which can be studied with difficulty. The earth tremors and oscillations, on the other hand, are of continual recurrence, and depend upon natural laws which are known for the most part. It is a question whether the frequent disturbances of the earth's magnetism are not caused by microseismic storms, since it is known that earthquakes produce electric disturbances of great magnitude.

A series of observations upon earthquakes was instituted in Switzerland in November, 1879. From the first report, extending to the end of December, 1880, it appears that there were twenty-six earthquakes felt in Switzerland during the thirteen months. Many of these were of slight force, and consisted of a single shock. It was often possible to distinguish between one principal shock and a number of secondary ones, as if the strata which had been shaken violently had cracked and broken. The surface over which the earthquakes were felt extended from less than three and a third to over three hundred and fifty miles in diameter. Half of them affected only an area of less than twelve square miles, and three were felt over one thousand square miles. The great earthquakes at Chios, in 1881, lasted six days and consisted of thirty or forty shocks, any one of which was sufficient to destroy buildings. The soil seemed to dance up and down with the powerful vibrations. The earthquake in Casamicciola, by which one hundred and fifty lives were destroyed, was entirely local. This one was caused by the washing of the hot springs in the vicinity. The posts established by Professor De Rossi, of the Papal Academy, at Nuovi Lincei, recorded two hundred and forty-four perceptible earthquake-shocks in Italy in 1881. In the Italian stations the form of the motion, its intensity, direction, and speed, are studied. The vibrations from powerful earthquakes ex-

tend very far over the surface of the earth, and become longer as the distance from the center is greater. The great Lisbon earthquake of 1755 is known to have made the water in the pools and lakes of England wash from side to side as in a basin which is tilted. The unexplained rise and fall in the waters of the Swiss lakes, and in the great lakes of America and the Baltic, may be connected with seismological phenomena.

Earthquakes are now held to originate most frequently in the expansion of gases and vapor of water inside the crust of the earth. All the great volcanoes are situated near the sea, and emit during their eruptions immense volumes of steam. The effect noted by Perrey, of Dijon, that earthquakes occur with the greatest frequency at the perigee of the moon and its conjunction with the sun, which led him to suppose a tidal action of the conjectural fluid interior of the earth, can be explained by the pressure of the tide-water which causes more water to penetrate the interstices of the rock into the local caldrons, which produce earthquakes and volcanic eruptions. M. Daubrée announced to the French Academy of Sciences in June, 1882, that the water in the drainage-trenches of the English Channel Tunnel rose and fell with the tide. An increase of earthquakes has also been noted after rains and inundations. The influence of the tides is not, however, very strong, since Dr. Schmidt has collated the reports of three thousand earthquakes, and even found a maximum at the perion of the full moon, while De Rossi, Grablovitz, and Mercalli have noted similar anomalies.

**ECUADOR (REPÚBLICA DEL ECUADOR).** The territorial division of this country has recently been modified by the formation of a new province, Veintemilla (named after the present Dictator), corresponding to the old province of Carchi, and having for its capital Tulcan.

The Chief Magistrate of Ecuador is General Ignacio de Veintemilla, inaugurated as President in December, 1876—"Supreme Chief," in virtue of the *pronunciamiento* of April 2, 1882. The First Designado (or Vice-President) was Señor L. Salvador; and the Second Designado (or Second Vice-President), Señor F. Arias.

The Cabinet, at the end of the year, was composed of the following Ministers: Interior and Foreign Affairs, Señor F. Arias; Finance and Public Works, Señor de Icaza; War and Marine, Señor Echeverría.

The Governor of Guayaquil was General J. Sanchez Rubio.

The army in time of peace is usually about 1,200 strong.

In the absence of official returns it would be difficult to ascertain the precise condition of the national finances at the present time; but it may be stated that the revenue seldom exceeds \$2,500,000, while the expenditure rarely falls short of \$3,500,000.

The usual sources of income have grown much more productive than in former years; but the maximum aggregate revenue hitherto registered for any one year has been 3,594,000 pesos.

According to the report of the proceedings at a meeting of the bondholders called (in London) in 1881, for the purpose of obtaining sanction to a resolution proposing the basis of an arrangement which it was hoped might be effected with the Government of the Republic, the principal of the foreign debt of Ecuador, as agreed upon in 1854, was £1,824,000, bearing interest at one per cent, with the possibility of a rise should the yield of the Guayaquil custom-house exceed \$400,000 per annum. No increase of rate had ever been obtained, notwithstanding the marked improvement in the customs receipts at the port just mentioned; indeed, payment of the stipulated rate had only been made for about twelve years, when it was totally suspended. The arrears of interest amounted, at the time of the meeting, to £264,480, and the aggregate indebtedness, consequently, to £2,088,000, which it was then proposed to convert into £950,000 of new five per cent bonds. The home debt was stated to amount to 7,250,000 pesos at the beginning of 1877. Interesting details relating to the foreign debt were given in the volumes of the "Annual Cyclopædia" for 1874, 1875, and 1881.

The foreign trade of the republic is chiefly carried on through the port of Guayaquil. The staples of export are cacao, Peruvian bark, India-rubber, hides, ivory-nuts, coffee, and gold-dust. Foremost in importance among these commodities is cacao, the quantity annually shipped being of the average value of 6,000,000 pesos. The shipments of cacao for 1882 were but 18,904,693 pounds, against 22,308,235 pounds for 1881, and 31,546,657 pounds for 1879. Next in order is Peruvian bark, the trade in which has been rapidly increasing for some few years; ivory-nuts rank immediately after the bark, and these are followed by India-rubber. The exports of the last three articles are of the mean annual value of 450,000 400,000, and 350,000 pesos respectively. The coffee-shippments are less uniform in importance: those for 1878 were of the value of 182,385 pesos, while those for 1879 did not reach one half of that amount.

The exports to the United States were as follow in 1882: hides, 1,233,890 pounds; India-rubber, 933,111 pounds; cacao, 1,323,091 pounds; Peruvian bark, 139,745 pounds; ivory-nuts, 159,897 pounds; coffee, 10,000 pounds; sarsaparilla, 4,558 pounds; the aggregate value of the shipments, including 1,817 pesos in specie, having been 1,288,043 pesos, against but \$1,049,220 for 1879. The imports from the United States for the year last mentioned were of the value of \$1,148,350.

From the figures of the following table it will be seen that the trade between Great Britain

and Ecuador is not only more considerable than that between the United States and that republic, but steadily growing in importance:

YEAR.	Exports to Great Britain.	Imports from Great Britain.
1876.....	\$1,292,595	\$1,126,865
1877.....	928,955	1,259,375
1878.....	1,498,920	1,000,555
1879.....	2,615,860	1,409,925
1880.....	3,286,655	1,761,565

No more recent report of the shipping movements at the port of Guayaquil has been published than that given for 1879 in the "Annual Cyclopædia" for 1881.

There are at present seventy-seven miles of railway completed in the republic.

For many years past little tranquillity has been enjoyed within the borders of this, perhaps, the most distracted of all the Spanish-American republics, not excepting Venezuela; and the people, though rarely exposed to the horrors of civil war, have been so harassed by the misrule and abuses of reckless despots as to be impeded from continued and energetic application to their pursuits, to the very great detriment of the industries and commerce of the country. The Dictator García Moreno, assassinated in 1875, was succeeded by a constitutional President, Dr. Antonio Borrero, who inaugurated a new order of things, but from whose hands the power was wrested before the lapse of a year by the disloyalty of one of his trusted officials. General Ignacio Veintemilla, to whom Borrero had confided the important military command of Guayaquil in an hour of threatening peril for the Government, used the troops committed to his charge to depose his chief and cause himself to be proclaimed President of the Republic. Veintemilla's term of office, under the articles of the present (eighth) Constitution, should have expired in August, 1882; but, not satisfied with six years of power, he voluntarily provoked a revolution which might enable him more surely to accomplish his design to cause himself once more to be declared "Supreme Chief," or Dictator, as he had already done in 1878.\* It had been arranged beforehand that the *pronunciamiento* should be simultaneous in Guayaquil, Quito, and the other principal towns of the republic. The Dictator, in the decrees relating to this mock revolt, styled himself "Supreme Chief by the unanimous vote of the people"; but events soon transpired which revealed the real nature of that vaunted unanimity. The fictitious *pronunciamiento* was immediately followed by a genuine one in every part of the country, the expressed determination of a people, irritated beyond further endurance, to rid themselves of the terrorism of Señor Veintemilla. How unanimous this resolution was has been demonstrated by the fact that, in the course of a few months, the

Dictator was forced to take refuge in his last stronghold—Guayaquil. The first province to rise in arms was that of Esmeraldas, north of Guayaquil, which took place in April; but, unfortunately for the cause, the leader of the movement was a person at once incompetent and presumptuous. The main body of the Government troops, having taken up their position in Esmeraldas, had intrenched the town, and seemed determined to remain there for the purpose of sustaining the Dictator's supremacy in the north. The revolutionists, comprehending that possession of the place was indispensable to the success of their efforts, attacked it in August, and were repulsed, the intrepidity of the besiegers, for the most part Colombians, having been, it is said, more than counterbalanced by the incapacity of their leader, Alfaro. A second and successful attack was made in January, 1883, under General Salazar, whose services had been arrogantly refused some months previous by Alfaro. The Government forces, before abandoning their positions, sacked the stores and dwellings, and set fire to the town in three places. They then took refuge on board a steamer, the Huacho, and were conveyed to Guayaquil. In the mean time the revolutionary movement had become general in the interior; the Government garrison, seven hundred strong, in Quito was attacked by a republican (revolutionary) body of volunteers, numbering one thousand, under Colonel Sarasti, a lawyer and impromptu soldier. The latter, General Salazar, and Colonels Landázuri and Reynaldo Flores, are named as the officers who have taken the most active and distinguished part in the struggle, and as those to whose efforts was mainly due the desperate, almost hopeless, situation in which the Dictator found himself in the last week of January.

EDUCATION AND ILLITERACY. The subject of public education has been acquiring new interest and importance of late, not only in the United States, but in European countries. The statistics of the decennial census of 1880 show the extent of illiteracy in the Union, and the Bureau of Education furnishes figures exhibiting the provision made for popular education in the several States. Of the entire population of 50,155,783 in the United States, 36,761,607 are returned as ten years old and upward. Of these persons 4,923,451, or 13·4 per cent, were unable to read, and 6,239,958, or 17 per cent, were unable to write. Of the total population ten years old and upward, 82,160,400 were white, and 4,601,207 colored. The number of the former unable to write was 3,019,080, or 9·4 per cent of the whole, while of the latter 3,220,878, or 70 per cent, are unable to write. Of the whites 25,785,789 were natives of the country, and 6,374,611 were foreign-born. Of the former 2,255,460, or 8·7 per cent, could not write, and of the latter 763,620, or 12 per cent. The percentage of illiteracy, taking inability to write

\* See the "Annual Cyclopædia" for 1878, p. 260.

as the test, varied greatly in the different States, and was perceptibly affected by the proportions of colored and of foreign-born population. The highest percentage of all was in the Territory of New Mexico, where it was 65; but the next, 55.4, was in South Carolina, which has the largest proportion of colored inhabitants. Other percentages above 25 were: Alabama, 50; Georgia, 49.9; Mississippi, 49.5; Louisiana, 49.1; North Carolina, 48.3; Florida, 43.4; Virginia, 40.6; Tennessee, 38.7; Arkansas, 38; Kentucky, 29.9, and Texas, 29.7. These are all States with a large colored and comparatively small foreign population, but the ratio of illiteracy among the native whites is high in most of them: 25 per cent in Alabama, 25.5 in Arkansas, 20.7 in Florida, 23.2 in Georgia, 22.8 in Kentucky, 19.8 in Louisiana, 16.6 in Mississippi, 31.7 in North Carolina, 22.4 in South Carolina, 27.8 in Tennessee, 13.9 in Texas, and 18.5 in Virginia. The percentage of colored illiterates in these same States is as follows: Alabama, 80.6; Arkansas, 75; Florida, 70.7; Georgia, 81.6; Kentucky, 70.4; Louisiana, 79.1; Mississippi, 75.2; North Carolina, 77.4; South Carolina, 78.5; Tennessee, 71.7; Texas, 75.4; Virginia, 73.7. On the other hand, the rate among persons of foreign birth in those States was comparatively low: 7.7 per cent in Alabama, 5.6 in Arkansas, 10 in Florida, 5.6 in Georgia, 9.7 in Kentucky, 10.9 in Louisiana, 6 in Mississippi, 3.3 in North Carolina, 4.9 in South Carolina, 7.5 in Tennessee, 24.7 in Texas, and 5.4 in Vir-

ginia. The lowest percentage of illiteracy in any of the States, measured by inability to write, was found in Wyoming Territory, 3.4 per cent; the next in Nebraska, 3.6; and the next in Iowa, 3.9. Other States and Territories follow in this order: Maine, 4.3; Dakota, 4.8; New Hampshire, 5; Michigan, 5.2; Montana, 5.3; New York, 5.5; Ohio, 5.5; Kansas, 5.6; Connecticut, 5.7; Oregon, 5.7; Wisconsin, 5.8; Vermont, 6; Minnesota, 6.2; New Jersey, 6.2; Illinois, 6.4; Massachusetts, 6.5; Colorado, 6.6; Washington Territory, 7; Idaho, 7.1; Pennsylvania, 7.1; Indiana, 7.5; California, 7.8; Nevada, 8; Utah, 9.1. These are all in which the rate is below 10 per cent. The lowest rate for native whites is 0.7 per cent in Massachusetts, and the highest, outside of New Mexico, 31.7, in North Carolina. The lowest rate for foreign-born whites was 3.3, in North Carolina, and the highest, 27.3, in Rhode Island. In Massachusetts it was 19.6; in New York, 12.5; in Pennsylvania, 15.1. The rate of illiteracy among the colored population in the North was much lower than in the South, and, as a rule, lower than that among foreign-born whites. In Massachusetts it was 15.1; in New York, 21.2; in Connecticut, 17.4; in Rhode Island, 23.6; in Pennsylvania, 27.1. The following table shows the number of persons ten years old and upward, in each State and Territory, and the number returned in 1880 as unable to read and unable to write, together with a comparison of the figures for white and colored persons unable to write:

STATES AND TERRITORIES.	Persons of ten years of age and upward.			White persons of ten years of age and upward.		Colored persons of ten years of age and upward.

Statistics relating to the provision made for proper education in the several States are presented with fullness and from the latest sources in the various articles on the States in this volume, but for the sake of comparison some general figures are here drawn from the latest re-

ports of the National Bureau of Education. The following table shows the total population, the school population, enrollment, average attendance, total number of teachers, and length of school year, in days, in the several States and Territories:

STATES AND TERRITORIES.	Total population.	School population.	Enrollment.	Average attendance.	Total number of teachers.	Length of school year (in days).

Most of the States have also permanent school funds, some of which exceed \$10,000,000 in amount, and yield more than half a million of income.

**NATIONAL AID PROPOSED.**—An effort has been made in Congress, thus far without success, to secure the adoption of a policy of national aid for public education in the several States to be distributed according to their needs as indicated by the statistics of illiteracy. The principal plan proposed contemplates an annual appropriation from the public Treasury for a series of years, and diminishing in amount from year to year, to be expended under the direction of the Secretary of the Interior, through a Commissioner of Education to be appointed for each State. The plan is opposed, on the ground that provision for popular education is very properly in the exclusive control of the States, and should be kept there. The theory which has thus far prevailed is,

that the people directly concerned and benefited should not only have complete direction of their educational interests, but should pay for the benefits enjoyed by themselves. The plan of national aid has not apparently met with public favor.

**IMPROVED METHODS OF INSTRUCTION.**—There has been a good deal of discussion in the United States in regard to improved methods of instruction and administration in public schools. The tendency in many of the States to develop special features of public instruction is meeting with opposition. It is generally contended that the efforts and resources of the public should be directed to imparting the rudiments of education in the most effective and complete manner, and that until this is done there should be no diversion of these resources and efforts to the higher or the special instruction of some. Objection is made to the higher branches in common schools, and to institutions of higher education maintained at public expense, so long as there is a considerable mass of population, especially in large cities, to which the benefits of elementary education are not brought. As to methods of instruction, the old way of following text-books closely, and learning much by rote, is discredited, and the idea is generally advocated of more teaching by objects and examples and actual application of principles. This is sometimes known as the Quincy method, inasmuch as it has been carried further in the schools of Quincy, Mass., under the effect of certain local influences, than elsewhere. As an illustration of the method of instruction and the principle adopted, it may be stated that when studying geography, for instance, the children are given no text-book on the subject during the first three years. In order to learn what is a hill, bay, cape, ocean, or other geographical formation, they are required to observe closely the natural scenery of the locality where they live, and to report what they have seen. By means of some moistened clay and a slab prepared for the purpose, the configurations in question are modeled by the classes. The memory is not crowded with definitions of political divisions, as a monarchy or an empire, and these subjects come up with greater interest, it is believed, when the child is advanced to the study of history. In the same way the purpose throughout is that of teaching things and ideas rather than mere words and names.

**EDUCATION IN FRANCE.**—As to the state of public education in European countries, the statistics are somewhat meager. Great advance has been made in France since the establishment of the republic. In 1872, when the population was 36,102,921, there were 18,324,801, or 36.9 per cent of the whole, who were unable to read or write. This, however, included 3,540,101 children under six years of age. Only 19,005,517, or 52.6 per cent of the population, could both read and write. Attendance at school was optional, and the Govern-

ment neglected to provide sufficient accommodation for the school population. Many of the poorer communes did little or nothing for popular education, and it was left largely to the religious congregations. Government aid to primary education in 1860 amounted to 5,424,035 francs; in 1870, under the empire, it was 9,817,513 francs; in 1877 it had risen to 22,035,760, and in 1882 the government assistance to the communes, to enable them to fulfill the requirements of the new primary education law, amounted to about 50,000,000 francs. In addition to this the departments spent about 25,000,000 francs, and the communes 60,000,000, for primary education alone. The statistics of illiteracy have been reduced to a very notable extent, and promise practically to disappear under the effect of the compulsory education act.

**IN BELGIUM AND OTHER COUNTRIES.**—State aid to education in Belgium has risen from 6,425,000 francs in 1870 to 20,400,000 in 1882. While attendance is still optional, every effort is made to place the rudiments of education within the reach of all. In Italy, also, a great advance has been made. The number of public elementary schools increased from 32,732 in 1870 to 41,108 in 1879, and the government grant for their support has risen from \$3,000,000 in 1873 to \$6,200,000 in 1882. The law makes attendance obligatory, and energetic efforts have been made of late to provide for its full enforcement. In addition to the action of the Government, local and private efforts have been greatly stimulated. In Prussia and some other German countries there are many endowed schools, but the government expenditure in that kingdom for the year 1882 was \$11,458,856, chiefly for the establishment of new institutions. Austria adopted a compulsory school law in 1868, at which time the bulk of the agricultural population of the country was illiterate. The government expenditure in aid of local effort to provide primary education under the law increased from \$2,300,000 in 1870 to \$6,500,000 in 1881. Russia, with a population of 78,500,000, of which 15,000,000 are of school age, has only 28,357 elementary schools, attended by 1,213,325 children. Of the government grant of \$9,000,000 to schools of all grades, less than half a million is devoted to elementary education.

**EDUCATION IN GREAT BRITAIN.**—Prior to the passage of the Elementary Education Act in 1870, Great Britain was accustomed to make parliamentary grants in aid of elementary schools. These amounted in 1868 to £680,425 for England and Wales. In 1882 they had risen to £2,749,863. The number of schools increased from 10,751 in 1872 to 17,614 in 1880, and the number of pupils from 2,397,745 to 4,240,753 in the same period. In Scotland the number of schools increased from 1,962 in 1872 to 3,056 in 1880, and the number of children in attendance from 206,090 to 404,618.

The parliamentary grants for Scottish schools for 1882-'83 amounted to £468,512. The number of elementary schools in Ireland is 7,522, pupils 1,031,995, parliamentary aid £729,868. The public schools established in England under the act of 1870 are known as "board-schools," to distinguish them from the great endowed institutions which have long been known as "public schools," and from the "national" schools, which are attached to the Established Church.

**BOARD-SCHOOLS.**—The board-schools are not absolutely free, but small weekly fees, varying from two to ten cents per week, are paid by the pupils. The bulk of their support comes from local taxes or rates, but there is a government grant amounting to \$3.50 to \$4 a year for each pupil. Attendance upon the board-schools where they have been established is compulsory, unless the parent elects to send his child to some other, and the denominational schools are, for distinction's sake, known as voluntary. It is said that though the accommodations and instruction in the board-schools are generally superior to those in the voluntary schools, the latter are, as a rule, preferred by people of means and social pretensions. The voluntary schools are allowed to share in the government aid, on condition that they do not carry religious instruction beyond a certain limit; that they follow the government schedule of study and submit to government inspection, and do not make their own charges exceed eighteen cents per week for each pupil. The total cost of board-school education in England and Wales, including London, is \$20.40 per year for each pupil, and in London alone it is \$28. This includes an allowance for invested capital. Leaving out the original cost of buildings, it is \$14.58 per year for each pupil in the whole country, and about \$20 in London. Each school-building contains three separate schools or departments: one for infants of both sexes, one for boys, and one for girls, each with a head teacher. Children are admitted to the infant department at three years of age, and few remain in the school after fourteen. The course of instruction above the infant department is divided into seven grades prescribed by the Government, each occupying a year. The schools open with religious exercises, but the pupils are not required to be present at these. The salaries of head-masters of boys' departments are \$1,000 to \$1,200 per year; those of mistresses of girls' departments, about \$600; of male assistants, \$550; of female assistants, \$400. Members of the school boards are elected for a term of three years, and receive no compensation. The London School Board consists of 53 members, divided among ten districts, the largest having eight and the smallest four. The London Board is contemplating the establishment of schools for "higher elementary education."

A new education code has been adopted for

England and Wales, to go into effect at the beginning of 1883, which simplifies to some extent the administration of the board-schools, but is taken up chiefly with the grades of instruction and requirements for examinations. Elaborate instructions were sent out from the Education Department to "her Majesty's Inspectors." These are taken up with minute directions about the details of studies, the methods of instruction, and the scope of examinations, the general purpose being to secure thoroughness in elementary studies and a close application to the business of the school. On the result of the inspection depends the amount of the grant to be received from year to year by particular schools. The circular deprecates all resort to corporal punishment, and directs that it shall never be administered by another than the head teacher, and that every instance be recorded in the "log-book."

**INDUSTRIAL SCHOOLS.**—Attention has been directed strongly of late to industrial and technical education. The City and Guilds of London Institute has established a college for this special object at Finsbury, and has begun the establishment of the central institution. The Technical College at South Kensington is constantly extending its usefulness, and the establishment of a technical school in each considerable town, and of industrial classes in the elementary schools, is advocated in England. A Royal Commission was appointed in 1881, and visited France and Italy for the purpose of studying the means of improving the taste and skill of artisans. One of the subjects on which they reported were the apprenticeship schools of France in which trades are taught. There is a very successful establishment of this kind in Paris, in which 250 pupils are taught at an annual cost of \$15,000. Three other municipal schools of the kind for boys and one for girls are contemplated in Paris and one at Boulogne. One already exists at Havre, and the system seems likely to extend rapidly. The Clock-makers' Guild of Paris has an apprenticeship school of its own, and there is a watch-making school at Cluses. The Government maintains similar institutions, one at Sèvres for porcelain-decoration, and another at the Gobelins factory. It is generally admitted that the superiority of French workmanship is due to the attention given to technical education and training, and a perceptible improvement in the quality of manufactures of various classes is said to have resulted already from what has been done in that direction in England.

**FRENCH SCHOOL LAW.**—An important event in the educational field in Europe is the adoption of the new law in France regarding primary instruction, which took effect on the 28th of March. Its chief purpose was at once to secularize elementary education and to make it compulsory. The first article of the act defines the scope of primary instruction, which is characterized in general as moral and civic. It comprises reading and writing; the language

and elements of the literature of France; geography, particularly that of France; history, particularly that of France down to our own times; some familiar ideas of law and political economy; the elements of natural science, physics, and mathematics; their application to agriculture, hygiene, the industrial arts, manual labors, and the use of tools; elements of design, modeling, and music; gymnastics; military exercise for boys and needle-work for girls. Article second declares that the public primary schools shall have one vacant day each week, besides Sunday, "in order that parents may give to their children, if they desire, religious instruction outside of the school-rooms. It is declared that religious instruction in private schools is a matter of option. Sections of the law of 1850 are abrogated which gave to ministers of various denominations a right of inspection, supervision, and direction in public and private primary schools. Article four makes primary instruction obligatory for all children from six to thirteen years of age, either in public or private schools or in families. A school commission is instituted in each commune, to have charge of the schools and look after the attendance of children. This commission is composed of the mayor, who shall be its president, one delegate from each canton, and, in communes comprising several cantons, as many delegates as there are cantons, designated by the inspector of the academy, and members designated by the municipal council in number not exceeding one third of the council itself. At Paris and Lyons there is a commission for each *arrondissement*, presided over by the mayor at Paris, and at Lyons by one of the adjuncts. It is composed of one cantonal delegate designated by the inspector of the academy, and members designated by the municipal council to the number of three to seven for each *arrondissement*. The term of office of the commissioners appointed by the municipal councils expires at the election of new councils. The primary inspector is a member *ex-officio* of the school commission. Provision is made for a certificate of primary study to be granted after public examination to children of eleven years or more, and those obtaining certificates are thereafter free from the compulsory requirements of the law. The parent or guardian of any child is required to give notice to the mayor of the commune, fifteen days before the time of entering the classes, of his intention of having the child taught at home, or sending it to a public or private school. Every year the mayor in conjunction with the school commission must prepare a list of all children from six to thirteen years of age, and notify the persons having charge of them, of the time of entering classes. In case no declaration is made by the parent or guardian, the child is entered in the public school, and notice is given to the person responsible for the child. Lists of the children enrolled are furnished to the directors of pub-

lie and private schools eight days before the opening of the terms. When a child leaves school, notice must be given to the mayor, with an indication of the provision to be made for its future instruction. In case of temporary absence, explanation of the cause must be given to the teacher, who is required to keep a register of attendance and make a monthly report of absences, with the causes, to the mayor and the primary inspector. Excuses for absence have to be submitted to the commission, and only sickness, death in the family, and accidental interruption of communication are to be regarded as legitimate. Other exceptional circumstances may be accepted at the discretion of the commission. This requirement applies to directors of private as well as public schools, and any disregard of it is reported to the departmental council, which has the power to impose penalties, including suspension for three months. If a child is absent as much as half a day four times in a single month, without an excuse satisfactory to the commission, the parent or guardian may be summoned, and, in default of satisfactory explanation or amends, may be subject to the penalty of having his name and offense publicly posted. Repetition of the offense may be brought to the attention of a justice of the peace, and dealt with under the penal code. The commission is allowed to grant leaves of absence in certain cases, not exceeding three months in the year, and subject to the approval of the inspector if exceeding fifteen days at one time. Attendance in part may also be dispensed with on the approval of the departmental council, in the case of children employed in industries or entered as apprentices. Children who receive instruction at home must submit to a public examination each year upon subjects corresponding to those taught to children of their age in the public schools. The jury of examination consists of the primary inspector or his delegate, a delegate of the canton, and one person qualified by a diploma of the university or a certificate of capacity. The judges are chosen by the inspector of the academy. In the examination of girls, the person holding a certificate of capacity must be a woman. If the examination of any child is unsatisfactory, the parent or guardian is required to send it to a public or private school, notifying the mayor of his choice. The school fund instituted by the law of 1867 is established in each commune.

**Grounds of Opposition.**—Opposition to this law, both when it was pending in the Chambers and after its adoption, was based on the features which make instruction wholly secular, and which make it obligatory. It was argued by the Clergy and by Catholics generally that moral instruction must necessarily be religious. An amendment proposed by M. Jules Simon, in the Senate, that teachers should instruct their pupils in their duty toward God and their country, was the subject of protracted debate on this point. The provision in regard to re-

ligious instruction outside of the school was regarded as far more rigid than that of the Belgian law of 1879. This allows religious instruction by ministers of the different forms of worship in the school-houses themselves before or after school-hours. The French law simply allows one day in the week which may be devoted to religious teaching outside of the school, at the option of parents. In other words, religious instruction is excluded from the schools, and relegated to the home or the Church. M. Waddington attempted without avail to secure an amendment which would allow ministers of religion to use the school-houses for instruction, on Sunday and other days, when there were no school sessions. The principle adhered to was that of a strictly secular use of the funds and appliances of primary education.

The compulsory clause of the law of March 28, 1882, is also specially objectionable to Catholics in France. According to a statement of M. Chesnelong, in 28,000 communes of France, having less than 2,000 inhabitants each, there are none of what are called "free schools" at all, and can be none on account of the general poverty of the people. Compulsory education, therefore, means compulsory attendance upon public schools of the state.

**LAW IN BELGIUM.**—In Belgium, on the contrary, education is not made obligatory, and nearly everywhere there are the free private schools in close proximity with those of the state. The parent generally has his choice between the two. In Belgium provision is made that instructors in the public schools shall be prepared in the normal schools of the state. In France there is no similar provision. In point of fact the teachers come very largely from the various religious "congregations." The law of January 22, 1881, in regard to primary normal schools, does not forbid religious instruction, but makes special provision for it. But when these teachers assume their functions in the primary schools, they are practically debarred from any inculcation of religious ideas, and this is a cause of complaint on the part of Catholics, especially as in the poorer communes they have no choice but the public schools, and are obliged to send their children to some school. In Belgium the school committees are appointed by the Minister of Public Instruction, and no regard is paid to the wishes of the communal authorities, and priests are not invited to serve. In France the commissions are constituted mainly by the communal councils, and priests are often selected. This has given special significance to the attitude of the Church toward the schools. It has been the policy of the ecclesiastical authorities to encourage the entrance of priests into the school commissions in those localities where there is a lack of the "free schools." In many cases special instructors have been engaged to look after the religious culture of children outside of the schools, in strict ac-

cordance with the law. In a circular, dated April 25th, Cardinal Donnet, the venerable Archbishop of Bordeaux, said the masters would do nothing contrary to the new law by meeting the scholars in the morning, before the hour for opening the school, for prayer and study of the catechism in a private room outside the school proper; and, where that was impracticable, he authorized the use of the church for the purpose. In Belgium the ecclesiastical authorities have held an attitude of discouragement to the secular public schools, even withholding the sacraments from those taking part in their management and instruction, or resorting to them for education. The different action shown by the Church in France is due to the obligatory features of the law, from which there is no escape without conflict with the state, and the lack of school facilities other than those provided by the state in most of the poorer and more sparsely peopled communes.

QUESTION IN SWITZERLAND.—An interesting and important question has been brought up in Switzerland by an effort to transfer the charge of public education from the local authorities to the Federal Government. By the elections of October, 1881, a considerable radical majority was returned to the Federal Assembly, and on June 14, 1882, the following decree was adopted by the two Houses, the National Council and the Council of the States: The Federal Council is charged to proceed immediately, through the Department of the Interior, to such investigation and study in regard to the situation of the schools in the cantons, as is necessary to assure the complete execution of Article XXVII of the Federal Constitution, and to authorize legislation on the subject. To place the department in a satisfactory position for this task, it is allowed a special secretary (Secretary of Public Instruction), with an annual compensation limited to 6,000 francs. His functions shall be determined by a special regulation of the Federal Council. This proposition occasioned a good deal of discussion, and met with warm opposition. As one result of school management in the cantons through the local authorities, the sentiment of the people in regard to religious instruction had been very generally satisfied. The provisions of Article XXVII of the Federal Constitution are the following: "The cantons provide for primary education, which shall be sufficient, and placed exclusively under the direction of the civil authority. It is obligatory, and in public schools gratuitous. The public schools may be attended by adherents of all confessions, without suffering in any way in their liberty of conscience or belief. The Confederation will take the necessary measures against the cantons which do not fulfill these obligations." This was claimed as a guarantee of religious freedom in the management of schools, and, as in most of the cantons there was a large preponderance of Catholics, the schools under local manage-

ment partook largely of a religious character. This fact has been regarded as the motive for the attempt to transfer the control to Federal authority under a Secretary of Public Instruction in the Department of the Interior. The decree for an investigation, etc., was justified by its advocates under the last clause of the article quoted above, on the ground that the cantons failed to fulfill their obligation to place the direction of primary instruction under the civil authority exclusively. It was, in fact, or at least was claimed to be, largely in the hands of the Church. The proposition of the Federal Council met with strong opposition, and it was urged that the public education was made by the Constitution a local affair of the cantons, and the Federal authority had no right or power to intervene, to deprive them of its control. The actual programme of the administration was indicated in a document issued by Councilor Schenk, of the Interior Department. His views were presented under six heads: 1. Interdiction of public schools based on religious confession. 2. Interdiction of public instruction by the religious communities. 3. A prohibition of confiding the inspection of schools to ecclesiastics. 4. A project for placing private schools under the regulation of the state. 5. Giving the state full authority in the control of education, but not clearly defining the line between Federal and cantonal authority as representing the state. 6. Establishing religious instruction, rather historical than dogmatic, at the option of the cantons, but apart from the regular hours and exercises of the schools. This programme excited the strenuous opposition of the Church, and of those jealous of a centralization of the powers of state in the Federal Council.

Under the Swiss Constitution a law proposed by the Federal Assembly must be submitted to a vote of the people provided 30,000 citizens, or eight cantons, make the demand. This process is known as the *Referendum*, and more than 200,000 signatures were affixed to the demand for a vote on the decree of June 14th. This number was unparalleled in the annals of the Constitution. Several of the cantonal governments also joined in the demand, and a warm canvass was conducted on this question. The vote was taken on the 26th of November, and resulted in the rejection of the decree of the Assembly by 307,352 to 167,221.

EGYPT, a principality, tributary to the Sublime Porte, which attained a semi-independence under Mehemet Ali, appointed Turkish Governor in 1806, who made himself master of the country by force of arms. His grandson Ismail, who succeeded as Vali, or Viceroy, in 1863, obtained further concessions from the Porte, including the right to bear the title of Khidiv-el-Misr, Persian-Arabic for King of Egypt, and the adoption of the Salic law of succession. Ismail involved the country in financial embarrassments in his desire to introduce European civilization and develop

Commander of the British Army in Egypt.*

its material resources. After the default of interest upon the bonds, France and England interposed in 1876, and procured the deposition of Ismail in 1879, after a mutiny in the army occasioned by his efforts to satisfy the European bondholders. He was succeeded by his son Tefvik, August 8, 1879. Mohamed Tefvik, born in 1852, is the sixth ruler of the dynasty of Mehemet Ali. A French and an English Controller-General were given joint supervision of the expenditures according to a decree of the Khedive issued November 10, 1879. An International Commission of Liquidation was appointed under a decree issued April 5, 1880. The Controllers gradually assumed direction of the entire administration, a condition of affairs which led to a movement for popular self-government in 1881, and, upon the refusal of the Khedive and the English and French Governments to sanction the scheme, to a rebellion in 1882, which was suppressed with British troops. The Egyptian war was the most momentous event of international interest which occurred in 1882. The financial complications which led to the interference of the Western powers, and the chain of circumstances which resulted in the revolt against the Controllers and the Khedive, with the diplomatic discussions anterior to the armed intervention of England, and the history of the campaign, are described in the following pages.

**AREA AND POPULATION.**—The total area of the Egyptian dominions, including the regions on the upper Nile and in Central Africa which were subjugated in 1874 and 1875, is estimated at 1,406,250 square miles, with a total population of 16,400,000. The area of Egypt proper is about 210,000 square miles, and the population, as officially estimated in 1878, is given as 5,517,627, divided between the inhabitants of the town districts or governments (Mohafzas) and the rural districts or provinces (Moudiries) and between the sexes as follows:

DIVISIONS.	Males.	Females.	Total population.
Lower Egypt.....	1,335,258	1,493,737	2,829,995
Middle Egypt.....	322,672	330,447	653,119
Upper Egypt.....	788,598	732,500	1,471,398
Towns.....	278,711	290,404	569,115
Total.....	2,725,239	2,792,388	5,517,627

The area of the annexed and conquered districts is estimated at 1,026,250 square miles, and the population at about 10,800,000, including Kordofan with 278,740 inhabitants, Darfour with some 4,000,000, and Nubia, the Soodan, and the Equatorial Provinces, with an aggregate population estimated at 6,500,000. The principal towns and their population in 1877 are: Cairo, 327,462; Alexandria, 165,752; Damietta, 32,730; Rosetta, 16,243; Suez, 11,327; Souakin, 4,600; Port Said, 13,294 (in 1881); Massawah, 2,744; El-Arich, 2,506; Ismailia, 1,897; Tanta, 60,000; Zagazig, 40,000; Syout, 27,470; Damanhour, 25,000; and Mansura, 16,170.

The foreign population of Egypt, not included in the above, was returned in 1881 as 68,560, divided between the following nationalities: Greeks, 29,960; Italians, 14,520; French, 14,010; English, 4,095; Austrians, 2,480; Spaniards, 1,000; Germans, 1,880; Persians, 752; Russians, 358; Americans, 140; Belgians, 140; Dutch, 120; Danes, 70; and Portuguese, 35—registered in the consular books.

**COMMERCE.**—The foreign trade of Egypt is very great, but consists largely of goods carried in transit. The values of the exports to and imports from the different countries in 1881 were as follow:

COUNTRY.	Imports.	Exports.
Great Britain.....	\$17,996,000	\$40,967,000
France.....	5,668,000	5,745,000
Austria-Hungary.....	2,574,000	2,338,000
Italy.....	1,450,000	3,647,000
Turkey.....	765,000	2,014,000
Russia.....	915,000	5,390,000
United States.....	723,000	245,000
Greece.....	88,000	502,000
Other countries.....	4,832,000	737,000
Total.....	\$34,514,000	\$64,588,000

Raw cotton is the largest article of export. In recent years the cotton-seed has been shipped in large quantities to England. The grain exports, including beans, are next in importance. These vary greatly from year to year. The shipments of raw cotton to Great Britain in 1880 aggregated 152,606,608 pounds; the average quantity for ten years was 169,000,000 pounds. The decrease is made up by the exports to other countries, 257,000 bales going to Great Britain and 179,000 elsewhere in 1881. Four fifths of the wheat exported and two thirds of the beans went to England in 1881. The exports of the principal classes of merchandise in 1881, compared with the preceding year, were in value as follow:

EXPORTS.	1880.	1881.
Textile materials.....	\$37,499,000	\$44,475,000
Cotton-seed.....	7,688,000	7,495,000
Cereals.....	11,415,000	7,082,000
Sugar.....	8,760,000	1,586,000
Gums, fats, and oils.....	1,019,000	1,305,000
Skins.....	500,000	655,000
Ostrich-feathers.....	487,000	325,000
All other exports.....	2,808,000	1,709,000
Total exports.....	\$64,616,000	\$64,588,000

The following were the values of the principal imports:

IMPORTS.	1880.	1881.
Textiles and clothing.....	\$14,568,000	\$13,436,000
Coal.....	2,913,000	4,331,000
Metals and metal manufactures.....	1,280,000	1,228,000
Drugs, colors, etc.....	1,654,000	1,502,000
Gums, fats, and oils.....	1,351,000	1,505,000
Fermented liquors.....	815,000	1,022,000
Machinery.....	608,000	1,115,000
All other imports.....	9,397,000	10,285,000
Total imports.....	\$32,586,000	\$34,514,000

The exports remained nearly stationary, while the imports increased from \$25,000,000

in 1879 to the above totals in the two succeeding years. There were about \$60,000,000 of specie imported and only \$12,500,000 exported in the three years.

The commerce of Alexandria and Port Said is carried on entirely with steam-vessels. Port Said has become the largest coal emporium in the Mediterranean, importing over half a million tons in 1881. British steamers of the aggregate tonnage of 305,000 sailed to English ports, and of 308,000 tons to Continental ports, while the ships of other nations trading with the Continent aggregated 521,000 tons. Odessa, Trieste, Dunkirk, and Genoa are getting increasing shares of the Egyptian trade.

**AGRICULTURE.**—The crop in Egypt depends upon the Nile. One foot difference in the rise of the Nile is estimated to be worth £2,000,000. The rise begins in June, and the fall in September. In the last hundred years there have been forty-five years of good floods, varying from twenty-four to twenty-seven feet; fifteen years of extraordinary floods; and a bad Nile, rising only from ten to twenty feet, for forty years. Irrigation is a great help. The *zowats* and jobbers who water the fields of the fellahen for £3 an acre have four hundred and seventy-six steam-pumps in operation, besides the 107,200 Persian water-wheels, which employ 60,000 animals and 150,000 men for six months of the year. American windmills could be used with the greatest advantage if it were not for the Arab prejudice against windmills. There are, according to the surveys, 1,100,000 acres of desert land which could still be easily reclaimed. The crop in Egypt has been estimated at £53,000,000, or £10 per acre, in good years. Mulhall's estimate for average years, of twenty-four feet rise, is only about £8 per acre, as follows:

CROP.	Acreage.	Yield.	Value.
Maize .....	1,884,000	55,000,000 bushels.	£8,500,000
Wheat .....	1,150,000	33,000,000 "	8,300,000
Beans .....	1,220,000	23,000,000 "	4,300,000
Barley .....	521,000	16,000,000 "	2,500,000
Cotton .....	872,000	290,000,000 pounds.	9,900,000
		10,000,000 bush. seed	1,800,000
Rice .....	50,000	4,000,000 fds sticks	400,000
Lentils .....	150,000	2,000,000 bushels.	800,000
Sugar .....	80,000	3,000,000 "	700,000
Flax .....	24,000	70,000 tons.	1,700,000
Clover, etc.,	390,000	6,000 "	400,000
Total .....	6,341,000	.....	£44,800,000

The above estimates include the rum, flax-seed, dates, and all other agricultural products. The excess of acreage is explained by the fact that a part of the land produces double crops.

**FINANCE.**—Ismaïl Pasha upon his accession in 1863 found the Egyptian debt about \$16,000,000, or \$3 per head of the population. When he was deposed in 1879 it had risen to \$500,000,000, or nearly \$90 per inhabitant. He had actually received of the four hundred millions of obligations he gave, which soon grew to

four hundred and fifty millions, only about \$210,000,000. The difference of 50 per cent or so was absorbed in bankers' commissions and in the discount at which the loans were taken. The amount of the nine loans, the first of which was contracted by Said, the last by Tefik, and the rest by Ismaïl, the amount received by them, and other particulars, are shown in the subjoined table:

DATE.	Face.	Net receipts.	Issued at.	Interest.	Sinking fund.
	Sterling.	Sterling.	Per cent.	Per cent.	Per ct.
1862....	£3,300,000	£2,640,000	83½	7	1
1864....	5,704,000	4,864,000	93	7	4
1865....	3,857,000	2,750,000	90	9	3
1866....	3,000,000	2,640,000	92	7	17
1867....	2,080,000	1,700,000	90	9	3
1868....	11,890,000	7,193,000	75	7	1
1870....	7,143,000	5,000,000	75	7	2½
1873....	32,000,000	17,810,000	70	7	1
1879....	8,500,000	5,992,000	73	7	1
....	£77,004,000	£50,589,000	..	..	..

The loans were negotiated with English and French banking-houses at the exorbitant interest shown in the above table. It is calculated that £90,000,000 has been already drained from the country in interest, that the actual debt of Egypt has been entirely repaid in the interest received by the bondholders, together with interest computed at 6 per cent. The loans of 1862, 1864, and 1866, negotiated with Goschen, were secured by the railroads, telegraphs, etc., and drew only 8½ per cent interest on the net amount; but the bondholders, in their haste to be repaid, attached embarrassing sinking-fund conditions, as did the takers of the loans of 1865 and 1867, negotiated through the Anglo-Egyptian and Imperial Ottoman Banks respectively, for which also 11 per cent annual interest was charged. The annual interest and sinking-fund charges on the £32,923,000 owing in 1870 were about 12 per cent. To meet them Ismaïl was already reduced to ruinous shifts, and his credit rapidly sank, until he was hopelessly enmeshed in the toils of usurers and speculators. The wheat and sugar crops were pledged in advance, interest and compound interest were mounting up, and he was obliged to pay 18 and afterward 28 per cent per annum for advances from the Anglo-Egyptian Bank. The contractors who were constructing the public works for which he had contracted the debts, took advantage of his difficulties to exact an extra margin of profit of 80 per cent. Concessions and contracts were obtained through the venality of officials by which small European capitalists rapidly became millionaires during the period of Ismaïl's reckless financiering.\* In 1873 he might still have been rescued from bankruptcy, by suspending

\* An example of the exorbitant profits reaped by European contractors is seen in the Alexandria Harbor works, which Sir Rivers Wilson made out to be worth intrinsically £1,420,000, but for which Sir George Elliot was paid £2,542,000 in cash, besides the interest during construction. The railroads and all the other enterprises of Ismaïl afforded an equal margin to the contractors.

the sinking funds, but Sadyk Pasha found his own profit in his master's embarrassments, and plunged him in irretrievable ruin. In 1874 an attempt was made to raise £5,125,000 by a forced loan, the Rouznameh internal loan, but not one half of it could be obtained. In 1874 Sadyk proposed to convert the whole debt, and arranged to pay 15 per cent interest and 2 per cent commission to the Anglo-Egyptian Bank for funds for that purpose. In 1876, soon after Cave had given his encouraging report to Lord Derby of the finances of Egypt, Sadyk stirred up the British bondholders by proceeding to convert all the debts into one, called the Unified, and giving the bankers who had advanced money an advantage over the old bondholders. Goschen came as the agent of the bondholders and compelled the Khedive to reverse this arrangement and give the holders of the earlier issues a bonus of 25 per cent of the capital and accrued interest, and a prior claim upon revenues of the railways and other public works. In 1877 the Viceroy handed over his Daira estates to meet the Daira coupons. The revenue from these, the Khedive's private estates, was \$2,250,000 a year. Mr. Romaine, Baron Maloret, and Captain Baring had already taken in charge the state revenues. It was impossible to satisfy the Goschen arrangement, although the fellahen were bastinadoed as they never had been before, and the taxes were collected in advance. When Mr. Romaine proposed to reduce the land-tax so that the people might live, Major Baring, on behalf of the bondholders, refused to allow it. In 1878 the International Courts levied on the Khedive's furniture, and he turned their officers out of his palace, alleging that it belonged to his mother. Sir Rivers Wilson and M. de Bli-gnières came at this crisis, and the Khedive handed over the whole direction of affairs to them, the first taking the rôle of Minister of Finance, the second of Public Works. They took away the only source of revenue which had not been given over to the bondholders—the domains of the khedivial princes, with a rental of \$2,150,000. They cut down the army budget and other items, and proceeded to negotiate a new loan with Rothschild on the security of this property. Baron Rothschild withheld the money when he found that the domains were already affected by a lien. In February, 1879, occurred in consequence the *émeute* of unpaid officers. The European ministers were dismissed by Ismail, as the only way to save his life and prevent a massacre of Europeans. Lord Salisbury and Minister Wad-dington resented this act, and compelled the Sultan to depose Ismail, and appoint his son Tefvik to reign in his place by a *hatt* which was issued in June, 1879.

In July, 1880, the International Commission made a new settlement of the debt, converting the floating debt into bonds, and fixing the total obligations of Egypt as given in the following table:

Unified .....	£57,776,240
Preferred .....	22,387,800
Daira .....	8,512,870
Domain .....	8,499,620
Moukabalah .....	7,500,000
Total .....	£105,876,630

According to the terms of this final settlement the unified debt was to draw 4 per cent interest; the preference debt, 5 per cent. The holders of the Daira and domain mortgage bonds were to have the net revenues from the lands. The Moukabalah debt belonged to a different category. It was a forced loan raised from the peasantry, who paid in the whole of the capital. For the payment in advance of six years' taxes they were promised the remission of half the land-tax after 1885. The debt was nominally £17,000,000, of which certainly £10,000,000 had been paid in by the peasants. The Moukabalah law was a ruinous device of the Khedive, while he was floundering in the nets of the foreign usurers and contractors, to raise money to meet his present obligations by sacrificing the source of supply. The Controllers and Sir Rivers Wilson, acting solely in the interests of the foreign creditors, not only repudiated the solemn engagement of the Khedive, whereby the peasantry were redeeming one half the land-tax in perpetuity, but boldly confiscated the millions which had been wrung from the peasantry. Ismail had himself revoked the Moukabalah law in 1876, and decreed compensation in the shape of 7 per cent annuities running sixty-five years; but at the demand of Goschen, who wanted the £1,500,000 paid in annually by the peasantry on this account, in order to redeem certain of the short loans, he almost immediately re-established it. If it had not been for Nubar Pasha and some Greek capitalists, who had purchased land at the reduced assessments, the holders of the Moukabalah obligations would have lost everything; but through the prayers of these individuals they were accorded £150,000 a year for fifty years. The preferred bondholders were guaranteed—the net receipts of the railways and of the port of Alexandria being reserved to meet the interest. If these sources were insufficient, they were given a prior claim upon the general revenues. The interest on the unified debt was to be paid out of the general revenues after the interest on the preferred bonds was paid up and the cost of Government within the limits fixed by the commission was provided for.

Ismail did not squander the capital borrowed in Europe, as has been often represented, since he actually paid out more than the entire proceeds of the loans on useful and productive public works. The total sum expended on public works during his reign was \$231,320,000, while the entire net product of the loans was \$210,000,000. The expenditures were as follow: On the Suez Canal, over and above the value of shares sold, \$33,850,000; 8,400 miles of Nile canals constructed at \$4,500 a mile, \$37,800,000; 430 bridges built, averag-

ing \$25,000 each, \$10,750,000; 64 sugar-mills, built and equipped with machinery, \$30,500,000; for Alexandria Harbor improvement, Greenfield and Elliot contract, \$12,710,000; to Dussaud Brothers for Suez docks, \$7,000,000; to the Paris syndicate for the Alexandria water-works, \$1,500,000; for construction of 910 miles of new railroads, \$66,805,000; for 5,200 miles of telegraph, \$4,265,000; for erection of 15 light-houses on the Mediterranean and Red Seas, \$940,000.

The value of the improvements wrought by Ismail has been variously estimated. The Suez Canal has been of slight economical value to Egypt. The irrigation canals were the great work of his reign. If they had been constructed by hired instead of forced labor, they would have cost £28,000,000 at the rates paid for excavating the Suez Canal. They have reclaimed no less than 1,373,000 acres from the desert, representing a gross annual product of £11,000,000, and a rental value of £1,400,000. Only half the sugar-factories established by Ismail have been kept at work, and more than two thirds of their cost was a sheer loss. The harbor-works at Alexandria, including a new harbor of 1,400 acres, return only  $1\frac{1}{2}$  per cent in harbor dues on the excessive price paid the contractors; but they are of great economical value to the country. The railroads and telegraphs constructed by Ismail yield 5 per cent on the outlay; £3,600,000 was expended during his reign on the 4,632 public schools established by him, and £900,000 was lost in the village banks which he started to save the fellaheen from the usurers. In the Nile Steamboat Company's shares he lost £155,000. In building palaces and opera-houses, and in entertaining European potentates, he expended over £1,000,000. The extravagances of Ismail were the wonder of the world, particularly his lavish hospitality to travelers of diplomatic, scientific, or artistic note, and his expenditures in introducing the French opera in Cairo. The sums which he spent in getting the Sultan to grant him the title of Khedive instead of that of Viceroy, and to decree the Salic law of primogeniture for the succession, have never been computed. The reason for his embarking so imprudently on a career of dazzling Oriental magnificence and display, and in gigantic schemes of public improvements, without counting the cost, was because he thought that the cotton famine, which yielded such enormous profits for the cotton product of Egypt during the blockade of the American ports, would be permanent, and that the freed negroes of the Southern States would never again work in the cotton-fields.

During the seventeen years of Ismail's reign Egypt certainly made great progress. The population increased from 4,833,000 to 5,518,000; the acreage cultivated from 4,052,000 to 5,425,000 acres; the revenue from £4,937,000 to £8,562,000; the imports from £1,991,000

to £5,410,000, and the exports from £4,454,000 to £13,810,000; the mileage of railroads from 275 to 1,185 miles; of telegraphs from 630 to 5,820 miles; of canals from 44,000 to 52,400 miles. Yet the intrinsic value of Ismail's improvements, the price for which they could be replaced, is not much more than £25,000,000, or one quarter the sum for which he gave his obligations, which are treated as the national debt of Egypt, to exact the payment of which France and England interfered, although there was no precedent for international intervention to enforce the payment of just and regular public loans. The three privileged loans, the domain, Daira, and preferred, which are secured by the most valuable assets of the Egyptian Government, amount to more than this sum, being £30,598,000 in all. For the £42,000,000 which the ex-Khedive actually received from the bondholders, the Egyptians have paid back in fifteen years over £60,000,000 in interest!

Besides the debt which Ismail saddled upon Egypt, he agreed to double the tribute to Turkey for the privilege of changing the order of succession; so that the Egyptians have to pay £5,500,000 a year for the blessing of being ruled by Tefvik Pasha, instead of Halim.

The financial system in Egypt rests on an enormous land-tax which can be collected, owing to the great productivity of the soil. The tax averages £1 per acre on the arable area. The tax yielded £4,793,000 in the beginning of Ismail's reign. The *Ouchory*, or tithe-lands belonging to the rich proprietors, were taxed at the average rate of 7s. per acre; the *Karadjî*, or lands of the fellaheen, at the rate of 23s. per acre; and the *Abadiéh*, or special grants, consisting mostly of new lands reclaimed from the desert, yielded an uncertain revenue, said to average 16s. per acre. The product of the land-tax, at the time of the deposition of Ismail, was as follows:

LAND.	Acres.	Tax.
Ouchour.....	1,829,000	£470,000
Karadjî.....	3,514,000	3,850,000
Abadiéh.....	620,000	500,000
Total.....	5,463,000	£4,820,000

The *corvée*, or compulsory labor on public works, from which the Abadiéh lands are exempt, is a heavy burden upon the Karadjî. Each village has to contribute one fourth of its adult male population for one month yearly to work upon the roads, canals, etc. The *awats*, or wealthy payers of tithes in charity, who hold the *Ouchory*, get their laborers exempted by paying twelve shillings per head annually.

The customs duties in Egypt are light, yielding only about a million sterling. The import duties are 8 per cent, the export 1 per cent, *ad valorem*.

The estimate of revenue made by Major Baring has been made good. The Egyptians have paid the interest on the public debt since

it was reduced to four millions sterling a year. The use of the bastinado in collecting taxes has diminished, and the peasantry have come of their own accord to pay their taxes. The value of land has risen 50 per cent, sellers are few, and the usurers, who used to lend at 60 per cent, have no customers. In 1881 there was a surplus of £321,265, nearly the same in amount as in the estimate. The surplus was calculated for to supply the deficiency in years of a bad Nile, and, when not thus needed, to be applied to the reduction of the debt. Nearly half a million of bonds were canceled with the surplus of 1881. The expenses of the Government were limited to a total of £3,450,000 a year, all revenue above that amount to go to the reduction of the debt.

The funded debt, divided into unified and preference bonds, was fixed by the Council of Liquidation at eighty and a half millions. The Egyptian bonds, as reported in April, 1878, were held as follow:

In England .....	£42,200,000
In France .....	80,100,000
In Egypt .....	6,900,000
Total .....	£79,200,000

The budget of income and expenditure was based on an estimate of £8,400,000, as follows:

REVENUE.	
Land-tax .....	£5,250,000
Railways and telegraphs .....	1,150,000
Taxes and customs .....	2,010,000
Total .....	£8,410,000

EXPENDITURE.	
Consolidated debt .....	£3,520,000
Suez shares .....	199,000
Moukabalah .....	155,000
Tribute to the Sultan .....	700,000
Administration .....	3,450,000
Surplus .....	886,000
Total .....	£8,410,000

**THE CONTROL.**—The intervention of England and France to procure the deposition of Ismail was based upon a sort of protectorate which they had exercised over the dynasty of Mehemet Ali since its establishment by the convention of 1841. The Council of Liquidation, which was appointed by the decree of March 31, 1880, was composed of commissions representing all the powers which had participated in the creation of the Mixed Tribunals—England, France, Germany, Austria, Italy, and Egypt. The chief motive for interference in Egypt was to prevent the speculations in Egyptian credit by the astute creditors from failure through the extravagance of Ismail. The law of liquidation, sequestering the revenues of the Egyptian Government to satisfy the demands of the creditors, was thoroughly carried out under the supervision of the two Controllers who were appointed for that purpose. To meet the semi-annual coupons the fellahen were robbed of their cattle and implements, and flogged and bastinadoed as before. The Controllers secured the bondholders' interests, as they were appointed to do. But, through

the initiative of the French Controller, De Blignières, they did more than this. On the strength of a provision which gave them a seat in the Cabinet with consultory powers, they took into their own hands the whole government of the country. Their administration was in many respects better than the Egyptians had been accustomed to. Certain important reforms were inaugurated. The *kourbash* became a less necessary concomitant in the collection of the taxes. They replaced the Turkish caste, which monopolized the appointments of the civil service, with European officials. This course only substituted one abuse for another. The old officials were inefficient and corrupt, but the Europeans were, many of them, as inefficient, and those who were experienced and capable administrators at home were incapacitated here by their ignorance of Arabic; while all of them drew salaries which were in proportion to those customarily paid in Egypt, and greatly in excess of what they could have earned in their own countries. There were at the beginning of the year 1,272 Europeans holding offices in Egypt, whose salaries aggregated £373,000 a year. The placing of these foreign officials over them was naturally felt to be one of the greatest grievances, and had much to do with the national revolt against the Control.\*

**EVENTS PRIOR TO THE REBELLION.**—The Controllers were at the same time the attorneys of the foreign bondholders, agents of the English and French Governments, and paid officials of the Khedive. They dictated the entire policy of the Khedive. Their action in taking the administration into their own hands, and putting foreigners in charge of all the principal branches of the administration at enormously increased salaries, aroused the enmity of the displaced official class, and jarred against the sentiments of patriotism and independence which exist in every country, although their existence among the Egyptians was contradicted, even after they contemplated war and devastation in conse-

\* The salaries paid to foreign officials in the different departments were reported by Sir Edward Malet, to his government, on May 18, 1882, to be as follows in the different departments, in Egyptian pounds: Cabinet of the Khedive, £3,000; Maleh Sanieh, £696; Presidency of the Council of Ministers, £452; Teft of Gizeh and Gizereh, £436; Ministry of Foreign Affairs, £2,088; Ministry of Finance, £17,200; General Control, £14,101; Direction of the Cadastral Survey, £26,787; General Inspection of the Octrois, £2,770; Light-house Service, £10,289; Mint, £144; Ministry of War, £3,351; Ministry of Marine, £2,691; Ministry of Public Instruction, £7,905; Administration of the Wakf, £2,094; Ministry of the Interior, £3,975; Government of Alexandria, £750; of Port Said, £370; of Suez, £163; of El Arish, £84; Municipality of Alexandria, £540; Cairo Police, £1,567; Alexandria Police, £2,793; Suppression of the Slave-Trade, £2,052; Marine Sanitary Council and Quarantine, £5,290; Council of Public Health, £6,084; Ministry of Justice, £6,843; Ministry of Public Works, £29,216; Railroad Administration, £29,761; Telegraph Administration, £6,193; Port of Alexandria, £3,681; Administration of Customs, £16,647; Administration of the Post, £19,509; Postal Steamer, £16,941; Salines, £162; Administration of the Public Domain, £25,042; Dairah Sanieh, £19,672; Public Debt, £16,227; Parquet Administration, £3,088; Court of Appeals, £14,971; Alexandria Court of the First Instance, £22,344; Court of the First Instance at Cairo, £14,212; Court of the First Instance at Mansourah, £8,869. Total, £373,491.

quence of these feelings. But there were sufficient grounds for disaffection already in the sudden revolution of the financial policy which the bondholders put upon Egypt in order to rescue their profits. The army was the first and the most powerful class to feel the pressure. The fact that the officers had not been paid for a long time, and the foreign creditors allowed no provision to be made for their pay, was the cause of the disturbances which furnished the occasion for the dethronement of Ismail Pasha. The disbandment of a large portion of the army, reducing a great majority of the officers to half-pay, caused a profound and perpetual dissatisfaction among the influential military class. Ismail's army had numbered 200,000 men, so that there were as many as 2,000 officers for the little army of 12,000 men.

Then the ousting of the native officers by the Turkish element, while complicating the situation, rendered the discontent more acute, gave it a more national and patriotic character, and brought it to an issue between the dissatisfied native officers and the Khedive. The affair of February 1, 1881, when the Khedive laid a treacherous plot to seize the persons of the protesting colonels, caused an open rupture. The colonels were in constant fear of secret assassination, and the Khedive of a military revolution. At length the timid Mohammed Tefik mustered up courage to attempt to remove the incubus, but his order to one of the three regiments to march to Alexandria was answered by the rebellious demonstration of September 9, 1881. The mutinous colonels at the head of the troops demanded: 1. The increase of the army from 12,000 to its normal and maximum legal strength of 18,000 men;\* 2. The dismissal of Riaz, who they thought was aiming at their lives, and the appointment as chief minister of Sherif, whose known integrity precluded the suspicion of a design to destroy them after their safety had been promised;

3. The convocation of a Chamber of Notables or National Parliament. The Khedive agreed to the change of ministers, and Sherif Pasha was prevailed upon to accept, with much reluctance, the duties of the trying position. After coming to an agreement with the military party, according to which he was to carry out the recommendations of their military commission and they were to allow one regiment to be sent away from Cairo, Tefik would make no promise to raise the strength of the troops, as it was subject to the international engagements by which the budget was limited. The matter of convening a Chamber of Notables he agreed to take into consideration; and finally, on the advice of Sherif, he decided to humor the newly-awakened national and popular aspirations which had been propagated by Arabi Bey and his adherents. The sudden enthusiasm of the intelligent and patriotic Egyptians for parliamentary institutions was due to the fact that their constitutional ruler had sunk into the position of a servile instrument of the foreign emissaries, and they thought that the Governments of England and France would not refuse to restore the usurped national liberties if a body of the most judicious and respectable men who could be selected, fulfilling the conditions of representative government, stood ready to resume them. Arabi, after hesitating for some time, obeyed the orders of the Khedive, and retired to Wargla, near the canal.

DIPLOMATIC CORRESPONDENCE.—At the prospect that the Egyptians would take the management of their internal affairs out of the hands of the Control, the two protecting and the suzerain powers began to stir themselves.

It became evident that harmony of action was difficult. England was willing at this time to have Turkey send a military force to Egypt under proper guarantees. France set her face against any action of Turkey; and England, who had thus far followed the lead of France, acquiesced in this also. The Sultan, in spite of protests, sent two commissioners to Egypt with "compliments and advice." They arrived at Cairo October 6, 1881. As a counter-move, at Lord Granville's suggestion, an English and a French ironclad were stationed in Alexandria Harbor, ostensibly to diminish the danger of a panic among the foreign population. The Sultan remonstrated, October 11th, on the ground that the menace of the ships would cause an agitation among the Arab population which would "not unlikely lead to a general revolution," while at the time, according to the reports of the Turkish emissaries, perfect order existed. Lord Granville replied that if disorder was at an end the recall of the Turkish envoys "would imply the termination of the incident, and would naturally be followed by the withdrawal of the ships." Hence the sudden return of the commissioners to Constantinople on October 18th. The ironclads sailed away two days later. In a dispatch of Lord Granville, dated November 4, 1881, in which "the

\* One of the principal demands of the military party, which was repeated by the Chamber of Notables, was that the army should be recruited up to its full lawful strength of 18,000 men. The dissatisfaction of the officers and men at the reduction of the army in 1879 was the first breath of the revolutionary storm. The army had counted 50,000 men under arms, with 200 guns, without the irregular troops. The firman of Tefik's investiture fixed the maximum strength at 18,000 men, and the pruning operations of the Controllers left only 12,000 men under arms. The Khedive was given the appointment of officers of the rank of colonel and under, but the Sultan reserved the right of nominating the general officers. The practice of impressing recruits arbitrarily was done away with, and the principle of universal military service was introduced by a law which went into force November 1, 1880. This law fixes the length of service at twenty years, four years of active service, six as *Redifs*, and ten as veteran reserves. As the military budget was kept down to the figure fixed by the Control, 373,000 Egyptian pounds (\$1,846,000), no attempt could be made to carry out the military law. The military age commences with the twenty-first birthday. The annual recruit has partly been chosen each January by lot, but evasions by bribery have been frequent; partly it was obtained by volunteer enlistment of fresh recruits, or soldiers who had served out their term of active duty. The uniforms, equipments, and arms of the Egyptian army were of European pattern. The infantry were armed with Remington rifles, the artillery with Krupp breech-loaders, most of them of 24-inch bore.

tie which binds Egypt to the Porte" was spoken of as a valuable safeguard against "foreign intervention" and "rival ambitions," the first sign was given of an intention to abandon the policy of constant co-operation with France on which the dual Control rested, and to act in conjunction with the Porte. Finally, an accommodation was reached between the English and French Cabinets, and a dual note, composed by Gambetta, was dispatched.

**THE NATIONAL PARTY.**—The programme of the National party embraced the following six points:

1. The National party accepted the existing relations of Egypt to the Porte, acknowledging Sultan Abdul-Hamid Khan as suzerain and rightful Caliph, but would resist to the uttermost any attempt to invade national rights or to degrade Egypt to the state of a Turkish pashalik, relying also upon the protection of the powers and particularly on England's guarantee of administrative independence.
2. They declared their loyalty to the Khedive and pledged themselves to support Mohamed Tevlik as long as he ruled in accordance with the laws and the principles of justice and in fulfillment of the promises made to the Egyptian people in September, 1881.
3. They acknowledged the services of the Governments of England and France to Egypt in furthering liberty and justice, and considered the European Control a necessity entailed by the financial situation, deeming its continuance the best guarantee for the welfare and prosperity of the land, and accepting the Egyptian debt as binding upon the national honor.
4. They renounced every connection with those who, in the interest of the Powers, are jealous of the independence of Egypt and seek to disturb the land; aware, however, that it is impossible by a merely passive attitude to preserve the liberties of a land which is governed in part by a caste to whom liberty is odious, the National party confided their interests for the present to the protection of the army, which for that purpose should be brought up to its full effective force of 18,000 men.
5. They declared the Egyptian National party to be a political, not a religious, association, which would receive into its ranks men of all races and creeds without distinction, Christians and Jews as well as Mohammedans, assuring equal rights to all.
6. They announced as the general object of the National party the moral and intellectual regeneration of the people through the better observance of the laws, the spread of intelligence and improved education, as well as through political freedom, which they esteemed the life-spring of the nation; and in pursuing this aim they relied not only on their own strength but upon the sympathies of the European nations which enjoy the blessings of self-government.

The National party complained particularly of the employment of strangers in the administration when there were Egyptians who would discharge the duties better at one fifth the cost. The exemption of Europeans from taxation and from obedience to the general law of the land were injustices which they requested to have abolished. The immunity of the fine residences of European merchants from all taxation, while the huts of their humble Egyptian neighbors were taxed 12 per cent on their valuation, was one of the international engagements established by the capitulations of the Sultan. The consuls-general possessed the power of conferring foreign nationality on Egyptians, and procuring thus their exemption from the tax on real estate and the tax on professions. The

effect of the conflicting attributes of the local police and the consular authorities was that, while the slightest injury practiced upon a European by an Arab was severely punished, Arabs could be defrauded, plundered, assaulted, and even murdered with impunity.

The classes which rallied around the national cause were: 1. The army, with the exception of the Circassian officers. 2. The learned Musulman class, consisting of the doctors and scholars of the Azhar University. 3. The Arab and Egyptian merchants of the towns. 4. The native artisans who read, or had read to them, the Arabic journals. 5. The village sheiks and their representatives, the members of the Egyptian Parliament. 6. The Coptic Christians, numbering about half a million. 7. The small section of the fellahen who lived within the influence of the thought of the towns. 8. The semi-nomadic Bedouins of the Delta. 9. The native and Levantine Jewish communities. 10. Most of the Syrian Christians, who are the most active, progressive, and intellectual section of the Egyptian population.

Opposed to the National party were: 1. The adherents of the vice-regal family, officials and courtiers, mostly Turks and Circassians, including the majority of the persons who speak French and mingle with European society. 2. The Circassians. The class called "Circassians" in Egypt are the descendants of the Circassian boys and Mamelukes who ruled Egypt in the last century. The Circassians and Turks form a wealthy aristocracy, but number together scarcely 15,000. 3. The Greeks, who are the financiers and money-lenders, and number some 34,000. 4. A portion of the Syrian Christian community; also money-lenders and speculators. 5. The European community.

**THE CHAMBER OF NOTABLES.**—The outcome of the military revolt of September 9, 1881, was the convocation of a Chamber of Notables, upon the advice of the new Prime Minister, Sherif Pasha, in compliance with the demands of the military party. The delegates to the Parliament were elected ostensibly by popular suffrage, every Egyptian over twenty-five years of age being entitled to a vote; but outside the large towns the sheiks, or head men of the villages in each district, chose the representative at an electoral convention. Officials were directed not to interfere with the free choice of delegates. The objects of the convocation of the Notables, as laid down by Sherif Pasha in the project submitted to the Khedive, and announced in the speech from the throne at the opening of the Chamber, December 26, 1881, were to consider generally the requirements of the provinces, the needed reforms in the various administrations—and more particularly the question of forced labor on public works—the collection of taxes, and the establishment of provincial councils. The tribute, the public debt, and all charges on the country arising out of the law of liquidation or

any international contract, were excluded from parliamentary discussion.

The Chamber of Notables was made up from among the *Omdes*, or district magistrates, of whom there are five or six hundred in Egypt. The Omdes are elected by the Sheiks-el-Beled, or village chiefs, of each district, from out of their number. The Sheiks-el-Beled are usually the wealthiest and most influential land-owners of their communes. They obey the Omdes as blindly as the fellaheen obey them. The entire administrative system is in the hands of these two grades of local magistrates, who owe their position to the choice of the people, among whom they must permanently reside.

The national movement was not set on foot by the military party, but was already in progress. The best men in Egypt of both religions were studying over some practical means of escape from the grasp of the united dominion. The grievances of the half-starved officers of the army and displaced officials were only incidents of a movement which proceeded from a sense of wrong pervading all classes. The native merchants and the city population had murmured for years at the privileges secured by firmans, which enabled their foreign competitors to leave them behind, and the hearts of the fellaheen were full of sullen rage against the invading horde who fattened on their labor. The public debt, which consumed two thirds of the taxes that ground them to the earth, was known to be a usurious imposition; but it was of Ismail's making, and its payment was required with unbending rigor by the Western powers. It was, therefore, accepted as a *kismet* from which there was no escape. The injustice of the repudiation of the Moukabalah, however, rankled in their souls. The shrewd and prudent leaders of the National party based their appeal for self-government on the full satisfaction of the claims of the bondholders as a prime condition. Sherif Pasha, the new Prime Minister, was, as the most distinguished and respected statesman in Egypt, a fit representative of the national aspirations before the outside world, while Sultan Pasha, the President of the Assembly of Notables, was more distinctly a guide and intellectual leader of the movement.

The project of organization, submitted to the Chamber by Sherif Pasha, embodied the usual forms of representative government, but did not permit it to trench upon the ground occupied by the Control. The members were to be elected for four years, to draw pay, and enjoy immunity from arrest. The sessions were to be annual, and opened by a speech from the Khedive or a delegated minister. Ministers or deputed officials could take part in the discussion. Ministers were to be responsible for acts infringing on the rights of the Parliament, and to be bound to furnish explanations of matters within the jurisdiction of the Chamber. The Khedive could dissolve the Chamber, but must order a new election, to take place

within four months. The Chamber should discuss and vote upon every law submitted by the ministry, and could express an opinion upon the budget. They could pass no laws except those laid before them by the ministers. No new tax could be imposed without being voted by the Chamber. The Khedive and ministers could act without the Chamber in urgent cases, but must communicate their proceedings. The old Chamber, established by Ismail Pasha in 1865, was a merely advisory body. Sherif Pasha wished to revive the Parliament in 1879, and introduce the principle of ministerial responsibility.

The Chamber of Notables, upon assembling, prepared another project, which would give them full constitutional powers. They declared, as had Arabi and the National party all along, that the Control and the liquidation settlement were inviolable; but they demanded that the budget should be submitted to them. As the estimates for 1882 had been prepared, they did not ask to vote the appropriations for the current year, but insisted on the right to discuss and vote supplies thereafter. They demanded full ministerial responsibility, requiring that the Khedive should not retain his ministers after they had lost the confidence of the Chamber. Also the initiative in legislation, to the extent that the ministry should consider laws originating in the Chamber; and, if it would not ratify them, that it should state good reasons for its refusal. They claimed, furthermore, the right to investigate the conduct of officials.

Sherif Pasha possessed the confidence of the English, and hoped to solve the difficulties of the situation. But the Nationalists insisted on giving the Notables the control of the administration and of public expenditures. On the 4th of January Arabi Bey was taken into the Cabinet as Assistant Minister of War. Weeks were spent in trying to negotiate a compromise between the ministers' project of organization and that of the Notables; but, the Controllers-General, instructed by their governments, set their faces firmly against all the demands of the Chamber.

The identical note of the Western powers, in which they declared that they would defend the Khedive from all inner and outer dangers, was based only on a vague and fugitive agreement. It was presented January 7th, and contained the following menacing language, which was understood to veto the demand for constitutional government in Egypt, and to warn the Porte against taking independent action:

The two governments are closely associated in their determination to ward off by their united efforts all causes of internal and external complications which might menace the order of things established in Egypt. They have no doubt that the publicly expressed assurance of their intention in this respect will contribute to prevent dangers which the Khedive's government might have to dread, which dangers, moreover, would certainly find England and France united to face them.

Lord Granville qualified his signature with the verbal explanation that he did not commit his country to any definite line of action. The Porte began, January 13th, to protest and to appeal to the European powers. Other powers insisted that Egyptian affairs were the concern of Europe, Italy taking the lead. On February 2d the Porte received an identical communication from the Russian, German, Austrian, and Italian embassies declaring that the *status quo* could not be modified without the consent of the great powers and the suzerain power. Gambetta, spurred on by the prospect of European interference and Turkish intervention, pressed the English Cabinet to act upon the note when the Notables showed themselves intractable. French marines were detailed for the expedition, and Great Britain was invited to co-operate with Indian soldiers. He urged that England's interest in the sea-route to India and France's position as an African power prompted them to speedy action, of which the powers could not justly complain. Lord Granville would not hear of a joint expedition, and, January 30th, proposed that Turkish troops should be employed to re-establish order in Egypt. Freycinet, on coming into the French premiership, was anxious to dispel the fears of an adventurous French policy which Gambetta had created. The attitude of France was immediately reversed. The new French minister opposed intervention, and proposed that the Egyptian Nationalists should be allowed to attempt the reforms which they had at heart. In one point the French policy remained firm and consistent, in resistance to the armed intervention of the Porte, even as the mandatory of the powers. Any exhibition of the power of the Padishah in Africa was supposed to imperil the peace of the Algerian dominions of France, where dangerous religious passions were already smoldering, and questions of sovereign rights had arisen which had created an estrangement between the republic and the Porte. The joint note of the four powers gave England and France an excuse for inaction. The British and French Cabinets addressed an invitation to the four powers for an exchange of views. Freycinet, for the sake of pleasing the Gambettists, gave offense both to England and to the protesting powers by sending instructions to Consul-General Sinkiewicz to maintain the preponderant position of France. The influence of France was further enfeebled by a conflict which arose between the French Controller and the consul-general, in consequence of which the restless and ambitious De Blignières was retired and M. Bredif appointed in his place.

The difficulty between the Government and the Notables came to a head February 3d.\* A

\* Why the British Government, if they had no ulterior purposes in view, refused to allow the Notables to attempt constitutional government, is a question involved in Egyptian darkness. Sir Edward Malet, the British consul-general, when interrogated as to the effect of allowing the Notables to vote the budget, replied that they might cut off the salaries

deputation from the Chamber offered Sherif Pasha the alternative of accepting their project of the powers of the Legislature or resigning his office. Sherif referred them to the Khedive, and, when called into the conference by the Viceroy, handed in his resignation. The deputation then requested the Viceroy to name a Cabinet. Tefvik answered that he had perfect confidence in Sherif, and that they must name their own Premier. After at first declining to infringe upon the prerogative of the Khedive, the deputies returned and presented the name of Mahmoud Baroudi, who was invited to form a Cabinet.

Arabi Bey, the popular leader of the revolt against the Europeans, emerged as Minister of War and Marine. The other appointments were: Mustapha Fehmi, Foreign Affairs; Mahmoud Bey, Public Works; Abdullah Fehmi, Public Instruction; Fetme, Justice; Ali Sadok, Finance; Hassan Kerey, Wakfs (Mosques and Charities). On February 6th Mahmoud Baroudi presented the programme of the new ministry, a Constitution such as was demanded by the Notables, infringing in no wise on the rights of Europeans and the financial settlements which were secured by international engagements. In a few days he announced to the Chamber that the Khedive had delegated to them the right to vote the budget in virtue of the powers conferred upon him by the firmans of the Sultan. The Controllers, Colvin and De Blignières, protested that the khedivial decree of 1879 gave them a seat in the Cabinet and a voice on all questions of finance. Their only legal argument was that the right to give advice implied that their advice must be followed.

The resistance of the powers to the constitutional demands of the Egyptians, and their threats of military intervention, gave the military party the lead. Arabi and six other colonels were made generals with the title of pasha, and twenty officers were promoted to the rank of colonel. There were 500 promotions made in the space of three months. Arabi talked of raising the effective of the army to 20,000, projected an arsenal at Suez, and planned the fortification of the sea-coast to prevent the landing of European troops. The anti-European feeling found vent in the dismissal of European clerks. The Chamber discussed the question of placing the cadastral survey under the direction of natives.

On the 11th of April Arabi Pasha arrested nineteen Circassian officers, and accused them of having formed a conspiracy to assassinate him and the other generals. No Circassian had received promotion, and Arabi was supposed to have formed the intention of sending them all to the Soodan. A number of Arab officers were subsequently arrested, among them Osman Zefki, former Minister of War,

of the officers of the survey, which were not provided for in the capitulations; so that it appears as though a question of salaries for some of the "locusts" led to war in Egypt.

on the charge of plotting in favor of the ex-Khedive. Arabi showed great fear of the machinations of Ismail. He had refused permission for his invalid daughter to land, and banished his business agent. There were fifty arrests made altogether, and on May 1st a court-martial condemned forty officers and two civil functionaries to loss of rank and banishment. Nualti Pasha, who was with Ismail at Naples, was condemned in *contumaciam* as the chief of the plot. The consuls protested. The Sultan was indignant that Circassians and officers whom he had decorated should be treated ignominiously. The Khedive withheld his signature to the sentence. He finally commuted it to simple exile, a decision which was displeasing to the ministers. They convoked the Chamber for May 14th, without the authorization of the Khedive, to lay the matter before it. Mohamed Tefvik, in his attitude toward the seditious ministers, showed unusual vigor. All intercourse was suspended between them and between the ministers and the Control. The English and French consuls and the Porte commended the course of the Khedive. The military threatened to depose Tefvik. The Notables disappointed them by refusing to sit illegally. Sultan Pasha declared that the Bedouins would march to Cairo to defend the Khedive, and Sherif Pasha and the Egyptian Sheik-ul-Islam came to his support. Finally, the President of the Notables and the late Prime Minister, with the assistance of the two consuls, arranged a reconciliation. Great Britain and France had by this time again composed their jealousies, and the Cabinets had agreed upon common action. They gave notice to the powers of a joint naval demonstration, for the purpose of fortifying the authority of the Khedive and preserving the *status quo*. The Porte, which lost no opportunity for asserting the authority of the Sultan in Egypt, addressed a reproof to the Egyptian ministry for summoning the Chamber unconstitutionally, and reminded them, in reference to their declaration that the landing of Turkish troops would be resisted with arms, that Egypt formed an integral part of the Ottoman Empire. This was offset by the watchful powers in a dispatch from the Khedive, rebuking the Turkish Prime Minister for holding irregular communications with his Cabinet.

ANGLO-FRENCH NAVAL DEMONSTRATION.—The English and French squadrons united in the Bay of Suda, off Crete. Mahmoud Pasha Baroudi appealed vainly to the consuls-general for assurances that the fleet would depart again at once when they entered Alexandria Harbor, protesting that all motive for a naval demonstration was taken away by the reconciliation of the ministers with the Khedive. Arabi then determined to answer the naval demonstration with a demonstration of Egyptian independence. He called on the provincial authorities to send the reserves to Cairo. They declined to do so without a formal command from the

Khedive. On the 20th of May the Anglo-French squadron anchored in Alexandria Harbor. The diplomatic representatives of the powers parleyed with the military party, and M. Monge, the French consul at Cairo, tried to bribe Arabi and the generals to leave the country with tempting offers of a career and emoluments. The warlike preparations went on. Artillerists were sent to Alexandria and Damietta. Torpedoes were sunk along the coast. At a council of war, held in the Abdin barracks, at Cairo, the generals took an oath to defend the country against any foreign intervention, and the sheiks and Bedouins joined them as against European, but not against Ottoman, intervention. They applied to the Controllers for money to prosecute the defensive preparations, and were naturally refused. The idea of abolishing the Control was discussed, but they reflected that it would render intervention inevitable, and would probably paralyze the action of the Porte and the East European powers which were opposed to the Anglo-French preponderance. The Minister of Wakfs had the disposal of a fund which was out of the reach of the Control. He at once handed over £300,000 sterling. On May 25th the French and English consuls made a formal demand that Arabi Pasha should undergo temporary expatriation, his coadjutor Ali Abdallah depart for the interior, and the ministry resign, promising their good offices to obtain amnesty for all who had rebelled against the authority of the Khedive. Lord Dufferin and the Marquis of Noailles at Constantinople took pains to explain to the Porte that the rights of the Sultan could not suffer through the dual intervention; that Turkish co-operation was unnecessary, since the sovereignty of the Sultan had not been called in question; but that if it should become necessary later he should be invited to participate. Abdul-Hamid knew the worth of such promises, and foresaw that an Anglo-French military occupation of Egypt would deprive the Padishah of the last shred of his sovereign rights. Since he was excluded from participation in the intervention, he did his utmost to paralyze the action of France and England in Egypt by appealing to the European powers to check their belligerent designs, and by giving encouragement to the National party in Egypt. In obedience to the ultimatum of the two powers, the ministers handed in their resignations to the Khedive. Mahmoud Baroudi artfully explained that they had unanimously advised the Khedive to return the Anglo-French note, on the ground that the foreign intervention was an invasion of the rights of the Sultan, but, since he had accepted it, their only course was to resign. Mohamed Tefvik accepted their resignations, and issued, at the same time, a proclamation declaring that the fleet had come for a peaceful purpose, ordering the enrollment of the reserves to be stopped, and announcing that those who had arrived at Cairo would be sent back to their

homes. He called to him a number of officers, among them Ali Fehmi and Abdallah Pasha, and announced that he would exercise the command of the army in person. He called upon them to submit to the conditions imposed by the consuls-general. They answered flatly that they would submit to no foreign dictation but that of the Porte. Tevfik sought in vain for new ministers. Sherif Pasha could not be persuaded to take office at this time. Members of the Chamber of Notables came to the Viceroy and begged him to retract his acceptance of the consular note, and retain Arabi as Minister of War. The whole corps of officers came on a like errand, and expressed themselves in forcible language. The military commandants at Alexandria sent word that they would take orders from no one but Arabi, and that they would not answer for the maintenance of order twelve hours if he were not reinstated. The deputies, the officers, and the ulemas met before Sultan Pasha and united in a demand for the retention of Arabi Pasha, while the officers talked about deposing the Khedive. Tevfik was still firm, and told Sultan Pasha, who presented the address, that the officers abused the name of the Porte, since the Sultan had sent a dispatch commending his conduct. Directly afterward he received another message from the Sultan, condemning the military party, and telling him to recommend moderation to all, so as to escape foreign intervention. Deputations from the university, from the native merchants, from every respectable body, brought the same request to the Khedive that he had received from the officers, notables, and ulemas. Pressed by all Egypt, he at last gave way, and restored Arabi to the Ministry of War. At this time the Khedive received a telegram from the Porte, in which the Sultan offered to send a commissioner to Egypt if the Khedive would make a formal request to that effect. Mohamed Tevfik applied to the consuls for advice. Here again the discordant note in the Anglo-French concord destroyed the effect upon the Egyptians and upon the Porte of the ministerial declarations, the common ultimatum, and the united squadrons. Mr. Malet did not object to the coming of a Turkish commissioner if it would prevent disorders, while M. Sinkiewicz was unqualifiedly opposed. France was constrained to give way when the European powers unanimously approved the Turkish mediation, and confined her efforts to preventing the intervention from taking a military form. A note of the dual powers, dated May 29th, demanded that the Sultan should confine himself to expressing approval of the course of the Khedive, and should command Arabi Pasha and the other military chiefs to come to Constantinople and give an account of their conduct. The Sultan refused to serve as the instrument of the two powers; so that they were restricted to demanding that the action of the Porte should not go beyond the sending of an envoy charged with the mission of inviting the army

to submit to the Khedive. De Freycinet, in his efforts to preserve the preponderance of France and the anti-Mussulman ends of the Gambettist policy, while avoiding its perils and adventurous aims, was left in the lurch by the British Cabinet, and found France completely isolated. Sustained by a vote of confidence against the objections of the Opportunists, he abandoned the policy of exclusion and preponderance, to enter the European concert. He proposed a conference of the ambassadors of all the powers at Constantinople, for the definite settlement of the Egyptian question. A dual note, based on Granville's declaration to the powers of the 11th of February, invited the Porte to the conference. It premised the preservation of the *status quo*, and the existing international engagements, which was unacceptable to the Porte and scarcely met the views of the powers. The Porte did not hesitate about sending the commission. Dervish Pasha was intrusted with this delicate business, with Achmet Ratid, Lebib, and the Sheik Ali Metstad, for his associates, and attended by an aide-de-camp and a numerous suite. The Sultan then informed the powers of their mission to restore tranquillity, maintain the *status quo*, and sustain the Khedive. In a second circular on the subject Said Pasha asserted that the regulation of Egyptian affairs was a prerogative of the Sultan, and that he saw no necessity for a conference. In Egypt, Arabi was still the only minister appointed, the master of the army, and the hope of the Nationalists; while the Khedive was powerless, and despised as the slave of the Europeans. The French consul attempted to constrain Arabi to submit to the ultimatum, and proposed to the Khedive to make Ragheb Pasha Prime Minister, and Abdallah Minister of War. Arabi declared, contemptuously, that the threats of France and England were as false as their promises; that if they should venture to intervene they would meet with a vigorous resistance. The Turkish commissioner was received with open arms by the Khedive. The National party professed devotion to the right, of the Sultan, and seemed disposed to place all their trust in the action of the Porte and the conference. Ragheb Pasha formed a ministry which was in accord with the Khedive. The truce in the political conflict was complete. There was every prospect that the appeal of the Egyptians to Europe for administrative independence would be eventually successful; that the conference would insist on the restriction of the Control and the diplomatic agents of the two powers to their legitimate functions, as the only peaceful solution of the question. The popular passions, however, rose higher with the prospect of the deliverance of the Egyptians from their enslavers. The smoldering resentment, hatred, and jealousy of the populace of Alexandria, where the privileges enjoyed by foreigners, their arrogance toward the natives, and the ostentatious display

of their extortionate accumulations were constantly seen and felt, were wrought up to a dangerous pitch, after long years of repression, by the sight of the ironclads in the harbor and Arabi's warlike preparations. The Europeans, who had all along clamored for intervention, were more overbearing and exasperating in their bearing than ever. On the 11th of June the mutual animosity culminated in riot and bloodshed in the streets of Alexandria.

**ALEXANDRIA RIOTS.**—In an ordinary street fight a Maltese stabbed an Arab. This incident drove the native population into a fury, just as a few months before a riot was imminent when a soldier was murdered by a supposed Italian. The Arab population of Alexandria collected in mobs and soon worked themselves into such a state of excitement that they began to break up the chairs and tables in the streets, and set upon every European who was found abroad. They burst into shops and invaded the European quarter, but were kept aloof by a fusillade from every house. About seventy Europeans and six or seven hundred Arabs were slain. The following day the Khedive, at the suggestion of the Turkish commissioner, imposed upon Arabi Pasha, who was the actual head of the military forces, the responsibility of keeping order. This arrangement, which was announced to be only provisional, completed the consternation of the Europeans. They fled panic-stricken, and in a few days all the wealthy residents had left Egypt, while the streets of Alexandria were filled with their starving dependents. On the 13th the Khedive proceeded with Dervish to Alexandria. The powers sent more ironclads, and labored with the Porte to have Turkish troops sent to Egypt. The Sultan refused to enter Egypt to execute the behests of the Western powers, and still held aloof from the conference. On the 16th of June, through the intercession of the German and Austrian consuls, the Khedive accepted a new ministry, which, however, the dual powers refused to recognize. Ragheb was retained as President of the Council, and Arabi Pasha was again made minister. Business was at a stand-still after the flight of the Europeans. A large proportion of the city population were left without food or shelter. The authority of the Khedive was effaced. He acted under the directions of Dervish Pasha, who was treated with respect. The Sultan's agent was secretly fomenting the rebellion. The only activity was in the bellicose preparations of the military. The government, as far as it existed, was in their hands. The country was aflame with the spirit of war. Arabi Pasha by his speeches infused into the meek fatalists of the Delta a holy ardor for the overthrow of the foreigner. While he enlisted and drilled soldiers, the conference wasted its time in interminable negotiations with the Porte. The Sultan sent a decoration to Arabi Pasha at this time. Toulba Pasha, the commandant at Alexandria, mounted guns and trained them

upon the ironclads. With boundless energy he constructed new forts and made thorough preparations to resist any attempt to land troops.

**MEETING OF THE CONFERENCE AT CONSTANTINOPLE.**—The conference met June 23d, at Therapia, on the Bosphorus, in the villa of Count Corti, the Italian ambassador, and dean of the diplomatic corps at Constantinople. Their first act was to sign a self-denying protocol, whereby each power promised not to be governed by its own interests, but to accept whatever solution of the Egyptian question the conference decided upon. The conference next approached the delicate question of the attitude of Turkey. They could not settle the affairs of Egypt without the assistance of the Porte, which had already formally declared the conference to be useless, and which met their overtures with the accustomed Fabian subtleties of Ottoman diplomacy. The next acts of the plenipotentiaries after the signature of the protocol of disinterestedness were a resolution renouncing isolated action, and one acknowledging the sovereign rights of the Sultan.

**BOMBARDMENT OF ALEXANDRIA.**—The English and French Cabinets saw that the Egyptians and the Porte would succeed in ousting them from the direction of Egyptian affairs, and that the council of ambassadors would approve the new state of things which was being established in Egypt. Sir Beauchamp Seymour, the admiral of the British fleet at Alexandria, had instructions, dating from the 15th of May, to land a force if necessary to protect the Khedive. By the act of this commander, England evaded the self-denying protocol and commenced a course of active intervention, while pretending not to have broken the European concert, nor to have departed from the engagements entered into at the conference. Egyptian soldiers to the number of 6,000, it was estimated, had been busily constructing earthworks and mounting guns since the 29th of May. On the 6th of July, Sir Beauchamp Seymour pretended to discover that the fortifications constituted a danger to his ships, and sent an ultimatum demanding that the work upon them should cease, or the fleet would open fire. The Porte demanded through the Turkish ambassador at London that the bombardment should be countermanded. Toulba Pasha, commandant of the garrison, protested that no hostile purpose was intended, and appealed to the "well-known humanity" of the English commander. The consuls of the foreign powers at Alexandria, surprised and alarmed at the sudden belligerent announcement, begged the British admiral to withdraw his menace until they had used their offices as mediators, but he held to the ultimatum. Promises were given that the works should be discontinued, and they were apparently deserted in the day-time, but it was seen that the guns were manned by flashing the electric light upon them on the night of the 8th, and a reconnoitering party

observed men mounting cannon in one of the minor forts. Declaring this a breach of the engagement, the commander of the fleet demanded on the 9th that the forts should be temporarily surrendered to the English, to be

The fleet was divided into two squadrons, one working inside the outer harbor, the other engaging the forts along the sea-front, while the Inflexible and the Téméraire placed themselves in the Corvette and the Bourgas Passes,

VICE-ADMIRAL SIR FREDERICK BEAUCHAMP PAGET SEYMOUR, G.C.B., COMMANDING THE MEDITERRANEAN SQUADRON AT ALEXANDRIA.

dismantled within twenty-four hours. All the foreign ships now left the harbor, while the British ironclads took position and cleared for action.

The western harbor, divided by a mole into the outer and inner harbors, was defended by Fort Ras-el-Tin at the extremity of the peninsula on which the town is built; by Fort Marabout, five miles distant, at the western end of the outer harbor; and by the powerful Meks fort, with eighty-one guns, at the central point of the crescent-shaped shore. The latter was supported by a multitude of outworks along the shore. Marsa-el-Kanat fort, on the shore of the outer harbor, was unmanned. Along the sea-wall of the town were, besides the Ras-el-Tin fort, with twenty-four guns, Forts Aida and Castle Pharos on the other jutting arm of the peninsula, the latter overhanging the mouth of the eastern harbor. The western harbor is approached through three passes winding among spits and shoals, called the Corvette, the Bourgas, and the Marabout Passes.

constituting a reserve squadron ready to support either division. The strength of the eight ironclads which with the gunboats Bittern, Condor, Beacon, Decoy, and Cygnet, composed the attacking fleet, was as follows:

VESSEL.	Inches armor.	Guns.	Horse-power.	Tons.
Inflexible .....	16-24	4 81-ton.	8,000	11,406
Superb .....	10-12	16 18-ton.	7,480	8,760
Monarch .....	8-10	4 25-ton. 2 64-ton.	7,842	8,322
Sultan .....	6-9	8 18-ton. 4 12-ton.	8,629	9,286
Alexandra .....	8-12	2 25-ton. 10 18-ton.	9,492	8,615
Téméraire .....	8-11	4 25-ton. 4 18-ton.	7,700	8,540
Invincible .....	6-8	10 12-ton.	4,882	6,084
Penelope .....	5-6	10 12-ton.	4,702	4,894

The British force counted altogether 8,539 men and 102 guns. No two of the ironclads were of the same design. The three broadside ships, the Alexandra, Sultan, and Superb, composed the outer squadron, which was given the

task of silencing the forts along the sea-front, beginning with Ras-el-Tin and ending with Fort Pharos. The Alexandria is of the box-battery type with deeply recessed bows for the purpose of securing end-on fire. The Sultan is of the same type, but less heavily armed and plated. The Superb, originally built for the Turkish Government, is of the type of the Hercules. The Inflexible and Téméraire steamed along the

of men at once, dismount guns, and blow up magazines in the earthworks. Two of the broadside ships were at anchor from the first, and after a while all the ships of both squadrons anchored to secure more accurate firing. The gunboats remained in motion, and escaped almost without a shot.

The bombardment began at seven o'clock on the morning of the 11th of July. It lasted ten

Tonnage, 11,400; armor, 16 to 24 inches; men, 849; guns, four 81-ton, in two turrets.

line out of range of the forts, pouring their heavy shells into Fort Meks from Central Pass, and into Forts Aida and Pharos, which they succeeded in silencing. The Inflexible is one of the most powerful turret-ships afloat. The Téméraire is the only existing example of the barbette type, which is coming in favor with naval authorities. She ran aground in the beginning of the action, and was only released after several hours by the aid of two of the gunboats; but all the time her fire was particularly effective. The Invincible, the Monarch, and the Penelope constituted the inside squadron, attacking the forts at the western end of the bay from within the outer harbor. These are vessels of the old class. The Penelope, having the lightest draught of all, was able to work effectively at close range. The gunboats Condor and Cygnet could push up into closer quarters, and aided materially in the action.

The plan of Admiral Seymour was to engage the enemy all along the line, and harass him with an incessant bombardment. The ships moved at first in oblique lines, so that the Egyptian gunners were unable to get their exact distance, as they had to constantly vary the range. The forts, on the other hand, presented a fixed target, into which the eight ironclads poured a ceaseless hail of shells weighing some 258, some 410, some 547, and those of the 81-ton guns, 1,704 pounds. The firing was very inaccurate; but enough of it was effective to knock the stone forts into ruins, kill whole squads

and a half hours. Most of the forts attacked were silenced. The fire from some of them was heavy and sustained. The discipline and fortitude displayed by the Egyptian cannoniers were admirable. Their fire was extremely accurate as regards direction, but in elevation they generally failed. The round shot which hit the vessels did little damage, while none of the conical shells struck the ships.

The bombardment would have been continued longer if the commander had not landed a force to disable Fort Meks. It landed 900 strong and found the fort abandoned. Its two 10-inch guns were blown up and the rest spiked. The fortifications were destroyed by the shot, and the barracks and houses around shattered to pieces by the shells. Ras-el-Tin Fort was in the same condition, the adjacent palace greatly damaged and partly burned, and the light-house nearly destroyed. Fort Pharos was silenced, its magazine blown up, and guns dismounted. Fort Marabout was badly battered but not destroyed. A gallant incident of the battle was the dash of the gunboat Condor, commanded by Commander Lord Charles Beresford, close under the guns of this fort, which was harassing the ships considerably, to silence them. The buildings of the city suffered much. Several shells from the Inflexible burst directly over the town, and shells from all the deep-draught vessels, which were obliged to engage the forts at distances of 3,000 or 4,000 yards, occasionally fell in the town. The Alexandria was struck twenty-five times, and had

two guns disabled. The *Invincible* was pierced by six shots. The *Penelope* had a gun disabled. The casualties on the British side were only six killed and twenty-eight wounded. The loss of life on the Egyptian side was very great. It was only by killing all the gunners that most of the pieces on the earthworks were silenced.

The bombardment of Alexandria was an event of great technical importance, and of practical interest to the nations which have expended huge sums on monster ironclads. It proved that these floating fortresses are able to cope with shore-batteries, and will stand the fire longer. The conditions of the trial were, however, very favorable to the ships. The Egyptian gunnery was too defective to show the amount of damage which can be inflicted upon the ships. Their ammunition was not of the most suitable kind. The British ships, on the other hand, were favored with an exceptionally still sea, and their artillerists had complete charts of the bay, so that the elevations could be calculated at once, without the necessity of experimental cross-ranging. The engagement at Alexandria taught one important lesson regarding the defense against the heavy ordnance of modern ironclad frigates. It is, that earthworks afford an excellent protection. Shells from the 81-ton guns, exploding among sand-bags, inflicted no injury. They threw up great clouds of dust, and it seemed as though the whole structure was leveled; but when the air cleared the guns were seen to be in the same position. It was necessary to hit the guns themselves to silence these batteries. Masonry is useless against such guns; the strongest granite walls were shivered with a single shot. The next morning fire was opened upon Fort Aida and Castle Pharos. After a few shots a white flag was hoisted off Ras-el-Tin. Lieutenant Lambton proceeded in the *Bittern* to demand the surrender of Forts Ajami, Meks, and Marabout. He saw Toulba Pasha on board the Khedive's yacht *Mahroussa*, who stated his inability to conclude terms without consulting the Khedive and his ministers at Ramleh. When the time given for his answer had gone by, the British fired one shot, which was not returned. Another white flag was seen flying

that afternoon. The Egyptian troops during the day evacuated Alexandria, and retreated into the interior. Their silent withdrawal after opening negotiations was characterized by the English as an act of treachery.

LORD CHARLES BERESFORD, COMMANDER, R. N.

Most of the population had fled from Alexandria during the bombardment. When it was deserted by the troops, shocking scenes of pillage and destruction ensued. Some person in authority, probably Mahmoud Samy, gave the signal to plunder and fire the European quarter. The ragamuffins who abound in the Levantine cities reveled in the saturnalia of robbery and vengeance. Stragglers from the army set the example. Finely-built streets in the European quarter were burned to the ground. The richly-furnished shops were most of them gutted, and most of the merchandise was destroyed by the pillagers as soon as they reached the street. The conflagration lit the sky the night after Arabi's departure. Europeans who had remained in charge of the banks and offices barricaded the houses, and kept the mob off with their fire-arms. When the scenes of fury abated they dashed down to the shore in bands, and were taken on board the ships. Admiral Seymour telegraphed that the town had been given up to "Bedouins" to plunder, and in a second dispatch that it was "convicts," who had been set loose to loot the city. On the morning of the following day the English ventured to disembark and take possession of the deserted town. The admiral on the 13th landed parties of marines to stay the wild havoc. Lord Charles Beresford was given the direction of the police measures, assisted by Major Tulloch,

the chief of the landing party at Fort Meks. Commodore Nicholson, of the United States Navy, sent a detachment of marines, who stood guard at the American consulate, and assisted in maintaining order. The Russian, German, and Greek commanders followed the example, and landed small parties. The inhabitants soon flocked back to the city. Every Arab waved a white handkerchief as a signal of peace, or wore a red band in token of fidelity to the Khedive. When there was any evidence or appearance of their having joined in the looting, they were shot with little formality. The marines were particularly zealous in this hasty justice. By the 17th 5,800 soldiers and marines were ashore. The Tamar had arrived with nearly a thousand marines on board, and two regiments had been sent from Limasol, in Cyprus. The British Government were severely blamed, at home and abroad, for not having troops ready to land in time to save Alexandria from pillage and arson. Mr. Gladstone explained that they were precluded from landing an army by the protocol of sole action. The damage was taxed by the sufferers in their claims, presented before the commission of inquiry subsequently appointed by the Khedive, at a total of \$30,000,000.\*

The Khedive remained during the bombardment in the palace at Ramleh, with Dervish Pasha. A force of 300 men was sent with orders to murder the Khedive, but Arabi came and countermanded the order, leaving the soldiers as a guard. The English, as soon as they landed, sent a guard to Tefvik Pasha, who had come down to the Ras-el-Tin Palace. Mahmoud Baroudi, and all the ministers, except Arabi, presented themselves at the palace.

NEGOTIATIONS AT THE CONFERENCE.—In the diplomatic discussions between the joint protecting powers, England had the advantage of an untrammelled position, while France was fettered by difficulties on every side. England insisted upon intervention and the suppression of the national Government. This policy had been marked out by Gambetta, and the French Cabinet was in a situation where it could not reverse it, although Egyptian independence

\* The ancient capital of the Ptolemies remained down to the epoch of the Eastern Empire one of the largest and richest, and was also distinguished as one of the most turbulent cities in the world. After the Arab conquest it was eclipsed by the newly-founded Cairo, and steadily declined during the middle ages. It was entirely ruined by the Turkish conquest in 1517, and at the time of the French expedition in 1798 there was nothing but a cluster of Arab huts holding about 8,000 inhabitants. Mehemet Ali discerned the possibilities of the site, and revived its commercial greatness by clearing out the harbors and digging the Mahmoudieh Canal, which brings fresh water from the Rosetta branch of the Nile. Already prosperous as the sea-port for the overland commerce, the commercial capital of the Nile Delta underwent a prodigious expansion in wealth and magnificence when the American war brought on the cotton famine. The European quarter is in the eastern part of the city, near the sea. Around the Place Mehemet Ali, and in the streets leading out of it, were the consulates and other public buildings, huge blocks of offices, and magnificent emporiums. Sumptuous mansions lined the streets to the eastward in the direction of Ramleh. In this cool and delightful suburb on the sea-shore, four miles from the city, the English all resided, some of them in splendid villas.

found much sympathy in France, and would be more conducive to French interests than any form of intervention except an aggressive assertion of French preponderance, which would endanger the relations of the republic with Europe. England was shrewdly accommodating and yielding. She had been the first to propose a reference of the Egyptian difficulty to the powers. She expressed a willingness to agree to an intervention by the Porte, or to undertake a joint intervention with France. Any action must result in a stronger assertion of England's paramount interests and the sacrifice of the political preponderance of France, which had existed from the beginning of the century, and was strengthened by social influence and moral prestige far outweighing those of Great Britain. The intervention of Turkey as the mandatory of the powers was Freycinet's final proposition. England agreed to that, as she agreed to every positive proposition, although favoring most the interposition of the Sultan as sovereign lord. In order to safeguard French interests in Africa and make easier the acceptance of Turkish intervention in France, Freycinet imposed the condition that the expeditionary force should be commanded by French and English officers. After the bombardment the conference agreed upon the sending of a Turkish force to restore order in Egypt. They were to act under the direction of the Khedive, and to retire in three months, leaving all future arrangements to be decided upon by the powers. In this form the scheme was presented to the Porte in an identical note on July 15th. The Sultan could have no possible interest in lending himself as an instrument to enforce the will of England and France in Egypt. With nothing to gain, he would have sacrificed at one cast the fruits of his laborious efforts to restore the influence of the Caliph. Any hostile action against Arabi would have been as unpopular in Turkey as in Egypt. Arabi and his army were regarded as Moslem heroes. The softas and ulemas of Stamboul declared, with the pious doctors of Cairo, that Arabi would be bound by the Mohammedan law to disobey and resist the Caliph himself if restrained in his efforts to redeem the territory of Islam from the yoke of unbelievers. The Porte temporized as usual. It did not reject the principle of intervention, but objected to the conditions, which, between the jealousy of France and the ambitious designs of England, were so framed as to prevent the peaceful solution of the Egyptian difficulty by a simple demonstration of the authority of the Sultan, a solution which would have been as welcome to Egypt as to Europe. Great Britain was preparing as secretly as possible but with all possible speed for war at the time when she signed the identical note. Freycinet, although he had abandoned the aggressive policy of Gambetta, and was desirous of having the Egyptian question settled by the European concert, was prepared to co-operate

with England to the extent necessary to maintain France's position as joint protecting power. The deputies first granted the ministry a credit of 7,000,000 francs. On the 18th of July the announcement of the calling out of the reserves was made in the British Parliament. On the 24th the Prime Minister asked for a vote of credit, which he placed at the absurdly small sum of £2,300,000, to be raised by adding 1½d. to the income-tax. The dispatch of an Indian contingent had been announced on the 18th. The expenses of the Indian force it was proposed should be borne by the Indian Exchequer. On the same day that the military credit was voted by the British Commons the French minister applied for an additional vote. It was stated that French action would be confined to the protection of the Suez Canal, since the powers had refused to sanction an Anglo-French military intervention. The French Chamber, appealed to on the one hand by Gambetta, who vigorously attacked the Government for their tame attitude, and on the other by the ministry with a fine-drawn and scarcely intelligible scheme for keeping up the Anglo-French alliance without leaving the European concert, concluded that it was safer and more dignified to assume no share of the responsibility of breaking the concert and coercing the Egyptians. Freycinet resigned upon the rejection of the supplementary credit, and Duclerc formed a Cabinet with the policy of passivity and expectance. When Gambetta first initiated the plan of dual intervention, a counter-alliance of the Eastern powers—Russia, Austria, Germany, and Italy—was in the process of formation. Now that England proposed to take possession of Egypt alone, there was intense opposition in St. Petersburg, and there were murmurs at Rome and Vienna, but no combined action was possible. Russia had no objections to the annexation even of Egypt by Great Britain, but it should be at the price, as was proposed by the Emperor Nicholas, of the acquisition of the Bosphorus and Constantinople by Russia. Prince Bismarck held the key to the situation, through his influence over Austria and Italy. It was, perhaps, the frustration of this traditional scheme for Russian aggrandizement which now actuated him to turn a deaf ear to the frantic protests of his friend the Sultan.

The Khedive had ordered the cessation of war preparations, and had summoned Arabi before him in vain; but it was some time after the English obtained charge of the person of the Khedive before they could induce him to proclaim Arabi a rebel, and discharge him from the post of Minister of War. This was inevitable, since Arabi, in order to rouse the people to resistance, and carry out the rôle of defender of the sacred soil of Islam against the infidel usurpers, was obliged to denounce Tefvik as the slave of the Giaours, and assume the character of dictator. The Notables refused, however, to declare Tefvik a traitor. The

Khedive's proclamation appeared on the same day with one from Arabi Pasha, characterizing Tevfik as a traitor to his country and his religion. Furnished with this proclamation of the Khedive, the British ambassador to the Porte, Lord Dufferin, announced to the conference the dispatch of a British expedition to Egypt, explaining that the Alexandrian forts were destroyed as a measure of defense, and that the expedition was necessitated by *force majeure*, and was not to be construed as "isolated action" or a breach of the protocol *de désintéressement*, but was solely intended to restore peace and order, to secure the free navigation of the Suez Canal, and to re-establish the authority of the Khedive. The Porte was the only Cabinet which was deeply interested in keeping the English out of Egypt. The proposition of the conference, that the Sultan should forcibly suppress the movement which he had encouraged, and take up arms against the defenders of Dar-ul-Islam, a Moslem land, as the mandatory of the powers, was an impossible course. He sought to delay the proceedings as long as possible, and looked in vain for a friendly combination in Europe to prevent the British occupation of Egypt. The Russian ambassador, M. Onou, was instructed by his government not to attend the conference, which England by her isolated action had set at naught; but in a few days he returned to the meetings. The Porte replied to the invitation to subdue the Egyptian rebellion with Turkish forces by declaring a willingness to enter the conference. Said and Assam Pashas appeared at the conference on July 26th. They announced that the Sultan did not reject the principle of a military occupation, but that the conditions contained in the identical note would have to be reconsidered. The announcement of the British expedition was now met with a declaration that the Sultan would send troops to Alexandria, in accordance with the terms of the identical note. The Conference, after accord was re-established, only sat as a matter of form, remaining passive and neutral in the discussion which ensued between Turkey and England. Great Britain pretended to accept Turkish co-operation, but demanded as a preliminary that the Sultan should proclaim Arabi a rebel. The ulemas of Stamboul, as well as of the Azhar Mosque at Cairo, protested that Arabi could not be regarded as a rebel when protecting a Mussulman country against the aggression of a Christian power. The highest authorities in Mohammedan law, the professors at Cairo, declared that it would cost the Sultan his caliphate if he took part with the infidels. The Sultan sent a force of 3,000 men to Suda Bay, ready to land in Egypt at a moment's notice. A military convention was submitted to the Porte by Earl Dufferin. The English desired the proclamation declaring the Egyptian army to be rebels, and would have liked to have a Turkish force posted in Egypt for the moral effect, but insisted on having it placed under

their control. The conditions of the military convention were as follow:

1. That the Turkish contingent should be restricted to 5,000 men.
2. That it should land at Aboukir, Damietta, or Rosetta.
3. That its movements and operations should be regulated by a previous agreement between the English and Turkish commanders.
4. That a Turkish military commissioner should be attached to the English headquarters and an English commissioner to the Turkish headquarters; and,
5. That the English and Turkish troops should evacuate Egypt simultaneously.

Said Pasha proposed modifications which would place Turkey in an independent and co-ordinate position. Lord Dufferin refused to submit the question to the conference. He resorted to Turkish evasion and procrastination to prevent a settlement, while the military operations were being pushed forward. At last, when the English had seized Port Said and were ready to strike the decisive blow, he obtained the desired proclamation from the Sultan in return for permission to send a Turkish force to Port Said. He then quibbled about the form of the proclamation, and, after accepting that, about the terms of the convention, which were, he said, that the Turkish troops might "proceed to" Port Said, not that they might "land" there, until Arabi's force was crushed. The British ambassador then announced that a military convention was no longer necessary, and broke off the negotiations.

**BRITISH INTERESTS IN EGYPT.**—The British interests in the Suez Canal as the route of military communication with India and Australia were advanced as the all-sufficient ground for the Egyptian expedition. The neutrality of the canal is guaranteed by Europe. Its safety was not at all imperiled by the political changes in Egypt, whatever might have been their outcome. Except as being nominally within the dominions of the Khedive, as being touched by a railroad from Cairo at two points, and as deriving its supplies of fresh water from the interior, it was entirely outside of the influence of events in Egypt. The main object of the war with the British Government was doubtlessly to alter the *status quo* of the canal by a definite assertion of the paramount interests of England before Europe, and the assumption of a priority and predominance in Egypt which will prevent any hostile power from ever using its government to politically harass England or belligerently menacing the connection with India from Egyptian soil. Another political reason given was to maintain Tevfik Pasha on the throne on which England and France had placed him. There were various important pecuniary and commercial interests which, though seen to have been operative in the train of events through which Great Britain "drifted into the war," were not acknowledged as motives, except two or three of them in a secondary degree. The interest of the British Government in the solvency and good faith of Egypt was involved to the extent of the 5 per

cent annual interest on the Khedive's 176,602 shares, two fifths of the original capital transferred to the British Government for the £4,000,000 in cash, which interest, amounting to £198,829 a year, is paid in lieu of the profits up to 1894, to which date the dividends were already alienated by the Khedive to the Suez Canal Company.

Of the mercantile interests threatened or said to be threatened by the Egyptian imbroglio, the most important and the most deserving of being defended were those of British commerce in the Suez Canal. Of the 17,207 ships with an aggregate tonnage of 33,244,452 tons which passed the canal from the time it was opened in December, 1869, till the end of 1881, 12,960, with a total capacity of 25,779,664 tons, were British. The French came next in the amount of tonnage, but it was only about one twelfth as much as the British. The aggregate amount of tolls collected in that period was about \$64,370,000, averaging \$1.90 a ton and \$3,660 a ship, the average tonnage of the ships passing through being 1,932 tons. In the year ending in April, 1882, of the 3,006 vessels, aggregating 4,257,000 tons, which passed through the canal, 2,484, of 3,512,000 tons, were British. About one fourth of the total capital invested in British shipping is engaged in the Suez Canal traffic.

**THE CAMPAIGN.**—The preparations for the war of occupation were entirely secret up to the time of the bombardment of Alexandria. Then the British forces in the Mediterranean

General Sir Archibald Alison, was collected gradually from the Mediterranean stations, which held Alexandria while the first reserves of the English army were being mobilized. The army reform in England is not yet complete, and although discipline and *morale* have deteriorated through the short-service system, mobilization is still sluggish. While a thoroughly appointed corps was getting ready in England and a body of Indian troops was being equipped to meet it in Egypt, the garrison at Alexandria made frequent reconnaissances, but did not venture to engage Arabi, although they were strong enough to meet the force which he then had. A sharp skirmish occurred on the 5th of August. The Egyptians intrenched themselves at Kafr-Dowar and strengthened the fortifications at Aboukir. New recruits flocked to Arabi's camp by thousands. Before the arrival of the English expedition he organized a military government which covered the whole country, had every point guarded, and animated the mild population of the Delta with the spirit of war. It was over a month after the bombardment before the English army arrived at Alexandria.

Arabi erected strong fortifications at Kafr-Dowar, a triple line of formidable earthworks. With the railroads of the Delta at his command he was able to concentrate at any point. All along the line from Meks to Tel-el-Kebir his garrisons confronted the invaders from behind powerful intrenchments. He had altogether about 70,000 men, with one hundred and fifty cannon. They were aided by the Bedouins, who might have proved formidable irregulars, and did harass the English wherever they had an opportunity. The Egyptian army was armed with Remington rifles and Krupp guns of all calibers. They had an abundance of ammunition, their commissariat was amply supplied, their transport was unexceptionable. The bulk of the forces were at first at Kafr-Dowar; and then, when the British established themselves on the Suez Canal, they were massed at Tel-el-Kebir. There were besides 3,000 men at Meks, 11,000 in the forts of Aboukir, 8,000 under Abdelal in Damietta and the neighboring forts, and a garrison of 11,000 at Cairo.

The expeditionary force sent from England consisted of 1,010 officers and 21,200 men, with 54 field-guns, 5,600 horses, and 500 pack-animals. The English authorities had sent orders to America and other countries to have mules ready to send on, but were precluded from buying them before Parliament granted supplies for the war. Their transport service was therefore crippled throughout the campaign. Re-enforcements were sent on afterward of 10,800 men and 280 officers. The Indian auxiliaries numbered 170 officers and 7,100 men. The British commander-in-chief, Sir Garnet Wolseley, arrived at Alexandria on August 15th. He ordered the troops who had landed to re-embark, and on the 19th the whole force

MAJOR-GENERAL SIR ARCHIBALD ALISON.

[He commanded a division. He was born in 1826, and served in the Crimea and in India, losing an arm at the relief of Lucknow. He was chief of the intelligence department at the War Office when he left for Egypt.]

began to move forward, and preparations went on more actively and openly in England and India. A force of about 6,000 men, under

sailed away in five ironclads and sixteen transport-ships.

General Wolseley gave out that he meant to force the enemy's stronghold at Aboukir, and from there assail his right at Kafr-Dowar. It would greatly simplify the difficulties of the campaign if the British should occupy a point on the Suez Canal, and advance from there upon Cairo. But they were supposed to be bound to respect the neutrality of the canal. They were especially bound, since they had given solemn assurances to De Lesseps that they would not extend their operations to the canal, and on the strength of these promises Arabi had been prevailed upon to spare the canal, when he would otherwise have closed

ter by damming the Mahmoudieh Canal. The lowering of the water in the canal forced Sir Garnet to try the mettle of the enemy, although he had not sufficient force to take the field yet. On the 24th of August he advanced to Ramses with the Household Cavalry, a detachment of mounted infantry, two field-guns and two Gatlings, and one thousand infantry, all under the immediate command of General Willis. The Household Cavalry, by a dashing charge, gained possession of the dam between Magfar and Mahuta. The position of the small force became critical when re-enforcements, pouring in from Tel-el-Kebir, increased the Egyptian army to about ten thousand men, with twelve guns. Sir Garnet, as he reported boastfully in his

the passage to prevent the British from making it their base. Accordingly, when the fleet left Alexandria and steamed into Aboukir Bay, neither the Egyptians nor any one else suspected any deception until, after this feint upon Fort Aboukir, Port Said and Ismailia were occupied, and the whole canal was in the hands of the British. The English troops and Sir Herbert McPherson's Indian contingent united at Ismailia.

The Egyptians cut off the supply of fresh wa-

ter by damming the Mahmoudieh Canal. The lowering of the water in the canal forced Sir Garnet to try the mettle of the enemy, although he had not sufficient force to take the field yet. On the 24th of August he advanced to Ramses with the Household Cavalry, a detachment of mounted infantry, two field-guns and two Gatlings, and one thousand infantry, all under the immediate command of General Willis. The Household Cavalry, by a dashing charge, gained possession of the dam between Magfar and Mahuta. The position of the small force became critical when re-enforcements, pouring in from Tel-el-Kebir, increased the Egyptian army to about ten thousand men, with twelve guns. Sir Garnet, as he reported boastfully in his

who had flanked them by a wide *détour*, attacked the retreating troops and captured five Krupp guns, seventy railroad-cars, with large quantities of war material, taking Mahsameh Railroad Station, and cutting off their line of communications.

The English had landed in Egypt twenty-four thousand troops altogether, including the Indian force which debarked at Ismailia. One

LIEUTENANT-GENERAL WILLIS.

[He commanded the First Division. He was born in 1832, and served during a part of the Crimean war.]

brigade was left at Alexandria, while the others joined the Indian contingent on the canal. Sir Garnet Wolseley's situation in the desert before Tel-el-Kebir was gloomy. He was not able to advance upon the objective point for lack of transport facilities. Kassassin was seized on the 25th of August and held by General Graham, but the transports were twenty miles behind. The blazing sun, the foul and tepid water of the fresh-water canal, and the malarial vapors caused prostration, dysentery, and fever. In a week four hundred men were sent home invalided. The horses of the Indian auxiliaries were disabled with glanders. While the army was waiting and suffering, mules were being purchased in the United States. Mules which were on the way to the seat of operations were stopped by an embargo of the Sultan of Turkey.

The deluded Arabi, thoroughly alarmed at the change in the situation which brought an overwhelming British army close to Zagazig, the key of the Delta railway system, and within striking distance of Cairo, determined to strike quickly, as delay would only lessen his chances. He took command of the Tel-el-Kebir force in person, and massed his troops there as rapidly as possible. On the 28th of August he made an attack upon General Graham, who, with a mixed body of about two

thousand men, had advanced to occupy the Kassassin lock on the fresh-water canal. The Egyptians brought up their forces under cover of an artillery-fire, and in the afternoon advanced, under the immediate command of Arabi Pasha, with the intention of turning Graham's right flank. The English had, fortunately for them, thrown up field-works. They posted their artillery in a position to command the whole front of the line, and kept up such a steady fire that the Egyptians wavered after marching up very bravely, and refused to make the final dash. The English general seized the favorable opportunity and ordered a general advance. The horse-artillery took a position at close range. General Drury Lowe's dragoons, when the enemy were retreating in good order, rushed upon the Egyptian artillery and seized the guns, which they were unable to bring away, and then sabbared their way through and through the infantry, turning the retreat into a complete rout.

Sir Garnet Wolseley had the forces on the spot to cope with the Egyptian army, but felt obliged to delay his advance while Arabi was strengthening his defenses, and his own troops and horses were suffering from the torrid climate, because the departments were defective. While, during the next two weeks, he was organizing a commissariat and transport service, and collecting railway material, preparatory to commencing operations in the interior, Arabi made one more attempt to force the advanced position of the British at Kassassin, and crush

MAJOR-GENERAL G. GRAHAM.

[He commanded the Second Brigade. He served with distinction in the Crimea, and received several wounds in that war and in the Chinese war. He entered the army in 1850, and attained the rank of Major-General in 1880.]

General Graham's command before the movement on Tel-el-Kebir, which he knew would not be put off much longer. At dawn on the

9th of September he led up a force consisting of eighteen battalions of his choicest infantry, a considerable body of cavalry, and thirty guns. He occupied a rising ground commanding the British right, but his guns were badly served, and were silenced by the accurate aim of the English cannoners. The cavalry were checked and rendered useless by the British cavalry. The infantry advanced boldly and steadily to within eight hundred yards of the English line, when a flank movement of Drury Lowe's cavalry division caused them to hesitate, and the destructive infantry-fire of the English brought them to a stop.

On the night of the 12th, the British camp broke up and the baggage was removed to the railway. A force of about 14,000 of all arms left Kassassin and marched in the dark and in silence toward Tel-el-Kebir. The horse-artillery and cavalry kept well to the right, so that they might in the engagement sweep around the left flank of the enemy and gain his rear in order to cut off retreat. The army halted before dawn within a thousand yards of the fortifications without having encountered a single vedette. The battle-line was formed in a semi-circle, threatening the front and both flanks of the enemy. They then marched upon the intrenchments. The Highland brigade on the left was ordered to carry the first line of intrenchments with the bayonet before firing. When eight hundred yards away they received a volley of musketry, the first sign of life within the fortifications, upon which they rushed forward, cleared the wall, and bayoneted the Egyptians. They encountered a severer fire from the next line of intrenchments, which they returned for a couple of minutes, and then ran forward and carried the works. From between the redoubts they poured a flanking fire into the enemy which withered their ranks and paralyzed their action. The intrenchments on the right were forced with more difficulty by the Irish regiments of Graham's brigade. The outer work was in like manner won with the bayonet. The Egyptians stood their ground and fought well for a time, but at the repeated onsets of relays of fresh troops threw down their arms and fled in confusion. The artillery broke up the fleeing ranks, and the cavalry followed them up and completed their disorder. The British soldiery were merciless in their use of the victory, slaughtering the wounded in the trenches and the unarmed fugitives with frightful barbarity.

The defeat of the Egyptians was very complete. The army was scattered, thousands were killed and about 3,000 made prisoners. The guns and camp equipments and vast stores of forage and provisions fell into the hands of the English. The English general acted promptly so as not to give Arabi any time to re-collect his forces. In a few hours Zagazig, where large quantities of locomotives and rolling stock were found, was occupied by Macpherson, and Belbeis by Lowe, and on the 15th

both generals entered Cairo. Here Arabi and several of his principal officers and associates were made prisoners.

After Arabi's formidable power was thus crushed at a single blow, many voices in England called upon the Government to secure the fruits of victory notwithstanding ministerial pledges and protestations of "clean hands." If there were powers who would not begrudge some modification of the *status quo ante* by the right of conquest, Russia, who had been held by Great Britain under threats of war to the strictest interpretation of the Treaty of Paris, was not one. M. de Giers promptly reminded the English Cabinet of the terms of Lord Salisbury's circular, and wrote: "The *status quo*, territorial and political, must be maintained in Egypt as it has been established by treaties; and if, as a result of the late events, changes are recognized as necessary, Europe alone is competent to decree and enforce them. The conference has never been contested by the English Government." The position of the Control was according to the promises of England stronger than ever, since the war had been undertaken to establish the rights which it claimed over the Government of Egypt. France protested when the British Government proposed to abolish the Control and rejected the substitute proffered of a debt commission. The Controllers sat in the councils of the ministers at first the same as before. After a while the English Controller absented himself, and was at last recalled. The Control was thus practically abolished. The actual administration fell again into the hands of the old official class, the Turks and Circassians, and exhibited the old vices of bribery and extortion, which were remedied under the Control.

The reorganization of the military establishment of Egypt was claimed as the right of the victors, and it was understood that the English should settle upon a scheme for a gendarmerie to suit themselves, and which they could keep under their influence. Baker Pasha, a British officer, who was serving the Sultan as chief of the engineer department, was summoned to organize the new army. Although the Sultan refused to give him his discharge, he came and matured schemes for the replacement of the national army with foreign mercenaries.

The Khedive called to himself a ministry, of which Sherif Pasha was chief. He took the portfolio of Minister for Foreign Affairs; Riaz Pasha that of Minister of the Interior; Omar Pasha Lufti became Minister of War and Marine; Ali-Mubarek Pasha, Minister of Public Works; Haidar Pasha, Minister of Finance; Khairy Pasha, Minister of Public Instruction; Fakhri Pasha, Minister of Justice; Zeki Pasha, Minister of Wakfs; Ismail Eyoub Pasha, Minister for the Soodan. The first act of the Government, on the advice of the Controllers, was to create an international commission to adjudicate upon the claims of foreigners for compensation on account of losses sustained

from the insurrection. The claims were appraised at \$10,000,000 for property plundered and destroyed at Alexandria, \$7,500,000 for buildings burned in the city, and \$5,000,000 for losses in other localities.

Arabi Pasha and the other members of the provisional government were brought to trial before a military tribunal. Arabi was allowed English counsel and the English authorities interested themselves to save him from death, which is usually the fate of the leaders of unsuccessful political movements within the Turkish Empire, after it was proved that he had no complicity in the June riots nor in the sacking of Alexandria. Moreover, it would have been inconvenient to the British Government to publish the correspondence which was discovered, showing the connection of the Sultan with the Egyptian revolution. Arabi, on the advice of his counsel, pleaded guilty to the charge of "rebellion." Sentence of death was pronounced against him and his colleagues, which, according to a previous understanding, was commuted by the Khedive to perpetual banishment. The British colony of Ceylon was designated as the place of exile, whither Arabi, Mahmoud Sahmi, and Toulba were conveyed and maintained in safe retirement.

**THE FALSE PROPHET.**—While the Egyptian revolution was being suppressed with British arms, another revolution was enacted in the remote provinces of the Soodan. The inhabitants of these provinces have suffered greatly under Egyptian rule from the oppressive taxes of the Government, and still more from the corrupt officials and farmers of the taxes. They are negroes, with an occasional mingling of Arab blood. These dark races are fanatical Mohammedans. They make brave and hardy soldiers, and have furnished the only good material for the Egyptian army. A man named Mohammed Achmet, a boat-builder by trade, born in the region of Dongola, on the western bank of the Nile, proclaimed himself the expected Mehdi, or successor to the Great Prophet and deliverer of the people. He soon obtained a large following among these superstitious people who had felt oppression. A small force of soldiers attempted to dislodge him from the island of Abbas, 200 miles south of Khartoom, but were slain to the last man before they fired a shot. The pretended prophet withdrew after this exploit to a safe position in a wild mountain about ninety miles northwest of the penal colony and military station of Fashoda. The Baggara Arabs, the former slave-hunters of the White Nile, joined his standard in great numbers. A new Governor of Fashoda attempted to distinguish himself by leading an expedition against the rebels. He and all but 70 of his 800 soldiers were killed. In June Giegler Pasha, who succeeded Raouf Pasha as governor-general, sent the largest force that he could muster, 3,500 Egyptian regulars, against the Mehdi. They met him at the head of 7,000 men near Kordofan.

Although the rebels were mostly armed with spears, the Egyptian troops could not stand their onset. They threw down their arms and fled, the greater part of the force was destroyed, and the victorious Mohammed Achmet marched upon Sennaar. For several months he was sole master of the Soodan. After the British conquest an expedition was organized and sent to the White Nile to put down the pretended Messiah. The strong places on the eastern side of the river were recovered. The Mehdi suffered a severe repulse with losses reported to be over 15,000, when attempting to besiege Obeyad, the capital of Kordofan. He then laid siege to the town, but afterward withdrew to Birkeh, where, in December, he was reorganizing his troops and awaiting re-enforcements from Bahr-el-Gazal and Darfour.

**EGYPTOLOGICAL AND ASSYRIOLOGICAL RESEARCH.** Our knowledge of remote antiquity and of the primitive condition of the historical nations has been vastly enlarged, and is still being enriched at a rapid rate, by the examination of the ruins of the ancient cities and monuments of Egypt and the Mesopotamian empires—resources which were wholly unknown to our ancestors, and the value of which had hardly begun to receive adequate appreciation a generation ago. These investigations have received a powerful impulse within the last two or three years by the publication of discoveries of great importance which have been made in Egypt, Assyria, Babylonia, and Syria, and are now prosecuted with more vigor and intelligence than ever before. The work was hardly interrupted by the war in Egypt, which, coming in the idle season, when active out-of-door operations were not practicable, caused at most a temporary apprehension that the stores of relics and records accumulated at Boolak might be in danger of pillage by the insurgents. Happily, these fears were not justified; and since the war was closed, the museum at Boolak has been renovated, enlarged, and rearranged, and now has double the capacity it had before, and a vastly increased value. Work in the cabinet has in the mean time gone on without intermission; and excavations have been begun again, on a liberal and systematic scale, from which further discoveries of value may be anticipated. Before describing the results of the latest investigations in the fields of prehistoric research, it will be proper to review the conclusions which had already been reached respecting the periods and conditions of the most ancient empires.

**EGYPTIAN CHRONOLOGY.**—The results of the investigations in Egyptian antiquities are such as to establish, according to the most moderate calculation, the existence of the Egyptian monarchy 1,500 years at the least, but probably more than 2,000 years before the birth of Moses, which is placed at 1,571 years before the Christian era. But 1,500 years before Moses, who was 1,571 years before Christ, who was 1,882

years before the present time, takes us back 4,952 years, or about 5,000 years ago.

The materials for these investigations consist of the inscriptions on monuments, in temples and tombs, and the writings on papyrus. The immense collection of these inscriptions or texts which has been made is only a fragment of those which exist. To copy those alone in the temple of Denderah, of which every square foot of the walls is covered with pictures or texts, would be the work of years. The inscriptions of a single tomb are often as comparatively abundant as those at Denderah. Nevertheless, the work of destruction has been going on for ages. Abd-el-Latif, a learned Arabian writer of the middle ages, tells, in his description of Egypt, that the ruins of Memphis in his time extended half a day's journey in every direction. But of Memphis there is at present hardly a trace left. And other great cities known to ancient travelers have disappeared with their monuments. Mummy-cases and coffins, with most interesting inscriptions, have for centuries been used for fuel, and innumerable manuscripts have suffered the same fate.

**NATURE OF THE MATERIALS.**—Most of the documents, according to the views of M. Renouf,\* here presented very fully, which have come down to us, are of a religious character. The principal reason of which is, that all the ancient monuments of Egypt have perished except some which were necessarily of a religious nature—the temples and the tombs. The palaces of kings and nobles have utterly disappeared.

It should be stated that the system of reckoning periods of the Egyptians was not by centuries, or eras and dates, but by reigns and dynasties; thus the Exodus described in the Pentateuch took place in the fourth reign of the nineteenth dynasty, which was about fifteen hundred years before the Christian era; and in going back from the Roman conquest of Egypt to the first years of the seventh century before the Christian era, which is the advent of the twenty-sixth dynasty, the chronology is exact. But the principal defects in estimating the periods are various. The duration of a reign, or of a dynasty, is sometimes very far from being known; they may also have been local or simultaneous, and until all these points are cleared up a complete Egyptian chronology is impossible.

But the nature of the undisputed evidence upon which relative dates are assigned to the various periods of Egyptian civilization, and which imperatively demand that a very early date indeed should be assigned to the origin of that civilization, should be stated. There is not a single monument known which in its bearings upon chronology is liable to the charge of numerical exaggeration. They never speak of

contemporary events. Dates are given by the year of the reigning king. This is never so high as to justify a doubt. The manifest defect of such inscriptions for chronological purposes is, that the last monumental year, which happens to be preserved to us, of a king, is not necessarily the last of his reign. An error of several years is possible in each reign when there is no direct evidence to the contrary. But the error is not on the side of exaggerated numbers. Still more important than the monuments which mention the year of a king, are those in which two or more sovereigns of the same period are mentioned, especially if their succession or other precise data are given. Such is the treaty made in the twenty-first year of his reign between Rameses II and the King of the Cheta, wherein Rameses II calls himself the son of Seti I, who in turn is called the son of Rameses I. There is a very large number of inscriptions belonging to personages who have been born in one reign and died in another, or who have served several kings in succession. And the inscriptions of the same period naturally confirm one another, or supply details which are missing.

**SERIES OF INSCRIPTIONS.**—The most remarkable series of inscriptions which have been utilized for chronological purposes consists of those relating to the Apis bulls, the wonderful tombs of which were discovered by M. Mariette. One of these sacred animals was born in the twenty-eighth year of King Sheshonk III, lived twenty years, and died in the second year of Pamaï. Another Apis was born in the twenty-sixth year of Taharqa, and died in the twentieth year of Psammitechus I. A hundred and sixty-eight tablets in honor of this one Apis have been found, of which fifty-three are dated. Many other like instances could be mentioned. Documents of this kind bring us down past the time of Cambyse, and even into the Ptolemaic period; that is, into a period of well-ascertained chronology. By means of these inscriptions alone it is possible to go back from Cambyse to the first year of Taharqa, about seven hundred years before Christ, the limit of possible error being two or three years at the utmost. With Taharqa—the Tirhaka of Scripture, who was the last king of the twenty-fifth dynasty—begins the latest period of the history of the Pharaohs.

The first kind of monuments herein described is useful, as furnishing the highest attainable monumental year of a reign; the second kind enables us, besides, to determine the order of succession of reigns. Both these kinds of monuments are contemporaneous with the persons and events mentioned upon them. But besides these there are monuments giving long lists of sovereigns, all of whom can not have been contemporaneous. Such are the famous tablets of Abydos, that of Saqâra, the chamber of Karnak, and some others. In the chamber of Karnak, Thothmes III is represented as making an offering to sixty-one of

\* "The Origin and Growth of Religion, as illustrated by the Religion of Ancient Egypt." By P. Le Page Renouf. (Hibbert Lectures for 1879.)

his royal predecessors, whose names are given. At Abydos, Seti I, together with his son Rameses, then heir-apparent, offers incense to no less than seventy-six kings. It will be remembered that the Israelites in bondage are said to have been employed in building the treasure cities, as the Hebrew *meschenoth* is commonly translated, or rather sanctuaries, of Pithom and Rameses. It may be considered\* absolutely certain that no place in Egypt ever had the name of Rameses till the appearance of the celebrated hero of that name, who is actually represented on this monument as the son and heir-apparent of Seti I; neither will any instance or occurrence of the name ever be found, it is believed, more ancient than that of Rameses I, the grandfather of the great conqueror. Now, if this tablet of Abydos is correct, seventy-six kings—that is, very many more kings than can be counted in English history—must have reigned over Egypt before the first books of the Bible were written. But if we go back in English history to Ethelred II, in 976, we shall find that not more than forty-four sovereigns have reigned during a thousand years, and the average length of an Egyptian king's reign can not be shown to be shorter than that of an English sovereign.

TABLET OF ABYDOS.—But are the names on the tablet of Abydos those of real personages or of imaginary ones? There is but one way of settling this question, and that is by looking out for evidence which will confirm or contradict these royal lists. As far as the test of verification has been applied to these lists, there is no reason whatever for distrusting them. Instead of admitting the names of sovereigns who have never lived, they have, for certain reasons, omitted the names of many the existence of whom is quite certain. The intention of the tablets was not historical or chronological, but simply devotional, and the selection and arrangement of names consequently vary, though the most considerable names are the same in all. M. de Rouge has carefully studied all the monuments which belong to the first six dynasties.† The earliest monuments that can be found belong to King Senefru, the twentieth on the list of Abydos; and from this king till the thirty-eighth on the list the evidence is complete, and the order of succession thoroughly established by independent inscriptions contemporaneous with the sovereigns of whom they speak. The same truth may be asserted of the twelfth dynasty, which in the tablet of Abydos is represented by numbers 59 to 65. The number of monuments accurately dated belonging to this period is very considerable. They are all perfectly consistent with one another, and leave no doubt as to the length of each reign, and of the whole dynasty.

But it is important to notice the omissions of this tablet. The most beautiful monuments

of the eighteenth dynasty were constructed by the powerful queen Hatasu, sometimes called Hashop, daughter of Thothmes I, who associated her with him. She reigned for some years, either alone or in conjunction with her brothers, Thothmes II and III, successively; but her name and memory were persecuted by the latter, who resented her dominion over him during his minority. Her name does not appear in the tablet of Abydos. There is also an interval between the reigns of Amenhotep III and Hor-em-heb, which chronologically is filled up by the period of the sun-disk worshippers. The former was followed by a king, the fourth of the same name, who dropped it when he assumed that of Chut-en-Aten, as the founder of a new religion, which had a short-lived success. His attempts at reformation led to his exclusion from the lists of the legitimate kings. There is monumental evidence of one or two reigns of short duration before that of Hor-em-heb. The omission of the heretical sovereigns is easily accounted for. But no satisfactory explanation has yet been given of the omission of a large number of names between the end of the twelfth and the beginning of the eighteenth dynasty. The immediate passage on the tablet from one of these dynasties to the other can not mean that the king numbered 65 was followed by the king numbered 66, who is Aahmes I. King Sekenen-Ra was his predecessor, and there were even three kings of that name, and their tombs have been found at Thebes. The tablet of Ameniseub, in the Louvre, belongs to the reign of a king anterior to the eighteenth dynasty, but later than the twelfth. The interval between these dynasties must have been very considerable. The time immediately preceding the eighteenth dynasty was the period of the foreign domination, generally known as that of the Hyksos, or Shepherd Kings. But it is impossible to ascertain from Egyptian records when this period began, and how long it lasted. The 511 years ascribed to it by Manetho, as quoted by Josephus, must remain subject to future verification. The only evidence from Egyptian sources is a monument of Rameses II, dated from the four hundredth year of one of these kings of foreign origin. But a considerable number of native kings must have reigned between the last king of the twelfth dynasty and the beginning of the foreign invasion. Perhaps the most interesting monument of this period is the colossal statue of the king Semench-ka-Ra (the eighteenth king of the thirteenth dynasty, according to the royal Turin papyrus), on the right shoulder of which one of the foreign kings has had his name engraved in hieroglyphic characters. Of the kings of the eleventh dynasty only two, numbers 57 and 58, appear on the tablet of Abydos. Very interesting inscriptions belonging to their reigns are still extant, but other kings of the same names are known not only by inscriptions, but by their coffins. Of one of them,

\* Le Page Renouf on the religion of ancient Egypt.

† "Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manethon," Paris, 1866.

Mentuhotep III, dates have been found as high as his forty-third year. Evidence like this proves that there is no exaggeration in the list of Abydos, which does not aim to present a complete list of kings, but only mentions those for whom Seti I had a special devotion. The disappearance of Memphis and other great cities is sufficient to account for the absence of monumental evidence for some of the reigns. But a want of space will not permit us to consider further the nature of the evidence.

**SPLENDOR OF THE ORIGINAL MONUMENTS.**—No correct ideas can be formed at the present time of the original splendor of the great pyramids. "The smooth casing of part of the top of the second pyramid," says Dean Stanley, "and the magnificent granite blocks which form the lower stages of the third, serve to show what they must have been all from top to bottom; the first and second, brilliant white or yellow limestone, smooth from top to bot-

tom, instead of those rude, disjointed masses which their stripped sides now present; the third all glowing with the red granite from the first cataract. As it is, they have the barbarous look of Stonehenge; but then they must have shone with the polish of an age already rich with civilization, and that the more remarkable, when it is remembered that these granite blocks which furnish the outside of the third, and inside of the first, must have come all the way from the first cataract. It also seems, from Herodotus and others, that these smooth outsides were covered with sculptures."\*

DECAY OF FIVE THOUSAND YEARS ON THE GREAT PYRAMID.

tom, instead of those rude, disjointed masses which their stripped sides now present; the third all glowing with the red granite from the first cataract. As it is, they have the barbarous look of Stonehenge; but then they must have shone with the polish of an age already rich with civilization, and that the more remarkable, when it is remembered that these granite blocks which furnish the outside of the third, and inside of the first, must have come all the way from the first cataract. It also seems, from Herodotus and others, that these smooth outsides were covered with sculptures."\*

**WHAT IS THE AMOUNT OF THE TESTIMONY?**—The aggregate testimony of the Egyptian monuments, interpreted by M. de Rouge in 1865, warrants the following summary of all we

The eighteenth dynasty is rich in monuments of every kind—historical and religious, literary and artistic. The same is true of the succeeding dynasty down to the time in which Moses probably lived. That period comprises the golden age of the later architecture and of Egyptian literature. A little poem, almost contemporary with the birth of the prophet, and of which there are three copies, can be put by the side of one of the most beautiful chants of the *Iliad*; even then a series of magnificent specimens of religious lyric poetry had commenced. The period of the domination of the Hyksos, during which the national kings were banished to the south, in a humble situation, retains, in the documents of Egypt, scarcely anything that is edifying, and even the thirteenth dynasty can be only most imperfectly restored. But, on going back to the twelfth\* dynasty, such an abundance of contemporary texts are found that the history and duration of the dynasty, which was a little more than two hundred years, can be reconstructed with very great precision. Then comes another period that is very obscure, most probably one of division and anarchy, or of foreign invasion, the duration of which is unknown. But beyond this is the series of the sixth, fifth, and fourth dynasties, of which the inscriptions and religious paintings and funerals manifest the constitution of the administration of affairs, and almost the etiquette of the court, also details of the funeral rites and of domestic life,

\* "Sinai and Palestine," p. 57.

\* Which made the Lake Moeris and the Labyrinth.

to the time when the chronological reckoning is lost. Beyond, scarcely anything is known more than that the third as well as the fourth dynasty had its seat at Memphis, and the first two their seats at This; perhaps the kingdom of Thinites was contemporary with the former dynasties.

Thus, before Moses, were three very long periods, separated from one another by undetermined intervals, each of which abounds in texts of every kind preserved in the original. There is also a great work on Egyptian theology of more than a hundred and sixty chapters, of which a part exists in manuscripts anterior to Moses, some portions of which are engraved on one or more sepulchres anterior even to the twelfth dynasty. Concerning the value of the conclusions drawn from the hieroglyphic writings, it is proper to say that though they often present subtleties hard to comprehend, and grammatical difficulties, the principles on which they are used and their general meaning have been carefully and intelligently studied out, and no room has been left for any serious mistake in the matter. Great aid has been rendered in the study and translation of the Coptic, the liturgical language of the native Christians, which it has been found is hardly more different from Pharaonic Egyptian than Italian from Latin.

Numerous monuments exist in the region of the Euphrates and the Tigris, the country of the Abrahamic ancestors of Israel, with inscriptions in the cuneiform characters, and texts preserved on cylinders of clay, which, besides being of the greatest historical value, give important information concerning political conditions and the religious beliefs and rites of many centuries anterior to Moses.

These texts present a doctrine remarkably different from the later Babylonian religion with which that of the Assyrians, or Ninevites, was nearly identical. It is known by numerous texts and accordances during a long succession of centuries. The difference of the two doctrines does not represent the simple opposition of a sect, but rather a distinction of races marked by one of languages. The documents of that country which are not Babylonian are written in an idiom called Sumerian by M. Oppert and Accadian by M. Lenormant, or rather two dialects distinguished by those names, representing a language analogous to that of ancient Media.

The preserved copies of the Sumerian or Accadian mythological texts came from a royal library (of clay cylinders) of the seventh century before the Christian era, where they were preserved with, and without, Assyrian translations; the texts themselves go back to an epoch very ancient, and far anterior to the fifteenth century B. C. Among them also is a mythological epic poem in the Babylonian language, in which there is a recital of the Deluge nearly like that in the book of Genesis.

Ascending further back into the pre-monu-

mental periods from which these texts descend, we draw nearer to a monotheism of which the character is more or less exalted, or more or less gross, according to the races of men; and which passes very easily into a real polytheism, but which, nevertheless, manifests itself as a point of departure, and not as a point of arrival.

M. Pictet, in his "*Origines Indo-Européennes*," establishes also the spiritualistic character of the primitive civilization of the whole Aryan race, by going back to the epoch when the Hindoos, Slavs, Iranians, Celts, Hellenes, and Germans, lived together and spoke only one language; or, to express it more precisely, by ascending up to the epoch when the common ancestors of all these people formed only one great Japhetic tribe. The common roots of different Indo-European languages, expressing sensible objects, have enabled him to recognize very many elements, both material and intellectual, of the ancient civilization, which was that of our common ancestors; and the proper signification and etymological relations established by the comparison of words representing moral and religious habits, offer a forcible and solid answer to that hypothesis which assumes that the point of departure of the human race was from a bestial state.

There are extensive and numerous Egyptian texts ascending up to the epoch of the sixth, fifth, and fourth dynasties, and some lines whose date was at the end of the third dynasty. It was during the fourth dynasty that the great pyramids of Gezeh were built. The inscriptions are most frequently funeral. There is found, also, in one of the tombs of that epoch, an autobiography of a high functionary, a real page of contemporary history. There is also, on papyrus, a book on morals and religion, composed a very few generations after the construction of the great pyramids; and a copy of that book which has been traced to the time of the ninth dynasty, a number of centuries anterior to Moses. Religious and historical texts abound on the monuments of the twelfth dynasty; and the eighteenth dynasty, which is wholly anterior not only to the writing of the Pentateuch, but probably to the birth of Moses, is one of the richest in monuments of every kind; and these monuments have been decorated with a profusion of hieroglyphic texts.

At the age of the pyramids, an epoch which nearly touches the cradle of the Egyptian monarchy, probably but little separated from the first dispersion of the descendants of Noe, the fundamental principle of the religion of Egypt was monotheism, or one God. But very early also, the imperfect language of that theology, the figurative denominations by which it expressed the attributes or the acts of the divinity, afforded an occasion for polytheistic and mythological interpretations which, without doubt, dominated the popular sentiment of an epoch very remote.

Mythological polytheism grows toward the Græco-Roman period. Monotheism becomes

enfeebled and obscured as the centuries from a more remote antiquity accumulate.

In 1855, in a summary notice of the Egyptian monuments of the Louvre, M. de Rouge thus expressed himself: "It will be very incorrect to think that the multitude of divinities adored by the Egyptians had completely obliterated from their minds the knowledge of the Supreme God, whatever may be the local name which they gave to him. He is often designated by expressions which do not permit a doubt on that point. 'He is the only being in truth living,' said the sacred legends; 'He has given birth to all beings and to all inferior Gods'; 'He has made all things, and he has not been made'; finally, 'He has begotten himself.'"

The Egypt which Menes united under his scepter was divided into nomes, having each a capital city; each one of these regions had its principal deity, designated by a special name; but it is always the same doctrine that is expressed by the different names.

"God is the creator"; "He has made the heavens," "He has created the earth," "He has made all things which exist." "Thou art alone, and the millions of beings come from thee"; "He is the Lord of beings and of non-beings." These texts are at least fifteen hundred years older than Moses.

"God has regulated the order of nature." From him comes likewise the moral element. Murder, theft, adultery, fraud, are pursued in his name through all the details of social life. The sanction to that morality which is so complete is not wanting: it is the immortality of the soul.

A treatise on morals, called by M. Chabas the oldest book in the world, is the work of Phata-Hoteph, a son of King Assa. This belongs to the fifth dynasty, and invokes Osiris; but this Osiris, the only god of Egypt named in the manuscript, is the abstract idea of the divinity. It occurs frequently in the text. The same name Osiris signifies *the seat of action*, that is to say, he *who made all things*.

A sarcophagus of the eleventh dynasty bears these words, which have been found in the seventeenth chapter of the treatise of Phata-Hoteph: "I am the great existence by myself; I am the law of the existence of beings."

In that chapter seventeen is also clearly expressed the idea of purification necessary to a human being, and that of moral responsibility is very lengthily explained to the hundred and twentieth chapter, where are enumerated the faults of which the deceased should be innocent in order to be deified in the other world; an enumeration which expresses, especially in the most ancient manuscripts, a very elevated moral sense.

In the new Egyptian empire, which commenced with the eighteenth and nineteenth dynasties, the mythology is more developed; but the current of the ancient traditions continues to struggle against the invasion of poetic

or popular dreams. At the beginning of the nineteenth dynasty, the period of the youth and ripe age of Moses, is clearly seen the tradition of the sanctuaries still maintaining itself in the liturgic poetry.

M. MARIETTE'S RESEARCHES IN EGYPT.—Extensive excavations were conducted in Egypt for several years previous to 1881, under the direction of M. Auguste Mariette, more recently known as Mariette Pasha, who, after spending four years on his own account in exploring and laying open the remains of the Serapeum, or tomb of the Apis bulls at Memphis, was appointed by the Khedive Ismail Conservator of Monuments to the Egyptian Government, a position which he held for more than twenty-five years, till his death, in January, 1881. His works were executed in different parts of the country where objects of prominent interest could be looked for, and included the disinterment of the magnificent temples of Denderah and Edfoo, and the recovery of thousands of valuable inscriptions; the uncovering of the Sphinx, and the discovery of the mysterious building known as the Temple of the Sphinx; extensive operations at Karnak, Deir-el-Baharee, Medinet Haboo, and Abydos; the projection of a systematic exploration of the pyramids, beginning with those at Memphis and Sakkara; and the formation of the museum at Boolak, where it is designed to store and preserve, under the eye of the Government, all the portable antiquities that may be found. At the time of his death M. Mariette was contemplating, in further investigation, the search for, and exploration of, the ruins of This or Teni, the seat of the foundation of the empire and of the royal house of Menes; the examination of the wall-decorations of the tombs of the ancient empire, which, formerly supposed to represent actual scenes in the life of the deceased, he believed, from the uniformity of their character, and other evidences of their ideality, rather to shadow forth the views of the future life, and to be capable of affording valuable illustrations of the ritual and theology of the Egyptians; and a more thorough examination of the Sphinx, to discover whether there be a tomb, or chamber, hidden within it.

OPENING OF PYRAMIDS.—The work begun by M. Mariette was taken up where he left it by his successor, M. Maspero, who, with Dr. Brugsch, is continuing it on the same general plan, and with the same ultimate ends in view, that were entertained by him. Among M. Mariette's last work was the opening of three of the pyramids at Sakkara: those marked on Perring's Map of the Pyramids as numbers 5, 6, and 8. The last-mentioned pyramid was found to be bare. Of the other two, number 5 proved to be the pyramid of Pepi Rameri, and number 6 that of his son and successor, Merenra, of the sixth dynasty, two of the most distinguished monarchs of the ancient empire, of whose reigns we have also in the biography

of a high officer, Una, who served under them, the most satisfactory contemporary record yet discovered in the tombs. The pyramid of Pepi, who is supposed to be the Phiois II of Manetho, contained two chambers, only one of which is accessible. The walls of this one bore long and remarkable inscriptions, while fragments of other inscriptions were lying around on the floors. The sarcophagus, of basalt, had been partly destroyed, but was seen to be of extraordinary massiveness, being 106·5 inches in length, with the sides 12·2 and the bottom 20 inches in thickness. It contained a wooden coffin, with a body, not embalmed, but wrapped in a cerement of very fine linen, steeped, probably, in cedar-oil, which was removed to Boolak. The sarcophagus bore the inscription, "The Life of the King of Egypt, Ra \* \* \* i [Rameri], the Ever-living." Near the sarcophagus was a monolithic square box or well, of granite, with a lid of granite propped up, but without grooves or pin-holes. The inscriptions in the chamber relate entirely to the religion, and not at all to the history, of the king. In them he is always named Pepi, the second name not occurring in the chamber itself, but only in the passage, where it is un mutilated, and may be read easily as Rameri. Many places are named, among them An (Heliopolis) and Abood (Abydos), but not Thebes.

Professor Maspero began his work, in February and March, 1881, with the opening of Pyramid No. 4, of Perring's map, which proved to be that of Unas, the last king of the fifth dynasty, a monarch whose name—erroneously, as it now appears—had been before associated with the flat-topped pyramid known as the Mastabat-el-Faraon. The chamber had already been violated by the tomb-breakers of the Græco-Roman period. The corridor was lined with polished granite and fine limestone, the latter covered with hieroglyphics filled in with green, and the ceiling was adorned with stars of the same color. This passage led into a chamber with inscribed walls, whence another corridor led to a chamber containing niches for funereal statues, and thence a passage next ending in the burial-chamber of the king. Three of the walls of this chamber were covered with inscriptions, and the fourth wall with fine alabaster richly painted with decorative designs. The texts on the walls are almost identical with those upon the walls of the tomb of Pepi Rameri, and are similar to other texts found on certain little-known tombs at Thebes. The sarcophagus was of black basalt, with no inscription. The lid lay in one corner of the chamber, and the mummy had been pulled out and broken up, so that only fragments of it were recovered, though it is hoped that other parts of it may be found in the rubbish. M. Maspero next projected the excavation of the pyramid of Meydoun, which is associated with the name of Senefru, the next to the last king of the third dynasty, but his success here was anticipated by the discovery in July,

1881, of the mummies and relics of the kings, queens, and princes of the seventeenth, eighteenth, nineteenth, and twenty-first dynasties at Deir-el-Baharee, near Thebes.

**DISCOVERY OF ROYAL MUMMIES AT THEBES.**—The existence of an important deposit among the hills west of Thebes had been known for many years to the Arabs, who carried on a lively trade in the relics they took from it, and carefully kept the knowledge of its situation to themselves. The attention of Daoud Pasha and Herr Emil Brugsch was drawn to the matter by the appearance of an unusual number of relics in the market, and they secured the arrest of the Arab who appeared to be the leading dealer, and extorted from him a revelation of the hiding-place. In a rock chamber hitherto unknown, behind an ancient temple, were found twenty-nine mummies, of which seven were of kings, nine of queens and princesses, and five of persons of distinction, many of them with the flower-wreaths which were deposited on them at their burial, still lying withered on their breasts, 3,700 mortuary statues, a large leather tent or canopy, and a number of papyri, four of which were very large and quite perfect. The mummies had evidently been brought to the place in haste, and had been deposited there in some confusion. Some of them were in cases not their own, and several cases were without occupants. The identification of them was consequently difficult for a little time; but the following list, which is arranged by dynasties, was finally determined upon as correct. The asterisk indicates a mummy-case from which the mummy which is presumed to have been originally present, but afterward removed or stolen, is missing.

**SEVENTEENTH DYNASTY.**—(Approximate date) B. C. 1750 to B. C. 1703. King Rasekenen Taaken, Queen Ansera. **EIGHTEENTH DYNASTY.**—(Approximate date) B. C. 1703 to B. C. 1462. King Ahmes Ra-neb-pehti (who completed the expulsion of the Shepherd Kings), Queen Ahmes Nofretari, Queen Aah-hotep, Queen Merit-Amen, Queen Hotimoochoo, Prince Se Amen, Princess Set-Amen, King Amenhotep I, King Thothmes I,\* King Thothmes II, King Thothmes III, Queen Sitka. **NINETEENTH DYNASTY.**—(Approximate date) B. C. 1462 to B. C. 1288. King Rameses I,\* King Seti I, King Rameses II (the Sesostris of the Greeks, and regarded by most Egyptologists as the Pharaoh under whom Moses was brought up). **TWENTIETH DYNASTY.**—Not represented. **TWENTY-FIRST DYNASTY.**—(Approximate date) B. C. 1110 to —? Queen Notem-Maut, King and High-Priest Pinotem I, King Pinotem II, Prince and High-Priest Masahirti, Queen Hathor Hout Tani, Queen Makara, Queen Isi-em-kheb, Princess Nasi Khonsu, Prince Tat-f-Ankh, Nebeni (a priest), Noi Shounap (a priest). It is supposed, and some hieratic inscriptions made on the mummy-cases of Seti I and Rameses II at the time of the removal confirm the supposition, that the mummies and treasures were

removed to this spot during some time of disorder, for concealment and preservation.

**THE PYRAMID OF SENEFRU, AT MEYDOUM.**—The discovery of the entrance to the pyramid of Senefru, at Meydoun, was published at the beginning of 1882. This pyramid is called by the Arabs the false pyramid, because they believe it to be formed of the rock itself. It is built in three stages, each of which is inclined

excavations of them for the purpose of learning their real significance. Dr. Brugsch Pasha and M. E. Revillout have begun a study of the demotic papyri of the times from the twenty-sixth dynasty down, of which several thousand documents exist in the European libraries. The demotic was the business and familiar hand of the Egyptians, and these papyri are expected to throw a flood of light upon their

THE PYRAMID OF MEYDOUM.

at an angle of  $74^{\circ} 10'$ , and rises to a height of one hundred and twenty-two feet from the midst of a high hill of fallen masonry and rubble. The outer masonry is of admirable workmanship, and the general effect of the structure is imposing. The pyramid proved to be formed, for at least half its height, around a core of natural rock. The entrance gave access to a steep descending passage leading down into the living rock, with chambers constructed on a plan reminding the explorers of that of the corresponding chambers of the great pyramid. No inscriptions were found except brief hieratic writings recording the visit of two scribes in the twentieth dynasty. This pyramid is considered to be nearly one hundred years older than the great pyramid of Gizeh. Its date would be, according to Brugsch's chronology, 3766, according to Mariette's, 4200, B. C. M. Maspero believes that the pyramids, beginning with those of the fourth dynasty at Gizeh and ending with those of the thirteenth dynasty at the Fayoom, represent the tombs in succession of the monarchs of those and the intervening dynasties, whose history is as yet wholly unknown; and he has, since the conclusion of the recent war, resumed his systematic

laws, social condition, and every-day and private transactions.

**RECENT ASSYRIAN AND BABYLONIAN RESEARCHES.**—The investigations in the mounds of Assyria and Babylonia continue to furnish information of the highest interest and value. Copies of the records and literary works of hundreds and perhaps thousands of years were accumulated in the library of Assurbanipal at Nineveh, and are now recoverable, in a state more or less mutilated, it is true, but of approaching completeness for many works. Another library of still older date was discovered in 1881 at Sippara, in Babylonia. The Chaldean narratives of the creation and the deluge, first brought to notice and translated by Mr. George Smith, from the library of Assurbanipal, have been restudied, retranslated and revised, with the result of depreciating some of the resemblances which Mr. Smith thought he could trace between them and the Biblical record, but without essentially destroying their general parallelism with the Hebrew sacred narrative. The Assyrian historical narratives are clear and precise, and furnish definite statements of the chronological relations of events to each other, by which their dates according to our

notation can be accurately fixed in many cases to within a few years. In this respect they are of much greater value than the texts of the Egyptians, who, so far as appears from any of their documents yet discovered, seem to have had no historical sense. The contract tablets, commonly known as the Egibi tablets, extending from the first year of the reign of Nebuchadnezzar II to the reign of Darius Hystaspis, give an almost unbroken series of dates, which are in nearly precise agreement with the corresponding dates furnished by the canon of Ptolemy. Among the more recent discoveries is a document containing a list of about two hundred of the earliest kings of Babylonia, beginning with the first kings after the flood, and apparently corresponding, to a certain extent, with the first six or seven dynasties of Berosus. Investigations at Tel-loh, the Zirgula of antiquity, by M. de Sarzec and Mr. Hormuzd Rassam, working independently of each other, have brought to light relics of kings of the thirteenth and fourteenth centuries before Christ, and statues and inscriptions indicating that the earlier period of Chaldean art was better than the later, or Assyrian period. A tablet found here, a copy of the original work, gives a synchro-nous history of Assyria and Babylonia, relating the occasions when, either for peace or war, the rival monarchies came into contact, and enables us to determine the dates of their kings and to reconcile some discrepancies that seemed to exist in other lists. The events treated of in this document occurred between 1400 and 891 B. C. At Abou-haba, about sixteen miles southwest of Bagdad, Mr. Rassam has discovered the ruins of Sippara, the seat of the sun-god worship, one of the most ancient cities of Babylonia, and the place where, according to the story of the deluge as related by Berosus, Xisuthrus buried the tablets giving the account of the flood, and "the history of the beginning, progress, and end of all things." Here Mr. Rassam was so fortunate as to find, almost at the beginning of his investigations, the temple of the sun-god itself, and within it a memorial stone bearing figures emblematic of the sun-worship, and inscriptions, among which were the words, "To the Sun-god, the great lord, dwelling in Bit-Parra, which is within the city of Sippara." The stone is dated in the reign of Nabupaliddina, of the ninth century B. C., and speaks of the destruction of the original temple by invaders called the Sutu; then relates that Simas Signu, the fortieth in the list of two hundred early kings already referred to, commenced its restoration, and that the work was carried on by another monarch, E-Ulbar-Sakin-Sumi, or E-Ulbargarmu, but that it remained for Nabupaliddina finally to destroy the Sutu and complete the building. The stone seems afterward to have been broken, and repaired and inclosed in an earthen box, in which Mr. Rassam found it, probably in the time of Nabopolassar, and the temple to have been subsequently repaired and

adorned by Nabonidus, who placed in it clay cylinders recording the event. The monuments found here indicate the existence of another city of Sippara, called Sippara Anat, which Mr. Rassam also probably identified, and the twin cities are believed to correspond with the Sepharvaim of the Bible. In the mounds of Hubi Ibrahim, or Tel Ibrahim, some ten miles east of Babylon, Mr. Rassam found the ruins of the city of Cutha, the chief literary and scholastic center of the Babylonians, whence came the "men of Cutha," who were placed in Samaria by the Assyrian conquerors (2 Kings, xvii, 24, 31), and identified there the great temple of the war-god Nergal, "the god of Cutha" of the book of Kings, and his consort Laz. One of the cylinders deposited by Nabonidus in the temple at Sippara, when he made repairs in it, as related above, bears inscriptions in which occurs a statement that when burrowing beneath the temple, forty-five years after Nebuchadnezzar had sought for the ancient cylinders in vain, he had had revealed to him "the cylinder of Naramsin, son of Sargon, which for 3,200 years no king going before me had seen." These 3,200 years added to the date of Nabonidus, say B. C. 550, would give for the date of Naramsin, B. C. 3750, two thousand years earlier than the date assigned to him by Mr. George Smith, and about 1,600 years earlier than the earliest date previously definitely specified in the cuneiform inscriptions. The inscriptions of the time of Gudea, one of the earliest monarchs whose statues were found at Telloh, or Zirgula, show that a lively intercourse already existed in his remote time between Chaldea and Egypt.

THE HITTITES.—Much advance has been made within three years in the knowledge of the Hittites, of whom little had been known except what was suggested in a few brief references in the Bible and in the Egyptian accounts of their Asiatic wars, where they are called the Kheta. The Hittites have been proved, however, to have been a very considerable nation in the ages previous to the Trojan war, who probably played as important a part in the history of the world as the Assyrians or Egyptians, and of whom Brugsch, calling them a "powerful and cultivated people," says that "their rule in the highest antiquity was of an importance which we can now only guess at." They were at times among the most formidable enemies with whom the Egyptians had to contend; at other times their valuable allies. The first regular treaty of which there is a record, and of which a copy is preserved, was between their king and Rameses II, and contained provisions worthy of the highest civilization of modern times. The study of their monuments, of which the formerly puzzling and wholly unintelligible inscriptions, called the Hamath inscriptions, were a part, and of other contemporary records, has shown that their empire, or their influence, formerly extended from their southern capital at Ka-

desh on the Orontes to the Ægean Sea; that from the seventeenth century to the twelfth century B. C., they were the leading power of Western Asia, holding the balance of power between Egypt on the one side and Assyria on the other; and that it was through them that Assyrian civilization was transmitted to the Phœnicians and thence to the Western nations. Their capital, Carchemish, was identified by Mr. J. H. Skene and Mr. George Smith, during the last expedition of the latter gentleman to the East, at Jerablis, on the Euphrates River, a short day's journey south of the town of Bir-edjek. This city gave its name to the Mina of Carchemish, which was for centuries the standard weight throughout Asia Minor, and is mentioned in the Assyrian inscriptions. A second Hittite capital was identified by Lieutenant Conder in 1881 at Kadesh, on an island in the Orontes River, the present leading topographical features of which are almost exactly reproduced in a representation of the siege of Kadesh on the Egyptian monuments. Two figures of a warrior carved in the rocks at the pass of Karabel, now known to have been established by the Hittites as evidences of their dominion, have been identified with the figures described by Herodotus as existing in that region, and supposed by him to have been erected by the Egyptian Sesostris as memorials of his conquest.

The Egyptian and Chaldean monuments and inscriptions, revealing purer religious notions and higher moral principles, and displaying better taste in design and greater skill in execution the further back in antiquity we trace them, demonstrate that, among historical nations at least, the earliest generations were equal, if not superior, in spiritual discernment, intellectual capacity, and the essentials of civilization, even if they had acquired less of the knowledge that comes from observation (which is not shown), to those which succeeded them. Not till the period of the bloom of the Greek intellect in the age of Pericles do we find evidences of as high a civilization as prevailed in the first six Egyptian dynasties and in the earliest Chaldean empire.

**ELECTRICAL ENERGY, STORAGE OF.** The importance of a thoroughly commercial secondary or storage-battery to the future industrial development of electricity can hardly be overestimated. Without it, the current generated by the dynamo-machine must be used at the time and rate of production; but with it, this is no longer necessary, as the energy stored up in it by the primary current may be utilized within certain limits at any time and rate desirable. Further than this, it allows of electricity being used under circumstances inadmissible with currents direct from a machine, and also enables the current to be generated by various sorts of motors which can not well be used when the current is to be directly applied. It enables us further to practically convert currents of high tension, which are the most economi-

cal to transmit to a distance, into those of low tension suitable for domestic and industrial use, and thus becomes a very important factor in any extensive system of distribution, and in the transmission of power.

The possibility of storing the energy of an electric current, by means of such a battery, depends upon the fact that the electric battery, like the dynamo-machine, is reversible. As is well known, a dynamo-machine may be used either to generate a current when mechanical power is spent in rotating its armature, or in producing mechanical power when a current is caused to circulate in the coils of its armature. Similarly, a voltaic cell may be made to yield a current of electricity by the performance of chemical work, and then to do chemical work by the expenditure of electrical energy upon it. In the ordinary voltaic cell, the current is due to the chemical changes undergone by certain materials, commonly zinc and acid. If we burn a piece of zinc in the air, that is, allow it to unite chemically with oxygen, its store of energy runs down and manifests itself as heat, just as the store of energy in coal is given out as heat when the coal is burned. In the electric battery, however, the zinc is burned indirectly, and a part of its energy becomes available for the maintaining of an electric current. When the zinc has united with the acid to form sulphate of zinc, its store of energy becomes exhausted, and further work can be obtained only by a continued supply of the metallic fuel. If there were no other way of renewing this supply of fuel except by the direct furnishing of more of the metal, such a battery would be useless for any purposes requiring a considerable expenditure of energy, owing to the high price of the zinc as compared with coal. There is, however, another way. In the case of coal, there is no way of separating the carbon from the oxygen with which it has combined in combustion, and our supply of energy can therefore only be maintained by keeping up the supply of the coal. In the case of an electric battery, however, it has been discovered that, after the zinc has combined with the oxygen of the liquid, it can be recovered from its solution and again deposited in the metallic form, so as to be again available as a source of energy. To recover this fuel, it is only necessary to send a current of electricity through the battery in the opposite direction to that taken by the current furnished by the battery, when all the operations of the battery will be reversed, and it will again be in a condition to furnish a current. To separate the zinc from the oxygen with which it is combined, of course requires power, and if to exert this power it were necessary to consume zinc in another battery, there would be no gain. But we are not compelled to do this. We can use the vastly cheaper energy of coal to generate our current, through the medium of the dynamo-machine, and thus produce our battery-current at a cost within the limits of economic

requirements. When we send a current through a battery in this manner, its energy is employed to tear away the zinc from the oxygen with which it is combined. This liberated zinc constantly tends to recombine with the oxygen, and in so doing sets up a current opposed to the charging one; this latter current must, therefore, have a sufficient electro-motive force to prevent this recombination. The counter-electro-motive force manifests itself even in ordinary batteries while they are furnishing a current, resulting in its gradual weakening. In this case a portion of the zinc is separated from the solution by the action of the liberated hydrogen, and this zinc in reuniting with the oxygen sets up an opposing current.

This action was noticed very shortly after the invention of the voltaic cell, and the improvements successively made in this cell have been chiefly with a view of preventing, or at least minimizing, this counter-action. The phenomenon to which the name "polarization of the electrodes" was given, was studied by many eminent electricians, but it was not until taken up by M. Gaston Planté that it received a thorough and comprehensive treatment, or that a practical form of cell for utilizing the secondary current was produced. Ritter, of Jena, observed the phenomenon of polarization in 1803, while studying the chemical action of currents upon liquids, and later constructed a secondary pile consisting of a series of disks of copper separated by disks of cloth moistened with sal-ammoniac.

The phenomenon of polarization was placed upon its true basis by the researches of Volta, Marianini, and Schönbein, some years after the experiments of Ritter, and our knowledge of it further enlarged by the labors of Davy, De la Rive, and Faraday. In 1842 Grove constructed his now well-known gas-battery, which consisted simply of two plates of platinum dipped into acidulated water. A current being passed through this battery, the water is separated into its constituents, oxygen and hydrogen. Platinum possesses the property of condensing these gases upon its surface. One of the platinum plates becomes coated with oxygen, and the other with hydrogen, as the decomposition of liquid proceeds. These gases constantly tend to reunite, and, when the charging current ceases, the energy stored in these separated gases is given out by their recombination—as heat if the gases are mixed and burned, as electric energy if the gases are allowed to recombine through the liquid. The subject was taken up in 1860 by M. Planté, who re-examined the whole question, and experimented with many different metals as electrodes and many different liquids as electrolytes. His experiments resulted in showing that the best results were given with lead electrodes immersed in dilute sulphuric acid. Such a cell can furnish no current before it has first been charged by means of a current, as there is no chemical difference between the plates.

When, however, a current is sent through the cell, the liquid is decomposed, and the oxygen escaping at one electrode combines with the lead, covering its face with a film of peroxide. Planté found that to get this film sufficiently thick and also to get the other plate in the best form for effective action, the current had to be sent through the cell a great number of times, first in one direction and then in another. When the current is reversed, the hydrogen liberated combines with the oxygen already on one electrode to form water, leaving this plate with a spongy metallic surface which facilitates its conversion into peroxide of lead when the current is again sent in the opposite direction. After being charged and discharged a number of times, the plates are in a shape for effective use, one plate being coated with peroxide of lead, and the other having a spongy, metallic surface. Upon then closing the circuit of the battery a current is produced which continues as long as there is a chemical difference between the two plates, the chemical action which takes place being the partial reduction of the oxidized plate, and the oxidation of the metallic one. Planté applied his battery to various industrial uses, chiefly in surgical cautery; but the time required to prepare the cells for use, as also that necessary to store up a charge, was too great, and the capacity was also too small to allow them to have any extended application in the rapidly developing electrical appliances of the present time. In 1880 M. Camille A. Faure made a change in the Planté cell, which, though very simple in itself, was of great industrial importance, as by it the storing capacity of the cell was largely increased, and the time necessary to charge it much reduced. M. Faure's improvement consisted simply in coating both electrodes mechanically with red-lead. With this construction the oxide on one plate is reduced, and the other plate further oxidized to the peroxide, when a charging current is sent through the cell. This battery, having an immediate commercial value, has been put very prominently before the public, and its merits examined into by a number of competent experts. Since Faure showed that the secondary battery could become commercially serviceable, the attention of inventors has been largely turned in this direction, and various different accumulators have been brought out, the object of the improvements being to reduce the weight of material as much as possible in relation to its storing power. To this end M. de Meritens has devised a cell in which the lead plates are constructed of thin, overlapping laminae arranged in a manner similar to the slats of Venetian blinds. It is more powerful than a Faure cell of the same weight. In another cell, devised by Messrs. Sellon and Volckmar, the lead plates are perforated and the red-lead forced into these perforations, thus giving a much greater amount of the oxide per pound of the metal than when oxide is on the surface

simply. In the accumulator of M. de Kabath, increased surface is obtained by the use of a great number of thin, corrugated plates. Mr. C. F. Brush, the inventor of the well-known arc lamp bearing his name, has also experimented extensively with lead accumulators, and has produced one which his company in this country intend to use for supplying incandescent lamps. His improvements consist in various modes of constructing the plates, so as to render them durable, and increase their storage capacity. A storage-cell, which is in fact a reversible Daniell battery, was devised by Messrs. Thomson and Houston, of this country, in 1879. This cell consists of two sheets of copper placed horizontally one above the other in a solution of sulphate of zinc. The current, in charging, is sent through the battery from the top to the lower plate, when the upper plate dissolves, forming sulphate of copper, which floats upon the sulphate of zinc. Metallic zinc is deposited upon the lower plate. This cell will yield a current as long as there is a chemical difference between the electrodes; that is, until the zinc is all reconverted into the sulphate. This has been modified by M. d'Arsonval, who makes use of an electrode of lead, or of carbon covered with lead shot, and one of zinc. When the cell is charged, the zinc is deposited upon the zinc plate and the lead peroxidized.

A battery which has received very little attention, but which seems to be superior to any other yet produced, is one invented by Mr. Henry Sutton, of Ballarat, Victoria. It was described by him in a paper before the Royal Society, London, in December, 1881. Mr. Sutton experimented with both the Planté and Faure batteries, and tried many different combinations. He finally found that positive electrodes of amalgamated lead produced the best results, and, in experimenting with a view to determining the best negative electrode, came to the conclusion that, "by having negative electrodes whose oxides should be soluble in the solution, and which could be redeposited from the solution, or by having metallic solutions from which metal could be deposited, the resulting solution being such that should, on the oxidation of the deposited metal, combine with the oxide and again form the original solution," he would obtain "a powerful and constant source of stored energy." To this end he tried cells in which the negative electrode consisted of zinc, iron, or copper, and the positive of amalgamated lead, the liquid being in each case the sulphate of the metal of the negative electrode. Zinc was abandoned, because of the necessity of amalgamating it to prevent local currents, and the iron because of its oxidation when the cell was not in use. The form of cell, therefore, finally adopted consisted of an amalgamated lead plate for the positive and a copper plate for the negative electrode, the liquid being sulphate of copper. The chemical action in this cell, when a current is sent

through it, consists in the combination of the oxygen of the decomposed solution with the lead, forming a coating of the insoluble peroxide, and the replacement of the copper in the solution by the disengaged hydrogen, the copper being deposited on the negative plate. When the action is complete, the positive electrode is oxidized, the negative coated with copper, and the solution converted into hydric sulphate and water. In discharging, the copper is dissolved in the solution and the lead plate reduced, the cell returning to its original chemical condition. A practical form of the cell consists of a series of amalgamated plates, fitted in grooves in a box, as in Cruikshank's trough-battery, the spaces between the plates being filled with a solution of sulphate of copper. The positive sides of the plates then become peroxidized, and the negative sides coated with copper. The inventor states that the cell is in every way superior to the Faure, and, wishing to preserve it free from any private claims, he has refrained from taking out any patents upon it.

The value of the secondary battery as an element in industrial applications of electricity depends both upon its efficiency—that is, the percentage of the work expended upon it which can be utilized—and upon the cost of production. This latter, of course, depends directly upon the former, and both together determine the investment necessary in any case. It is chiefly as a question of investment that the efficiency has importance, as the item of fuel is a comparatively small one in comparison with that of the investment in any considerable electrical plant.

The Faure is as yet the only cell which has been experimented upon to any extent, but the results so far obtained by different experimenters are discordant, and it is not yet known what the efficiency of this cell is. There are certain conditions that must be observed, both in charging and discharging, and if these are not fulfilled the results may fall very far short of the maximum. If the charging is done too rapidly, part of the energy is wasted as heat in the cell, and if the discharge takes place too quickly, energy is also wasted by the production of heat. Care must also be taken that the cell is completely discharged. A peculiarity of the secondary battery is that, after being rapidly discharged, it will yield, upon standing some time, one or more residual charges, which may be greater than that first given off. In order to charge such a battery with the least loss of energy, the charging current should be of ample quantity, and of an electro-motive force but slightly in excess of that which the battery can attain. The discharge should be made through a resistance that will prevent its being too rapid. The best rate of discharge must be found by experiment. The first careful experiments upon the Faure cell were made at the Conservatoire des Arts-et-Métiers, in January of this year, by M. Tresca and his associ-

ates, the results of which were communicated to the French Academy in March. The experiments were undertaken to obtain—1. The mechanical labor expended in charging the battery. 2. The quantity of electricity stored up during the charge. 3. The quantity of electricity given out during the discharge. 4. The electrical work actually effected during the discharge. And they showed that of the total quantity of electricity introduced in the battery, 90 per cent was given out again, and that 60 per cent of the total electrical work spent in charging was recovered during the discharge. The accumulator therefore absorbed 40 per cent of the electrical work that would otherwise have been available in the lamps through which the discharge was made. So great a loss as this would place the accumulator without the limits of commercial utility in most cases, if further experience shows that this is the utmost efficiency to be obtained. The results of various other experimenters, however, show the loss to be considerably less. Sir William Thomson concluded from his experiments that the probable loss in charging is 10, and in discharging 15 per cent, while Professor Ayrton states that this loss, in a well-constructed cell, properly charged and discharged, need not exceed 18 per cent, and, if the discharge be sufficiently slow, this may be brought down to 10 per cent. If so high an efficiency as 80 per cent can be obtained in actual use, it is very probable that the accumulator will be found a thoroughly practical apparatus, which can be used with advantage in almost all the applications now made of powerful electric currents. But whether its efficiency reach this figure or not, it may still be a valuable adjunct in many cases, for it must be borne in mind that its real value in a commercial sense is not determined solely by its own efficiency. If by its use the efficiency of other apparatus forming an element of an electrical system can be raised, the gain might in some cases be sufficient to nearly, if not quite, neutralize the loss due to the accumula-

tor itself. In the case of incandescent lighting it is quite possible that the efficiency of these lamps may be considerably increased, as there is no danger of the lamps being destroyed by a sudden increase of current, and they may therefore be run nearer their breaking limit, and consequently more economically. The life of the lamp will probably also be found to be greater than when run direct from the machine. The advantage of an apparatus in a system of distribution which increases the reliability of the supply is one of no small amount, and may rightly be considered to have an economic value.

Too little is yet known, both of the first cost of accumulators and of their depreciation, to be able to judge whether their use will decrease the investment necessary, in a system of distribution, below that required without them. In this country the Brush Electric Light Company proposes to place accumulators in the houses of consumers, and charge them with the currents used for its arc-lamps. A large number of local Brush Companies are now engaged in furnishing arc-lamps, and have the plant for the purpose. These lamps are in use at the most from six o'clock in the evening until six the next morning, so that the plant is idle, or nearly so, twelve hours out of the twenty-four.

By using accumulators, this plant can be run continuously, and a saving of course effected, so far as machines and street conductors are concerned. The company has as yet furnished no figures as to the investment required for the storage-batteries, and hence the economic feasibility of the plan can not be determined, though the company asserts that in this regard it is entirely satisfactory.

The only figures yet given of the price of accumulators are those recently put forth by the Electrical Power Storage Company, of England, which has begun the manufacture and sale of the Faure-Sellon-Volekmar and the Sellon-Swan batteries. The company has issued a circular in which information is given as to

E. M. F. of lamp in volts.	Number of cells composing accumulator.	Rate of discharge in amperes.	Maximum charging capacity in amperes.	PRICE OF ACCUMULATOR.	
				Sellon-Swan.	Faure-Sellon- Volekmar.
				£ s. d.	£ s. d.
45	22 one E. H. P. ....	30-40	400	110 0 0	79 4 0
45	22 two " .....	60-80	800	220 0 0	158 8 0
45	22 five " .....	150-175	2,000	550 0 0	396 0 0
50	25 one " .....	30-40	400	125 0 0	90 0 0
50	25 two " .....	60-80	800	250 0 0	180 0 0
50	25 five " .....	150-175	2,000	625 0 0	450 0 0
60	30 one " .....	30-40	400	150 0 0	108 0 0
60	30 two " .....	60-80	800	300 0 0	216 0 0
60	30 five " .....	150-175	2,000	750 0 0	540 0 0
100	50 one " .....	30-40	400	250 0 0	180 0 0
100	50 two " .....	60-80	800	500 0 0	360 0 0

110	55 one " .....	30-40	400	275 0 0	198 0 0
110	55 two " .....	60-80	800	550 0 0	396 0 0
110	55 five " .....	150-175	2,000	1,375 0 0	990 0 0

the proper rate of charge and discharge, the size of the cells, and their price. From this circular it appears that cells of three sizes—

one, two, and five horse-power—are at present manufactured; the rates of economical charge and discharge of which are:

	Charge.	Discharge.
	Amperes.	Amperes.
One H. P. cell .....	20- 25	30- 40
Two H. P. cells .....	40- 50	60- 75
Five " " .....	100-125	150-175

The electro-motive force when the cell is first charged is 2.15 volts, and this can be maintained, the circular states, until three fourths of the charge is withdrawn, if the cell be used at the rate of discharge given above. The table on previous page gives the number of cells necessary with different lamps, the total electrical capacity, and their price.

An examination of the above data will show that these cells are very far from answering the commercial requirements of a large electric distributive system. Economy in the charging plant and in the street conductors is attained just in proportion as the time of charging is great compared with that of discharging. The above figures, however, make the former rate two thirds of the latter, and hence, taking into consideration the loss occasioned by the use of the battery, the charging machinery would have to be as large as would be required without it, and no material saving would be experienced in conductors. The battery would therefore appear to be an extra charge upon distribution without any special advantage being gained. According to the above prices 61½ Edison lamps requiring a current of 89 volts electro-motive force, and consuming each .65 of an ampère could be maintained 7½ hours with a battery consisting of 45 one horse-power cells. This would make the investment per lamp with the cheaper cell about \$13. For a plant capable of doing the work of a gas-plant furnishing 1,000,000 feet of gas a day, the investment in batteries, at this rate, would be \$520,000, since a maximum of 40,000 burners would have to be maintained at one time. This is about four fifths of the total investment required for a complete direct plant to accomplish the same work. The investment per lamp with the Swan lamp, which requires an electro-motive force of 47.3 volts and consumes 1.47 ampères of current, would be \$15.84; the Lane-Fox, \$18; and the Maxim, \$17.28.

On the basis of these figures the investment required in batteries is so heavy as to prohibit their use in any extended system of distribution, though they could doubtless be employed in many special cases to advantage. These figures can not, however, be well taken as a basis on which to forecast the economic future of the storage-battery. The above rates of charge and discharge are not necessarily the ones which will have to be adopted, and the prices seem abnormally high. Doubtless these will become considerably lower as the manufacture is improved and the demand increased, and it may not unreasonably be expected that they may be brought within the limits of economic requirements. Of course, whether the cost be brought down to the economic require-

ments of a distributive system or not, there will always remain a considerable field for accumulators, which will continually widen as improvements are effected, and may in time be as extensive as the industrial domain of electricity.

ELECTRIC LIGHTING, PROGRESS OF. The progress of electric lighting during the past year has been chiefly in the industrial development of the various systems, rather than in any striking novelties in the apparatus employed, though a steady improvement has gone forward in this direction. The arc-lamp is continually gaining ground as an out-door illuminant and as a means of lighting large interior spaces, and the incandescent is as certainly making its way in house-lighting. With the exception of the first station of the Edison Company in New York city, the incandescent lamp has not yet been furnished to consumers upon a large scale, but all the prominent companies are preparing to do so at an early date. The Maxim lamp is being supplied to consumers in different parts of New York directly from the various arc-light stations of the United States Electric Lighting Company; while the Brush Company, heretofore occupied exclusively with the arc type of lamp, is about to go largely into incandescent lighting, using for this purpose the Swan incandescent lamp, which it is proposed to run from the Brush storage-batteries.

In London the Edison lamp is being supplied over a limited district, as also at various points on the Continent, while active preparations are being made for its very general introduction. The Swan, Lane-Fox, and Maxim lamps are also being pushed forward by the various companies abroad interested in their success. While it can not be said that the incandescent lamp has yet demonstrated its ability to compete with gas generally in the matter of cost, there is no longer any question about its ability to meet successfully all the other requirements of a general in-door illuminant.

The arc-lamp of the form known as the regulator—that is, the lamp in which the carbon electrodes are placed point to point and the distance between them maintained constant by means of mechanism—and the incandescent lamp, pure and simple, seem to be the only types which promise to survive. Electric candles seem to be making but little headway, while the lamps of imperfect contact or incandescence in the open air, such as the Reynier and Werderman, which promised so well but a few years ago, appear to have been wholly abandoned. These latter lamps, though giving considerably less light for a given expenditure of power than regulators, were yet superior to them both in simplicity of construction and in the steadiness of the light yielded. Much as regulator lamps have been improved, their light is still far from steady, and it does not appear probable that any considerable advance can be expected in this direction. Aside from the unsteadiness due to irregularity of feeding

and of inequality in the carbons, there is that due to the shifting of the arc from one point to another on the surface of the electrodes. If the carbons could be very thin rods, the arc would always form at practically the same points, and irregularity from this cause would be inappreciable. The electrodes must, however, be of considerable size to avoid too rapid consumption, and this difficulty, therefore, appears to be inherent in the practicable form of this lamp. The cost of lamps of this type is also very considerable, even with the quite simple regulating mechanism now used in the best forms. In view of these considerations, it may be questioned whether the abandonment of this type of incandescent lamps has not been premature, and whether we shall not yet see a return to it. Though the amount of light yielded by regulators be greater for a given expenditure of power, it does not, therefore, follow that the equal illumination of a given area will be less costly by them, as it is very well understood that any quantity of light properly distributed gives a more effective illumination than a much greater amount at a few centers.

M. Emile Reynier, one of the earliest inventors of this type of lamp, has recently returned to the subject, and has succeeded in producing a lamp free from the objections of the older forms, and of such extreme simplicity as to leave nothing to be desired on this score. In his former lamp, a carbon pencil resting upon an abutment was fed continuously, by means of a weight or spring, past a heavy carbon contact, the portion of the pencil between this contact and the abutment being incandescent. This construction presented mechanical difficulties to the regular feeding that were not satisfactorily overcome, and the contact interfered with the economy by conducting away the heat. In the present lamp two pencils are used, inclined but slightly to each other, so that they touch at a point a short distance from their points, which rest upon small abutments of copper. The contact which limits the incandescence is therefore a hot contact, and hence no heat is wasted by its means. The form of the lamp is shown in Fig. 1. The carbons, A B, are forced downward by the weights, P Q, sliding upon the metallic guides, C D. The abutments, E F, are of

copper, attached to the bronze arcs, G H. The two halves of the lamps are connected by the insulated clamps, I and J. The weights, P and Q, are insulated from the carbons, which they impel by the caps, r and s. The current enters by the terminal, K, follows the brass guide, C, the arm, G, the abutment, E, and the pointed end of the carbon, A, to the contact, x, at which point it crosses over to the carbon, B, and descends through the abutment, F, and passes out by the arm, H, and guide, D, to the terminal, L. No thorough tests have yet been made of this lamp, but M. Reynier states that the results of experiments so far conducted are very satisfactory. The disadvantage of all lamps of this type is the necessity of using very large conductors, as, owing to the small resistance of the carbon-pencil, it requires a current of great strength to bring it to the proper incandescence. Such lamps can not, therefore, be worked economically upon long circuits, but in separate installations, such as the lighting of workshops, this objection is evidently of but small moment. The same inventor has also devised an incandescent lamp in which he has attempted to obtain a sufficient resistance without resorting to a filamentary conductor, such as is used in all the other well-known incandescent lamps. This increased resistance is obtained by cutting the carbon-rod, which serves as the light-giving portion, several times across, or by notching it. This conductor is inclosed in a glass globe, exhausted or filled with a gas which does not unite chemically with the carbon.

New arc-lamps continue to multiply, but nothing of special importance has made its appearance during the year. This lamp has now reached such a condition that improvements to be expected in it are of a kind having a manufacturing value chiefly—such as will decrease the cost of production, and increase its serviceableness in use.

In the matter of generators two new dynamo-machines have lately been brought to the attention of the public in England: one is the invention of Mr. J. E. H. Gordon, and the other that of Sir William Thomson and Mr. Ferranti. This latter was very much talked of previous to being exhibited; but the extravagant expectations in regard to it can hardly be said to have been realized. It is an alternating machine, as is also the Gordon, and on this account it is of but minor importance; for, it is quite safe to say that machines of this class will find but a limited use in the industrial development of electrical appliances. Its merit lies in the great simplicity of its armature, and consequent low cost of manufacture. The armature-wires, instead of being wound on a drum, as in the Siemens, or over a ring, as in the Gramme, are in the form of a zigzag on the face of a central disk, revolving in a magnetic field made up of a number of electro-magnets. The disposition of armature and field is shown in Fig. 2, in which the dark line represents the arma-

FIG. 1.

in Fig. 1. The carbons, A B, are forced downward by the weights, P Q, sliding upon the metallic guides, C D. The abutments, E F, are of

ture-wire, and the oval figures the field-bobins with their iron cores. One end of the armature zigzag is connected with a ring attached directly to the axle, and the other with a similar ring insulated from it. The current is taken

FIG. 2.

off by two rubbers. The field-magnets are excited by a small separate continuous-current machine. The machine exhibited weighed but 1,175 pounds, and yet was able to support 300 Swan lamps, stated to be giving 20 candles each, when driven at 2,000 revolutions per minute. The armature-coil weighed but 18 pounds. An armature of this form has evidently a good many advantages in practical use, one of the chief of which is its little liability of becoming overheated. Its low first cost is also a very important advantage over

production. The only novelty about it is the armature, and that is the invention of Sir William Thomson.

The Gordon machine is chiefly remarkable for being the largest dynamo yet constructed. It is designed to supply 7,000 incandescent lamps with adequate driving power, but it has so far supplied only 1,300. The machine consists essentially of a central disk carrying electro-magnets, and revolving between sets of similar electro-magnets on each side of it. The rotating portion is the field, and the stationary electro-magnets the armature. This latter contains 128 coils, 64 on each side—this being twice as many as in the rotating part. The object of this is to prevent the coils of the fixed series acting detrimentally upon each other by induction, a difficulty experienced in a former machine of Mr. Gordon's, where the coils in the moving and fixed part were equal. The coils of the revolving magnets are excited by a separate continuous-current machine, as is the field of the Ferranti. The total weight of the machine is 18 tons, that of the revolving part being seven tons. Its diameter is eight feet nine inches, and it is designed, when the machine is giving its maximum current, to be driven at 200 revolutions per minute. The tests so far made show a very high efficiency, and the alternating currents are found to work

well with the incandescent lamps. Large as this machine is, Mr. Gordon regards it as a small affair compared to what should be used in supplying lamps from a central station, he having expressed himself as desirous of constructing one with the magnet-wheel 18 feet in diameter. The engraving, Fig. 3, gives a sufficiently clear representation of this enormous dynamo to render any further description unnecessary.

The feature of the year in incandescent electric lighting was the starting into operation of the first Edison district in New York city. While other inventors have either had no decided conviction as to the best way of supplying incandescent lighting to the consumer, or have not cared to express themselves on the

FIG. 3.

the armatures of present machines, and will secure it the preference in all those cases where an alternating-current machine is desired. The published descriptions of this machine do not indicate the part Mr. Ferranti has taken in its

matter, Mr. Edison, from the outset of his experiments, was convinced that the only practicable method was distribution direct from the machine from large central stations, without the interposition of intermediary apparatus, and

all portions of his entire electrical plant have been designed from this point of view. The system is, in many respects, analogous to that in use with gas. This latter illuminant is distributed from the works through large mains and under low pressure, suitable for direct issuance from the burner. In Mr. Edison's system the current is of low electro-motive force, 110 volts between the terminals of the machine, and is distributed through large mains laid under-ground. The lamps are arranged in what is known as multiple arc, that is, on cross-wires between the house conductors, which themselves form cross-wires to the mains. As the current passing through each lamp depends upon its resistance and the electro-motive force of the current, when this latter is maintained constant, each lamp draws its proper supply without regard to any other on the circuit. The generators at the central station are likewise arranged in multiple arc, one pole of each machine being connected with the outgoing and the other to the return main. The disposition of the machines, and the mode in which the circuits are actually arranged in practice, is shown in the diagram (Fig. 4). Each main consists of an iron tube containing two half-

at L. The large steam-dynamo, of the type used at this station, and which is to be used in all similar installations, is shown in Fig. 5. The magnetic field is produced by twelve horizontal electro-magnets, united at their farther ends by a massive heel-plate, seen at the back of the figure, and terminating in the heavy pole-pieces seen in the front of the illustration. The armature, which is a long cylinder, is composed of a core of a great number of thin sheet-iron disks, insulated from each other and fitting over a central wooden cylinder. The copper is in the form of straight bars instead of wire, in order to make the resistance as low as possible. These bars are united at alternate ends to as many disks of copper, the connection being such that the current passes along one bar, across a disk at one end, along the bar diametrically opposite the first, across a disk at the other end, then along a bar next to the first bar, and so on, the effect being the same as would be obtained by a continuous copper coil of low resistance. The diameter of the complete armature is 28 inches, its length 5 feet, and its weight over four tons. It is driven at a speed of 350 revolutions per minute. Its resistance is only .00049 ohm.

The field coils form a shunt circuit to that of the machine, and have a resistance of 21 ohms. The engine is a horizontal Porter-Allen of 130 horse-power, nominal. The entire machine, including the bed-plate, weighs over thirty tons. It has a normal capacity of 1,200 lamps of 16 candles each, but can supply 1,600 when necessary. There are at present six of these enormous dynamos in place at the central station, but the completed installation will comprise twelve of them.

The current used by each lamp is measured very simply by means of a meter, which consists of

an electrolytic cell through which a small fraction of the current passes. The cell contains sulphate of copper, which is decomposed, and the copper deposited upon one of the electrodes, the amount so deposited being an accurate measure of the current which has gone through. A meter has been designed in which the amount of copper deposited is indicated on a dial, as the gas passing is registered on a gas-meter, but the meter at present supplied to consumers is without registering apparatus, the consumption being determined by the meter-inspector by direct weighing of the electrode. This form of meter is shown in Fig. 6.

FIG. 4.

round copper conductors imbedded in a resinous insulator. A main of this kind is carried around each city block, and each one connected with those of the adjacent blocks through the boxes B, as shown. The conductors in these mains are of uniform size, but by means of the auxiliary mains, termed feeders, shown in the dotted lines, the conducting capacity is increased to any desired extent throughout any portion of the district. The system can by this means be adapted to any increase of consumers as occasion arises. The way in which the dynamos are arranged with regard to the circuit is shown at G, and the mode in which the lamps are connected with the mains shown

FIG. 5

The present working of the station the company regards as in every way satisfactory and fully up to its expectations. When the generators are working up to their normal power, six lamps are obtained per indicated horse-

power. This will not be so when the district is in full operation. Difficulties have been encountered in the working of this station, as was to be expected in a new undertaking of this magnitude, but they have not been of a kind so confidently insisted upon by the opponents of the incandescent light. The lamps burn with perfect steadiness, and the service is reliable, there having been no interruption of the electrical supply since the starting of the station.

The only other possible method of supplying the incandescent light upon a large scale is that involving the use of storage-batteries. By this system storage-cells are placed in the houses of consumers, and charged by a current from dynamos at one or more stations. The advantage of this method over the direct one is the smaller investment in machines and street conductors requisite, as fewer machines, working continuously, can accomplish the work, and as high-tension currents, requiring smaller conductors, can be used for charging. The commercial feasibility of this system depends upon the investment requisite for the necessary storage-batteries, both in the matter of original outlay and depreciation. Very little has as yet been made public, or is, in fact, known on these points, and hence no judgment of the value of this method can at present be formed. This system readily allows of both arc and incandescent lighting being accomplished with one set of street-conductors, which is not feasible with the direct system. The accumulators are charged during the day-time, when the arc-lamps are not burning, and the same current is then used to support the arc-lamps at night. This is the plan which the Brush Company in

FIG. 6.

power; and while, with the installation but partially completed, the number of lamps in use at the time of minimum consumption is below the normal number of one machine,

this country propose to carry out, using for this purpose the storage-battery devised by Mr. Brush, and the Swan incandescent lamp, as indicated above. By means of an automatic device, the batteries are placed in circuit when the electro-motive force falls below a certain point, and cut out again as soon as sufficiently charged. Combined with this is a registering instrument, which indicates upon a dial the current supplied to the battery. The street-wires, for the distance which they enter a house to make connection with the battery, will be thoroughly insulated, and so placed that they can not be handled, so that the danger apprehended from allowing conductors bearing powerful high-tension currents may be thoroughly provided against. The Brush-Swan Company expects to begin putting its system into operation in the course of a few months, and its progress will be watched with great interest, as having an important bearing upon the character of future electric installations.

The other considerable arc-electric lighting company in this country, the "United States," is also proposing to adopt the storage-battery system of incandescent lighting. This company controls the Maxim incandescent lamp, which is being quite largely introduced at various points. In New York no considerable plant has yet been established, but the light is being supplied, to a limited extent, from the arc-lamp stations. It may be remarked here that the Weston arc-lamp, which is furnished by this company, differs from the other arc-lamps now on the market, in using a current of much lower electro-motive force, and nearly twice the volume. The arc is exceedingly short, being not more than one thirty-second of an inch, while that of the Brush is one sixteenth, and the Fuller three sixteenths of an inch. The light of the Weston, on this account, is free from the violet rays noticeable in lamps of longer arc, and is, therefore, more agreeable. The use of a current of such volume requires larger conductors than are necessary with a smaller current, and it can not, therefore, be operated upon long circuits as economically as those of higher electro-motive force.

Various tests have from time to time been made of both arc and incandescent lamps, as well as machines; but the first thorough and complete examination is that made on the apparatus shown at the Paris Exhibition of 1881. Including, as these did, all the chief lamps and machines now before the public, the reports, in which these tests are embodied, are comprehensive and authoritative statements of the commercial value of the present electric-lighting apparatus.

The main committee consisted of MM. Allard, Joubert, T. Le Blanc, Pottier, and H. Tresca. The results obtained by these experts were communicated to the "Académie des Sciences" in four papers bearing the titles:

1. Continuous-current machines and regulators.
2. Alternating-current machines.
3. Electric candles.
4. Incandescent lamps.

Besides this committee, a sub-committee was appointed, specially charged with the examination of incandescent lamps. As the report of this latter committee on incandescent lamps is much fuller than that of the chief one, it is alone reproduced here, and the report of the main committee confined to the first three of the above items.

The unit of power adopted by the committee is the *cheval-vapeur*, which is equal to 75 kilogrammetres, or 542½ foot-pounds per second. This is slightly less than the English horse-power, which is 550 foot-pounds per second.

The luminous intensity is expressed in carcels—equal to 9½ standard candles—and the results of the measurements in various directions are averaged so as to make the intensity the same in every direction, that is, at every point on the surface of a sphere of which the arc is the center. Even when measured in the best direction the results obtained by the committee are much under those stated by the various manufacturers, while the average spherical intensity is very much less. The table on page 274 gives the results with continuous-current machines and regulator lamps.

An examination of this table shows that machines transform on an average 85 per cent of the work expended on them into electrical energy, and of this electrical energy from 50 to 77 per cent appears in the arc, and that for each horse-power of energy expended in the arc there are obtained—

120 carcels, in lights of 800 to 1,000 carcels.	
100 " " " " 250 " "	
71 " " " " 40 " "	

The experiments upon alternating-current machines and lamps were made with the machines of De Meritens and Siemens, and with the Serrin, Berjot and Siemens lamps. In one case a Serrin light-house lamp was operated by a De Meritens machine, giving a light the mean spherical intensity of which was equal to 931 carcels, with an expenditure of mechanical power of 11.7 horse-power. This was equivalent to 79.6 carcels per mechanical horse-power, while but 60 carcels were obtained with lights of the same power operated with continuous currents. The superiority of the alternating current shown in this particular case was not, however, maintained in lights of lower candle-power, as the result fell to 59.7 carcels in the Berjot lamps of 150 carcels (arranged in a series of five), and to 33.3 carcels in the Siemens differential lamps of 39 carcels (12 in three circuits).

The candles examined were those of Debrun, Jablochhoff, and Jamin. The Jablochhoff candle showed from 46 to 51 carcels per arc horse-power, and from 31 to 35 carcels per mechanical horse-power, while that of Debrun, the experi-

ments on which were very incomplete, gave but 32 carrels in the former and 14 in the latter case.

The following is the complete report of the sub-committee on incandescent lamps, with the exception of the detailed statement of the performance of each lamp, which is omitted, as not essential to a full understanding of the results obtained:

**I. DESCRIPTION OF THE LAMPS.**—The only lamps in the exhibition which were purely incandescent in character were those of Edison and Maxim, in the United States Section, and those of Swan and Lane-Fox, in that of Great Britain. The idea represented in these lamps is essentially the same in all of them, the differences being, for the most part, details of construction. They all consist of a glass envelope more or less spherical in form, in which is inclosed a carbon loop, made of carbonized organic material, and supported upon wires of platinum sealed into the glass. The space in the interior of the lamp is very perfectly exhausted.

**A. The Edison Lamp.**—The Edison lamp is pear-shaped in form. The carbon filament is long and fine, and is bent into the shape of a U. It is made from Japanese bamboo, cut to the requisite size in a gauge. In section it is nearly square, being about 0.3 millimetre on a side, the ends being left considerably wider. The fiber is carbonized in molds of nickel, and is attached to the conducting wires by copper, electrolytically deposited upon them.

**B. The Swan Lamp.**—The Swan lamp is globular in form, the neck being quite long. The carbon filament is made from cotton-thread parchmented before carbonization by treatment with strong sulphuric acid. The ends of this filament are very much thickened, and the loop has a double turn at the top. Its ends are clamped in a pair of metal holders, supported laterally by a stem of glass which rises through the neck to the base of the globe. Below, these holders are fastened to wires of platinum which pass through the glass.

**C. The Maxim Lamp.**—The Maxim lamp is also globular in form, but it has a short neck. Within the neck rises a hollow cylinder of glass, supporting upon its summit a column of blue enamel, through which pass the conducting wires of platinum which carry the carbon. The filament is made from card-board cut by a punch into the form of an M. In section, therefore, it is rectangular, and several times as broad as it is thick. It is carbonized in a mold through which a current of coal-gas is passed. After carbonization, the filament is placed in an attenuated atmosphere of hydrocarbon-vapor and heated by the current. The vapor is decomposed, and its carbon is precipitated upon the filament. In this way not only are inequalities obliterated, but the resistance of the filaments may be equalized, and brought to any standard required.

**D. The Lane-Fox Lamp.**—The Lane-Fox lamp is ovoid in shape, the neck being in length

intermediate between the two lamps last described. The carbon is in the form of a horse-shoe, and is circular in cross-section. It is made from the root of an Italian grass, largely used in France for making brooms. After carbonization, the filaments are classified according to their resistances. They are then heated in an atmosphere of coal-gas, by which carbon is deposited upon them, as in the filaments of the lamps last described. The filament in the lamp is supported by platinum wires, to which it is attached by sleeves of carbon encircling both. These wires pass through tubes in the top of a hollow glass stem. Just below the extremities of these tubes are two small bulbs containing mercury, forming the contact between the platinum wire sealed into the glass above and the copper conductor which enters from below. These conductors are held in place by plaster which fills the base of the lamp.

**II. METHODS OF MEASUREMENT.**—The question to be determined was simply the efficiency of these lamps. The efficiency of a lamp is the ratio of energy produced to energy consumed, i. e., the quantity of light given by the lamp for each horse-power of current which it consumes. The data required to calculate this efficiency may be obtained when the electromotive force of the current, the resistance of the lamp when giving its light, and its illuminating power have been determined.

**1. Electro-motive Force.**—The electro-motive force, or fall of potential through the lamp, was measured by Laws's method. A suitable condenser was charged by being put in communication with a standard Daniell cell, and then discharged through a high-resistance galvanometer, the deflection of the needle being noted. This condenser was then connected to the two wires of the lamp, and again discharged through the galvanometer, the deflection being made the same as before by means of a variable shunt connected with the galvanometer. Since with a given condenser the charges it receives are proportional to the potentials of the charging currents, and since the discharge deflections of a galvanometer represent the quantity of these charges, it follows that the electro-motive forces are proportional to these discharge deflections. If, however, as in the present case, the discharge deflections are made equal by means of shunts, then the electro-motive forces are proportional to the multiplying power of the shunts.

**2. Resistance.**—The resistance of the lamp, when giving its light, was obtained by making the lamp one side of a Wheatstone's bridge through which the main current was flowing. The second and fourth sides were formed of fixed resistances of known value, and the third side of an adjustable resistance. When the bridge is balanced, the product of the two fixed resistances, divided by the adjusted resistance, gives the resistance of the lamp at the given candle-power.

3. *Illuminating Power*.—The illuminating power of the lamp was measured on a Bunsen photometer. At one end of the bar was the lamp itself; at the other end two standard candles, placed nearly in line. The plane of the carbon filament was placed at  $45^\circ$  to the length of the bar, and each lamp was measured at 16 and 32 candles.

III. APPARATUS EMPLOYED. 1. *Condenser*.—The condenser used in these measurements had a capacity of 1 microfarad, divided into sections of 0.4, 0.3, 0.2, and 0.1. The dielectric was paraffined mica, and the brass-work was supported on ebonite pillars.

2. *Galvanometer*.—The galvanometer was a Thomson double-coil astatic instrument, inclosed in a square case with glass sides. Measured resistance, 6,550 ohms. Used with lamp-stand and scale, in the ordinary way.

3. *Standard Cell*.—An ordinary Daniell cell, the copper plate being immersed in a saturated solution of pure copper sulphate, contained in the porous cell, and the zinc plate amalgamated, in a saturated solution of pure zinc sulphate, in the outer jar; one of a battery of ten cells forming a part of the Edison exhibit.

4. *Resistance Coils*.—A set of standard coils, measuring from 1 ohm to 5,000 ohms. All other resistances employed were standardized by these. A set of coils used in the Wheatstone's bridge. Compared carefully with set.

5. *Wheatstone's Bridge*.—Four conducting wires of large size arranged on the table in the form of a rhomb. A test galvanometer was inserted between the obtuse angles of the rhomb, and a pair of shunt wires from the main conductors were attached at the acute angles. The first side of the rhomb contained the lamp to be measured, standing in its place on the photometer. The second side contained a fixed resistance of 5 ohms. The third side contained a variable resistance, and the fourth side a fixed resistance of 950 ohms.

6. *Photometer*.—The photometer employed was of the Bunsen form, having a double bar, eighty inches long, graduated in inches and in candles. The disk was of paraffined paper, with a plain spot in the center. The disk-box was movable on rollers, and contained inclined mirrors to facilitate the adjustment. The candles used were of spermaceti, made to burn 120 grains (7.776 grammes) per hour. The entire apparatus was surrounded with heavy black cloth.

7. *Dynamo-electric Machine*.—An Edison sixty-light machine was used to furnish the current required. In this machine the field-magnets, which are very long and heavy, stand vertically. The field is maintained by a shunt current, regulated by an adjustable resistance in its circuit. The bobbin is wound on a cylinder like that of Siemens, from which it differs, however, in its details. Its resistance was only 0.03 ohm, and the current delivered, at a speed of 900 revolutions, had an electro-motive force of 110 volts.

IV. RESISTANCE OF LAMPS COLD.—The resistance of the lamps cold was measured on a Wheatstone's bridge of the ordinary form and in the usual way. Twenty-four of each were taken (except the Lane-Fox, of which only fifteen were furnished), and ten selected from these for the tests.

V. METHODS OF CALCULATION. 1. *Illuminating Power*.—The standard candle should burn 7.776 grammes spermaceti per hour, or 0.1296 gramme per minute. The two candles used should burn 0.2592 gramme per minute. The corrected candle-power of the lamp, therefore, is obtained by the proportion: As 0.2592 is to the amount actually burned per minute, so is the observed candle-power to the corrected candle-power.

2. *Resistance (hot)*.—From the theory of the Wheatstone bridge, the resistance of either side is equal to the product of the adjacent sides divided by the opposite side. In the bridge used for the measurement, the resistances in the two adjacent sides were 950 and 5 ohms. Hence, by dividing their product, 4,750, by the reading of the variable resistance observed, the resistance of the lamp hot is obtained.

3. *Electro-motive Force*.—In Laws's method the electro-motive forces are proportional to the multiplying power of the shunts employed. Since with the Daniell cell no shunt was used, the multiplying power of the shunt used with the lamp-current represented directly the electro-motive force through the lamp, in terms of the standard cell. The multiplying power of a shunt is the sum of the galvanometer resistance and the shunt resistance divided by the shunt resistance. In this case the resistance of the galvanometer was 6,550 ohms. Hence, if  $S$  represent the resistance of the shunt, obtained by experiment—

$$\frac{6550 + S}{S}$$

will represent the electro-motive force. Since the electro-motive force of a Daniell cell is not 1 volt, as here assumed, but 1.079 volt, strict accuracy would require the figures given to be increased in that ratio. Moreover, the small error arising from the inductive action of the needle on the galvanometer coils has been regarded as unimportant.

4. *Current*.—By the law of Ohm the current strength is the quotient of electro-motive force by resistance. Dividing the electro-motive force in volts by the resistance in ohms, the current strength is obtained in amperes.

5. *Electrical Energy*.—The work done by a current is proportional to the product of the square of the current strength into the resistance of the circuit. Or, since the electro-motive force is equal to the product of the current strength by the resistance, the energy is represented by the product of the electro-motive force in volts by the current strength in amperes. This gives the energy in volt-amperes.

6. *Mechanical Energy.*—Since an absolute unit of work is done per second by an absolute unit of electro-motive force in a circuit of one absolute unit of resistance, 1 volt-ampère represents 10<sup>7</sup> absolute units of mechanical work per second, or 0.10192 kilogramme-metres. By multiplying the volt-ampères by 0.10192, the product is the mechanical work done in the lamp in kilogramme-metres.

7. *Lamps per Horse-power of Current.\**—One horse-power is 75 kilogramme-metres per second. By dividing 75, therefore, by the number of kilogramme-metres of work done in the lamp per second, the quotient is the number of such lamps maintained by a horse-power of current.

8. *Candles per Horse-power of Current.*—The number of candle-lights per horse-power of current is obtained, of course, by multiplying the number of lamps per horse-power of current by the corrected candle-power of each.

9. *Normal Lamps per Horse-power of Current.*—Conversely, by dividing the number of candles per horse-power of current by the normal value of the lamp in standard candles (in the present case 16 or 32), the number of normal lamps per horse-power of current is obtained.

VI. CONCLUSIONS.—The following conclusions seem to be sustained by the results which have now been given:

1. The maximum efficiency of incandescent lamps in the present state of the subject, and within the experimental limits of this investigation, can not be assumed to exceed 300 candle-lights per horse-power of current.

\* This is the French horse-power, *cheval-vapeur* = 542½ foot-pounds per second, as stated above, instead of 550 foot-pounds.

2. The economy of all lamps of this kind is greater at high than at low incandescence.

3. The economy of light-production is greater in high-resistance lamps than in those of low resistance, thus agreeing with the economy of distribution.

4. The relative efficiency of the four lamps examined, expressed in carcel-burners of 7.4 spermaceti-candles each, produced by one horse-power of current, is as follows: (A.) At 16 candles: Edison, 26.5; Swan, 24; Lane-Fox, 23.5; and Maxim, 20.4. (B.) At 32 candles: Edison, 41.5; Lane-Fox, 37.4; Swan, 35.5; and Maxim, 32.4. To double the light given by these lamps the current-energy was increased, for the Maxim and Lane-Fox lamps, 26 per cent; for the Edison lamp, 28 per cent; and for the Swan lamp, 37 per cent.

EMERSON, RALPH WALDO. Born in Boston, Mass., May 25, 1803. His father, William Emerson, was pastor of the First (Unitarian) Church in that city, and his grandfather also was a preacher. In his eighth year, on the death of his father, he was sent to the Grammar School, and was fitted for college at the Boston Latin School. He entered Harvard College in 1817, in his fourteenth year, and was graduated in 1821, having had among his instructors Edward Everett, George Ticknor, and Caleb Cushing. He was not at all distinguished as a student, though he succeeded in carrying off prizes for dissertations and declamation, and was noted as a frequenter of the library and for knowledge of general literature. He was also the poet of his class on "class-day." The five years following his graduation were spent in teaching school.

As it was expected that Emerson should follow the family tendency to preaching, he studied divinity, chiefly under Channing, and was "approved to preach," in 1826, by the Middlesex Association of Ministers; but, owing to general debility, he did not enter upon public work for some time. In March, 1829, he was ordained as colleague of Henry Ware, at the Second (Unitarian) Church of Boston, and in a year's time became sole pastor. This kind of labor, however, does not appear to have been quite congenial, and as his peculiar cast of mind led him to entertain and express grave doubts as to the sacrament of the Lord's Supper being a permanent institution, or of any value to any one in these latter days, he first brought the subject before his congregation, and urged substitution of some other rite of commemoration; and when the people to a man refused to adopt his views, he quietly resigned, in 1832, and retired from any further connection with public preaching. Thenceforward he turned his attention largely to giving lectures, and writing in both poetry and prose. He traveled in Italy, France, and England, for a year. While in England he visited Wordsworth, Coleridge, and Carlyle, with the last of whom he formed a close friendship, despite Carlyle's cynicism and fixed habit of abusing his fellow-men, which was in marked

contrast with his own tolerant and fair-minded temper.

On Emerson's return home, in the winter of 1833-'34, he began his career as a public lecturer in the Boston Mechanics' Institute, taking "Water" as his first subject. Three others followed, two on Italy, and the last on "The Relation of Man to the Globe." In 1834 he delivered a series of biographical lectures on Michael Angelo, Milton, Luther, George Fox, and Burke, the first two of which were afterwards published in the "North American Review." In the same year, also, he read a poem at Cambridge before the Phi Beta Kappa Society. The year following he was married for the second time—his first wife having died, of consumption, in 1832—and took up his residence in the "Old Manse," in the quiet little village of Concord, twenty miles from Boston, where he had his home until his death.

From this time onward, for some thirty to forty years, Emerson continued to give courses of lectures, year after year, on such topics as "English History," "The Philosophy of History," "Human Culture," "Human Life," "The Present Age," "The Times," etc. These lectures were delivered in all parts of the United States, and he always secured good attendance. In 1848, on a second visit to Europe, he lectured in England and Scotland. He was well received, and had large audiences; but how much of his reputation grew out of his peculiar way of presenting and discussing important subjects, it is not easy to say. One further visit was made to the Old World in 1872, when he was accompanied by his daughter, and renewed the intercourse of twenty years before with Carlyle and other friends and admirers in England. Subsequent to this there are few events in Emerson's life on record. On March 30, 1878, he spoke in the Old South Church on "The Fortune of the Republic," and in 1880 gave his hundredth lecture before the Concord Lyceum, on "New England Life and Letters."

Emerson died at his residence, in Concord, on the evening of April 27, 1882, without a stain upon his character as a man and a citizen, and esteemed by all his neighbors, and those who knew him best in these relations. In other respects, however, looked at as a philosopher, a guide, a poet, it is somewhat difficult to estimate aright his true position and rank. Some are as extravagant in laudation as others are in contempt and scorn. One set of men exclaim that there never was, and never will be again, such a philosopher, such a writer, such a poet, such a sage, before whose transcendent brilliancy and profundity all the fires of ancient and modern wise men and teachers pale into almost nothingness. Another set, angered at the difficulty of finding any sense or meaning in many of his writings, cast them all aside as little better than gibberish—as words, words, without being anything else; as a profundity of nonsense and supposed wis-

dom, without any reality. Doubtless both extremes are to be avoided, and a fairer estimate sought somewhere between them. The Boston "Transcendental Club," of which Emerson was a member, in company with George Ripley, Theodore Parker, Margaret Fuller, and other kindred spirits, set out to do great things through its organ, "The Dial," and its remarkable attempt to carry out a fantastic theory of living together, in the "Brook Farm" community (1841). Emerson was a chief contributor, and for most of the four years of its existence editor, of "The Dial"; but he had common sense enough to see that æsthetic villages were not among the possibilities for the human family. Emerson's aim in the journal just named, as, indeed, in all his lectures and writings, was to be a teacher of his fellow-men; and it may be regarded as certain that he has largely influenced the minds of a select, appreciative few. He possessed imagination, wit, and a keen sense of beauty; but his style of writing and expressing himself is by no means always clear and pleasing. In his poetry, though he sometimes fully vindicates his claim to be a true bard, he is frequently as inartistic and harsh as the merest pretender to the divine faculty. There are many who doubt altogether the value of New England transcendentalism, and these will probably never be brought to acknowledge any special merit in Emerson or his writings. Others, whose proclivities lie in that direction, will, on the contrary, turn to the Sage of Concord, and will diligently study and feed upon the pabulum which Emerson's contributions to both poetry and prose afford. Possibly Emerson will be a power in the future, as in the past, and his admirers confidently predict that his fame will endure while the world lasts.

The works of Ralph Waldo Emerson are published by Houghton, Mifflin & Co. in various editions. The "Fireside Edition," in five volumes, 16mo, is a very neat and commodious one (1883). Vol. I contains the "Essays," first and second series (1841-'44). Vol. II contains "Representative Men," being essays on Plato, Shakespeare, Goethe, and others (1850), and "Society and Solitude" (1870). Vol. III contains "English Traits," being studies of English life and character (1856), and "The Conduct of Life" (1860). Vol. IV contains "Letters and Social Aims" (1876), and "Poems" (1876), being his last revision and selection of his poetical works. Vol. V contains "Miscellanies, embracing Nature, Addresses, and Lectures" (1836-'44). To these is to be added "Parnassus," a volume of "Choice Poems, selected from the Whole Range of English Literature, edited by Ralph Waldo Emerson, with a Prefatory Essay."

ENGINEERING. The year 1882 saw the final completion of the St. Gothard Tunnel, a work of engineering so important as to mark an epoch in the progress of civilization, but which the narrow jealousies and chicaneries of

European diplomacy delayed for twenty years. The same year witnessed the indefinite postponement, from political motives equally false and retrograde, of another work of even bolder design, and of scarcely less importance to civilization, which engineering art stands ready to execute. (See ENGLISH CHANNEL TUNNEL PANIC.)

Among the ship-canals under discussion are one from Bordeaux to Narbonne to join the Atlantic and Mediterranean, one to connect the North Sea and the Baltic, the Nicaragua maritime canal, one through the Isthmus of Kraw, and the recently projected Manchester ship-canal. The protests of De Lesseps against the violation of the Suez Canal by the British army led to the discussion of a new canal between the Mediterranean and the Red Sea. As the concession to the Suez Company conveys the exclusive right to the isthmus route, the construction of a ship-canal from Alexandria to Suez by way of Cairo was proposed. The Suez Canal is insufficient for the present traffic, and will have to be enlarged if a second canal is not constructed. The proposed canal through the Delta would be of great value to the irrigation system of Egypt, as it would be a sweet-water canal, fed from the Nile. The quantity of material to be excavated would be about 160,000,000 cubic yards, or double the quantity removed in the construction of the Suez Canal. The drainage-canals constructed by Ismail Pasha in the first ten years of his reign involved an equal amount of excavation. To efficiently irrigate the lands of the Delta it is found that about an average of seven tons of water per day are required for every acre. This, for the total area of 3,000,000 acres, would call for a constant supply of 250 tons per second, which is five sixths of the discharge of the river at lowest Nile. The Menoufieh and the Behera Canals are capacious enough to convey the whole quantity of water needed, but they carry off together not more than seventeen tons of water per second when the river is at its lowest stage. The present drainage system is constructed so as to keep the water stored in reservoirs formed by sluices in the canals. The removal of the sediment which settles in these reservoirs involves an enormous amount of labor. The proposed canal to Cairo and Suez would be able to supply the entire 250 tons per second without interfering with its function as a ship-canal. Half the surface of the Delta could be directly irrigated from the canal, and the other half, comprising the lands between the Rosetta and Damietta branches, could be supplied by means of large siphons or by reconstructing the *barage* of Mehemet Ali.

The final surveys for the Panama Canal have been completed, and the work is advancing at Colon, Gorgona, Bas-Obispo, Emperador, Cu-lebra, and Paraiso. Very heavy dredgers have been brought from Philadelphia, and a large quantity of other machinery will be employed.

As the work progresses the belief is confirmed that less rock excavation will be necessary than was calculated.

Rapid progress has been made on the Isthmus of Corinth Canal. The material to be excavated is alluvial earth, so that about 800,000 cubic yards can be removed per month by the aid of the Priestman excavating machine and with dredgers. The total amount of excavation to be done is estimated at 13,000,000 cubic yards, 1,000,000 of which is dredging, 1,700,000 mixed earth and rock, and 1,000,000 rock below water.

The important Sirhind drainage-canal in the Punjab, in British India, was completed within the year. The canal is 500 miles in length. It has subsidiary trenches of about 5,000 miles in aggregate length. It draws its water from the Sutlej, and distributes it over 750,000 acres of land.

The docks at Milford Haven, in South Wales, are nearly completed. A fleet of fast mail-steamships has been projected in the United States, which will make the voyage from New York to Milford in six days, and there connect with a special train to London, on the Great Western Railway. Milford Haven is the finest natural harbor in England, being the largest, the most sheltered, and the easiest of access; yet, since it was deserted by the Royal Navy-Yard and the Irish Steamship Line, it has had no commerce until it was taken hold of by the company which has been improving its harbor facilities and railroad connections for the last six or seven years. Vessels need no pilot, as the entrance is nearly two miles wide. The harbor is virtually landlocked, and has a minimum depth of eight fathoms. The new docks have an area of sixty acres. The entrance-lock is 500 feet long by 70 wide. The graving dock, which can also be used as a wet dock, is 710 feet in length and 96 in width. There is a small graving dock 270 by 46 feet. The depth over the sills at high water in the spring-tide is 36 feet, in the neap-tide 27 feet. The docks were made by closing the mouth of a creek with a wall and caissons, and dredging out the inclosed area. There are two locks to the dock, so that a vessel can be put upon the dry dock immediately upon coming in from sea. Both ends of the great dock and the entrance to the graving dock are closed by caissons of novel design. The end of the graving dock which opens into the wet dock, is shut by a floating caisson of the common type. The new caissons rise, when the water is removed from the flotation chambers, about nine inches above the floor between the sills, and pass into lateral chambers, their motion being controlled by a valve which closes a culvert, and by rollers on top running on girders extended over the receiving chambers. The weights of the lock are 250 tons, and those of the graving dock 300 and 400 tons respectively. To remove the salt water from the large caisson which was used in putting in the sill of the graving dock at every

ebb-tide, seven powerful pulsometer pumps were employed. The length of the quay is 2,283 yards. Coal can be obtained at Milford 30 per cent cheaper than at Liverpool.

The preliminary surveys for the proposed reclamation of the Zuyder Zee have been finished. A dike about twenty-four and a half miles in length will be constructed of sand and faced with clay, reaching sixteen feet above the level of the sea, or about six and a half feet above the highest tide. The thickness of the dike will enable it to resist the heaviest seas. The calculation is to have it completed in from seven to ten years, at a cost of \$46,000,000.

The Belgian Government and the municipality of Antwerp have arranged for a considerable enlargement of the harbor, to meet the demands of the increasing commerce of that port. The excellence of the facilities for transshipment gives this port the advantage over all others on the west coast of the Continent. The harbor has always a depth of twenty-five feet of water. Its connection with internal navigation and with the railroad lines, over which it enjoys favorable tariffs, and the absence of vexatious formalities, have drawn to Antwerp a commerce which now reaches 5,600,000 tons a year. Since the opening of the St. Gothard Railway it commands the great freight movement between the North Sea and the Mediterranean. The harbor consisted already of seven basins, with a total area of one hundred acres, and two and a half miles of quays. The new works consist in the widening and deepening of the channel of the river Escaut and the construction of an additional basin. The contracts were awarded to Couvreux and Hersent. Their amount is 38,000,000 francs. The river will be dredged to a uniform depth of twenty-five feet and a width of three hundred and eighty-two yards. A quay is being extended along the entire river front of the city, two and a half miles, one eighth of which only was already built. The sea-wall of the mole is continued in a dike above, to conserve the rectified channel. The new basin is ten acres in area, and gives six thousand feet of wharfage. The great wall, built on foundations sunk from eight to sixteen feet, is thirty feet broad at the base, one tenth narrower at the top, and of an average height of forty-eight feet. Caissons are sunk for the foundations. They are about eighty feet in length. To the top of the caisson a movable iron bell, of the same form, and some forty-five feet high, is fitted, within which the masonry is built up to the surface of the water. The bell, which weighs about two hundred tons, is floated into position, hung in a scaffolding supported by two barges. It is lowered by a system of jack-screws, very delicately adjusted, which are actuated by a steam-engine. The same engine works the pumps which fill the caisson with compressed air, and furnishes power also for bringing the materials and the mortar on cranes into the bell. The iron bell

is first floated to the spot when a fresh section of the wall is to be constructed. The bottom is a couple of feet above the level of the water. When the pontoons are firmly anchored, the caisson is floated under the bell and fitted to it, the joint being closed with India-rubber. A layer of *béton* is laid on top of the caisson, and the masonry is commenced on this. When the caisson touches ground at low tide, it is allowed to sink into place by withdrawing the pressure. If it does not settle squarely, men descend into the air-chamber, and excavate from the river-bottom until it assumes an upright position. When the caisson is enough charged to prevent its swaying at high tide, the water and silt are again removed from the working-chamber. *Béton* is poured into the chamber through four wells furnished with air-locks. When the masonry is carried up to the level of the water, the four flumes are withdrawn with the bell, and the holes are filled in with *béton*. The mole is one hundred yards from the former bank, and the space between is filled in with earth.

The St. Gothard Tunnel was opened to traffic in May. It was the most costly of the Alpine tunnels (see ALPS, TUNNELS OF THE), the cost of construction having amounted altogether to 227,000,000 francs, or \$44,000,000. It is, however, the straightest and shortest route over the Alps, and must receive the commerce of the whole Rhine Valley and all the adjacent region of Western Germany, of a large section of Eastern France and of the ports of Holland and Belgium, and the Mediterranean trade of the North of Europe. It will make Genoa an outpost for German commerce in the Mediterranean in the same manner as the Brenner and Semmering Railroads made Venice and Trieste German ports on the Adriatic. This, the most important of the five Alpine railroad routes, would have been completed long before, if international jealousies and the rivalries of the Swiss cantons had not stood in the way. The road was talked about before 1848, but it was only after the consolidation of Italy and the establishment of the North German Bund that the interests of those two nations prompted them to take up the scheme in earnest. There was a conference held at Bern in 1869, in which Switzerland, the North German League, Italy, Baden, and Württemberg took part. The rival interests of Austria could be disregarded after her defeat at Sadowa, but the French Emperor would have forbidden the construction of a line which would break up the monopoly of the Mont Cenis route if a more convenient pretext for the war with Germany had not presented itself. The Swiss cantons were brought to the verge of civil war by disputes over their rival claims. Bismarck overcame their dissensions and the French and Austrian opposition, while Cavour pledged Italy to the payment of more than half the cost. Within ten years after the work was commenced the railroad was in operation. The Semmering and Bren-

nor roads cross the chain at comparatively low altitudes and their tunnels are much shorter. The fifteen tunnels of the Semmering aggregate together 4,469 metres, and of the twenty-seven tunnels of the Brenner, the largest is only 885 metres. The Mont Cenis Tunnel is 12,233 metres. The St. Gothard Tunnel is 14,944 metres in length, and besides the main tunnel there are fifty-three others, making altogether 40,718 metres of tunneling.

The French, as stated in another place, are considering the project of a new railroad connection with Italy, either through the Simplon, Mont Blanc, or Little St. Bernard, in order to retain the through French traffic which the St. Gothard Railroad threatens to take away. The Government engineers reported in favor of the Mont Blanc route, the ground of their preference being that the mouth of the tunnel would be in French territory, while by the Simplon route it would be necessary to use Swiss railways for 127 miles, and that it would preserve to Marseilles its Swiss trade, which would otherwise go to Genoa. The Simplon route does not present the same engineering difficulties as Mont Blanc, but still it would require sixty miles of mountain railway and a tunnel twelve and a half miles long, exceeding by more than three miles the great St. Gothard Tunnel. The highest elevation would be 2,205 feet, which is much lower than that of the St. Gothard (3,693 feet), the Mont Cenis (4,043), or the Arlberg Tunnel (4,102); but the difficulty of cooling the tunnel would be so much the greater. The temperature in the St. Gothard Tunnel is 31° Centigrade, and under the Simplon would be three or four degrees hotter. Calculations as to the temperature of the projected tunnel under Mont Blanc indicate a temperature of 55° Centigrade for the distance of two miles, but there are better facilities for ventilation than in the St. Gothard Tunnel, since, for the distance of about three miles, ventilation-shafts 640 feet deep will connect it with the outer air. The Mont Blanc railway would involve the outlay of about 179,000,000 francs, and the one over the Simplon would cost 145,000,000 francs.

The Arlberg Tunnel, to connect Switzerland with the Austrian railway system, which was begun in June, 1880, will be 6.382 miles long. The summit-level, 4,998 feet above the Adriatic, is 2.611 miles from the eastern extremity. The Ferroux machine, which was employed in the St. Gothard Tunnel, is used at the eastern end, and the Brandt machine, which was tried with good results in the St. Gothard works, is employed at the other end. The latter was guaranteed by the inventor to advance six feet four inches a day. Its performance greatly exceeds the guarantee. It drills by boring, and is moved by water under pressure, while the Ferroux perforator acts by percussion and is propelled by compressed air. The comparison of the two, working under identical conditions, will enable engineers to determine which is the

preferable system. The ventilation of the Arlberg works will be accomplished by a separate apparatus, distributing air under low pressure through pipes at the point where the work is going on.

With the ingenious machine of Colonel Beaumont a gallery seven feet in diameter has been driven for the distance of over a mile and a quarter from the English shore in the gray chalk underneath the English Channel. The Beaumont perforator consists of a powerful bar of iron rotated about its center, with seven short teeth or knives of steel on each arm which scratch away the chalk from the face of the heading. At each turn of the bar the machine is impelled forward on a horizontal axis through a distance of seven millimetres, or about a quarter of an inch. The heading driven by the perforator is 2.14 metres in diameter and perfectly cylindrical. The axle on which the bar that carries the knives rotates is a powerful bar of steel. The rotary movement is given to it by means of a system of cog-wheels which successively reduce the speed originally imparted by compressed air to the actuating crank and communicated to the cog-wheels by a pair of friction cylinders. The horizontal movements of the machine are produced by a hydraulic apparatus, and are controlled by valves which allow the machine to be moved forward or backward, or to remain on one spot. When the machine has advanced by hydraulic pressure through a distance of 6½ feet, the machine is lifted off its bed by a combination of levers, and the hydraulic pressure is applied to the bed of the machine, moving it forward another stage. The rock is very finely divided by the knives of the perforator. The fragments fall to the floor of the gallery, and are gathered up by large scrapers and conveyed to cars at the back of the machine by buckets attached to an endless chain. The crank-axle makes 100 revolutions a minute, with a pneumatic pressure of two atmospheres, or 45 pounds to the square inch. The actual progress of the machine on the English side averaged 60 centimetres an hour and 15 metres a day. A more powerful machine is used on the French side, which accomplishes one metre an hour.

The execution of the New York Tunnel in the soft, silty bed of the Hudson River, between Jersey City and New York, is still problematical, as the works have stopped for the second time. The erroneous idea that compressed air would act as a support instead of timbering resulted in the distressing accident by which a number of men lost their lives a short time after the tunnel was begun. After that a permanent bulk-head of masonry was constructed near the shaft, containing an air-lock, consisting of an iron tube large enough for the admission of a man. The ingenious plan on which the tunnel is constructed has been before described. The plate-iron shell, within which the arched masonry is built, has

a movable bulk-head at the end. The shell is of boiler-iron, in sections 15 feet long. One plate of the temporary boiler-plate bulk-head is removed and the earth dug away from behind it. A second plate is in like manner taken out, if no difficulty has been experienced. Then a segment of the sheet-iron shell is bolted on to the completed part. The air-pressure, employed to keep out water, is 26 pounds to the square inch. When there is an escape of air, dry cement is applied to the hole and is carried in by the current until the hole is stopped. In the case of larger leaks much ingenuity is required, as also in getting in the shell-plates.

The Severn Tunnel, which will carry the Great Western Railway into the heart of the coal and iron district of South Wales, will probably be completed in 1884, 7,000 feet having been dug and arched at the close of the year. Since the irruption of water from a land spring, which seriously delayed the works, no similar mishap has occurred. The work progresses at the rate of 500 feet a month. With 20 pumps of various capacities, only half of which are operated continuously, nearly 12,000,000 gallons of water are raised *per diem*. The tunnel will be  $4\frac{1}{2}$  miles in length,  $2\frac{1}{2}$  miles under the Severn and 2 miles under the land. The strata under the river have been found sound and dry latterly. More water enters in the land-sections. The brick-work is made of vitrified brick set in Portland cement. There are 3,000 men employed and 14,000 pounds of explosives are used monthly. The tunnel passes through red sandstone under the river and hard pennant under the Gloucestershire shore. The minimum thickness of the roof, between the tunnel and the river-bed, is 40 feet, and the depth of the tunnel below high water 163 feet.

The shorter tunnel, which is being bored under the Mersey, resembles the other in being excavated in red sandstone. It is three fourths of a mile in length. The floor is 144 feet below high water. As in the Severn works, an enormous quantity of water has to be pumped out. The machine devised by Colonel Beaumont, for excavating the Channel Tunnel, has been adopted. It is expected to advance the driftway 30 yards per week.

The construction of the Brooklyn Bridge was first begun January 2, 1870. In 1877 the making of the cables was commenced, and in 1882 the approaches were nearly completed, and work begun on the superstructure. The caissons for the towers were 172 by 102 feet on the New York, and 168 by 102 feet on the Brooklyn side. The New York caisson weighed 7,000 tons, and the concrete filling 8,000 tons. The tower on the New York side contains 46,945 cubic yards of masonry, the Brooklyn tower 38,214 yards. The span over the river is 1,595 $\frac{1}{2}$  feet. The land-spans are each 930 feet long. The Brooklyn approach is 971, and the New York approach 1,562 $\frac{1}{2}$  feet. The total

length of the bridge is 5,989 feet. The sustaining cables, four in number, are 15 $\frac{1}{2}$  feet in diameter, and will each stand a strain of 12,200 tons. The wire which composes them is 12 feet to the pound. There are 5,296 wires in each cable. They are of galvanized steel and oil-coated. Each wire is 3,578 $\frac{1}{2}$  feet long. The wires are not twisted, but closely wrapped to form a solid cylinder. The tower on the Brooklyn side is laid on a foundation 45 feet below high water, while the New York tower rests on a foundation sunk 78 feet below the high-tide mark. The towers have each a section at the high-water line of 140 by 59 feet. At the roof-course they are 136 by 53 feet. The height of the towers above high water is 278 feet. The clear height of the bridge above high water in the center of the river is 135 feet at 90° Fahr. The height of the floor at the towers is 119 feet at high water. The top of the towers is 159 feet above the roadway. The anchorages are in masses of masonry 129 by 119 feet at the base, and 89 feet high at the front, and 85 feet at the rear. At the top they are 117 by 104 feet. The anchor-plates weigh 23 tons. The depots at the ends of the bridge will be of glass and iron, the one on the New York side 260 feet long and 59 feet wide. The cars will be propelled by stationary engines and wire-traction ropes.

Besides the great suspension-bridge at New York, a second bridge over the East River has been commenced farther up. It is to cross in two suspended spans from Ravenswood, Long Island, to the upper part of Blackwell's Island, and from Blackwell's Island to the New York shore. The bridge, with its approaches of iron trestle-work, will be 10,043 feet long. The suspension spans will be respectively 734 and 618 feet in length, and will have a clear height above the water at mean tide of 154 feet. There will be three chain-cables strung over iron towers, and holding up the iron trusses which support the floor of the bridge. The roadway will be 76 feet wide, giving room for double railroad-tracks, carriage-roads, and sidewalks. The towers will be formed by twelve wrought-iron columns of 2 $\frac{1}{2}$ -inch iron about 24 inches in diameter, braced in every direction. Each of the four towers will be 46 feet long at the top, 100 feet long at the base, and 260 feet high. The towers rest upon masonry piers 60 feet wide and 120 feet long. The cables, one on each side and one in the middle, will be double, consisting each of two chain-cables, one above the other, crossing each other in the center of the bridge on a pin-joint, and joining each other by symmetrical curves. The two cables are braced together with diagonal braces and divide the load between them. The natural advantages of the location are unequaled. At each abutment solid rock is found a short distance below the surface. The anchorage on Long Island and in New York will be in 40 feet of natural rock, and on Blackwell's Island it will be in 12 feet of rock re-en-

forced by 40 feet of masonry. The total cost is estimated at \$6,000,000.

A railroad-bridge has been erected across the Kinzua Valley, in Pennsylvania, for the New York, Lake Erie, and Western road, which is the loftiest structure of the kind in the world, and so light that it appears as if made of wire. The highest pier is 297 feet in height, the average height being 176 feet. It crosses the Kinzua Creek at an elevation of 2,100 feet above the sea. Engineers have for several years studied the best way to cross this deep ravine, which lies in the way of a railroad between Pittsburg and Buffalo. The gigantic viaduct which has been constructed was planned by O. W. Barnes. Its length is 2,051 feet from abutment to abutment. The height of the rail-level above the bed of the small stream in the center of this chasm is 301 feet. There are twenty spans of 61, and one of 62 feet. The width of each tower is  $38\frac{1}{2}$  feet at top. The truss is 6 feet high and 10 wide. It is continuous. The braced columns which form the piers are one foot in diameter. They incline with a batter of two inches in a foot. Each column rests on a base of masonry. The iron shoes to which the columns are fastened are imbedded in the copings of the piers, and each one is anchored by two large bolts passing through the pier and fastened to iron plates at the bottom. These bolts are designed to add to the security against windstrains. Four million pounds of iron and seven thousand cubic yards of masonry were used in the construction of the viaduct. The foundations are mostly in solid rock, but for a few piers near the bottom they are on piles.

The new bridge designed by the English engineers, Fowler and Baker, to cross the Forth, which will be the widest-span bridge in the world, is of a new type, and will be the first bridge built of steel. The principle of the design is to have enormous balanced cantilevers on two river-piers, and the space between them in the middle span, bridged by a long lattice girder, carried from the end of one cantilever to the other. The steel employed will be tested for a tensile strength of 30 to 33 tons to the square inch, with 20 per cent elongation, and for a resistance on compression of from 34 to 37 tons, with 17 per cent elongation. There are two spans bridged in the way described. The piers holding the cantilevers are iron frames, resting on foundations of rock and hard clay, each 350 feet high. The length of the central pier is 270 feet, that of the two others 150 feet. The spans are each 1,700 feet. The balanced cantilevers, or brackets, are about 675 feet long each. They are fastened at top and bottom to the iron frames of the piers. The two projecting brackets bridge about 1,350 feet of the space between the piers. The remaining 350 feet are closed by a lattice girder, resting on the tips of the cantilevers. The weight of each bracket is about 3,360 tons. A suspension-bridge over the Forth was commenced, but the

work was abandoned when the Tay Bridge disaster had awakened the minds of engineers to the magnitude of the wind-strains which such structures must undergo. The present design was intended to attain exceptional strength and rigidity, and to stand heavy freight and fast passenger traffic, as well as the heaviest gales which sweep the Scotch coast.

The new Eddystone Light-house was set in operation on May 18th. The tower was designed by James N. Douglas, Chief-Engineer to the Trinity Corporation, which has charge of the British light-house system. It is as solidly constructed as the old tower, and firmer than if hewed out of a single block of granite, for the separate stones are without a flaw, and are so dovetailed together that it is impossible for any of them to be displaced. Every one is fitted into those above, below, and on each side, with projections and grooves, and the interstices are filled up with Portland cement. The curved contour of the old light-house is also retained, but with an important modification. Smeaton's famous design, which allows the waves to roll up the curved sides of the column, instead of dividing the stress of the seas, concentrated their force at the top of the tower, where they exercised a powerful leverage upon the base. The tower, with its interlocking blocks of granite, was as strong, when recently taken down, as when it was first erected, over a century before; but the reef on which it was founded, weakened by under-washing, had become insecure. The new light-house is placed on the southern rock, the middle one of the three main reefs, 127 feet from the old one, which stood on the western rock. The Eddystone group of rocks occupies about a square mile at low water. Their situation is nearly midway between Start Point, in Devon, and Lizard Point, in Cornwall, being about ten miles nearer the latter. The rocks are of gneissic formation. The new tower, instead of rising in a parabolic curve from below the high-water mark, is placed upon a cylindrical base of masonry  $44\frac{1}{2}$  feet in diameter. The vertical sides of this solid granite base rise  $2\frac{1}{2}$  feet above high water. From this cylindrical base the curved shaft rises, leaving a terrace  $4\frac{1}{2}$  feet wide all around. The granite blocks of which it is built are some of them  $6\frac{1}{2}$  feet deep and 2 feet thick, with their outer curved face 3 feet 10 inches broad. The height of the focal plane of the light in the old tower was 72 feet above high water, while that in the new house is 133 feet, the former being visible 13 and the latter  $17\frac{1}{2}$  miles.

The Tillamook light-house, placed by the United States Light-house Board on the coast of Oregon, eighteen miles south of the mouth of the Columbia River, is invaluable for the growing commerce of Portland and Astoria with all parts of the world. The coast is lined with precipitous basaltic cliffs. Tillamook Rock is a reef rising 90 feet above the water a mile off shore. The light is 136 feet above the sea. The

dangers of this rock-bound coast are increased by the frequent fogs. The site was selected in 1878, but the sea was never calm enough to permit of landing until June, 1879; and then the first men who landed jumped into the sea to escape a coming storm, and were rescued with life-lines. A man was able three days later to get the measurements, finding that a flat surface of 3,600 square feet could be obtained by leveling the rock to the uniform height of 90 feet. In September a mason landed to plan the buildings, but he was washed off and drowned. In October a party of quarymen were landed from the revenue-steamer *Corwin*, which was moored to a buoy in 25 fathoms of water. A cable was carried from the vessel to the rock, by which men could be landed in a breeches-buoy. It was many weeks before the tools and stores could be landed, and a shelter constructed. The work of excavation, which continued through the winter, was very dangerous. They held on to ropes while drilling the holes, and always kept on the leeward side to avoid being blown into the sea. In January there was a storm which carried away their store-house. The waves, breaking in a chasm which divides the rock into two parts, were dashed over the whole surface continuously for several days. The men were nearly starved before communication could be established again with the steamer. The leveling was completed in May, 1881. The excavated rock was thrown into the chasm for the purpose of closing it, but the largest fragments were soon swept out by the waves. Work was begun on the building in June. All the blocks of stone were squared and numbered at Astoria, and were landed from the steamer by a "traveler" over the cable. The main building is 48 feet by 45, with accommodation for four keepers. Above it rises a stone tower 35½ feet high. In an adjoining building are steam fog-sirens. The light is a white flash-light of the first order.

The recently constructed Darjeeling Tramway or Himalayan Railway unites the steepest grades with the sharpest curves that are found in any existing railroad. The road winds like a serpent among the foot-hills of the Himalayas, and ascends to the region of clouds, the terminus, Darjeeling, being 7,700 feet above the level of the sea. Some of the curves have a radius of only 70 feet, while grades of 50 in 1,000 are encountered. The total ascent in the 50 miles of railroad is 7,400 feet, which gives a mean inclination of 28 in 1,000. The gauge is two feet. The rails are of refined steel. The ties are two feet eight inches apart, with extra ties under the joints, and for the sake of rigidity supporting plates under the outer rails of all the curves of 125 feet radius or less. The cars are open ones of the lightest construction possible. The locomotives are reduced models of the ordinary engine with tender.

The steam-heating of towns is making progress in the United States, notwithstanding fre-

quent and troublesome accidents which the use of so unmanageable an agent as steam entails. In the city of New York two companies have laid steam-pipes through the streets in the most thickly-built portion of the town. There, as in other places, numerous mishaps have occurred from the bursting of joints and breaking of flanges. The pipes are fitted with screw-joints of wrought-iron. The system of fitting invented by the English engineer, Perkins, has not yet been tried. He surfaced the end of one of the tubes and bevelled that of the next one, so that when they were screwed together in a collar the two ends cut into each other and formed a metallic connection.

**ENGLISH CHANNEL TUNNEL PANIC.** The demonstration of the feasibility and commercial profitableness of a submarine railroad tunnel under the Straits of Dover was promptly turned to account by the Southeastern Railroad Company, the French *Compagnie du Nord*, and other English and French capitalists. The ingenious tunneling machine of Colonel Beaumont (see *ENGINEERING*), and the experimental cuttings which proved the continuity and impermeability of the chalk stratum (see *ENGINEERING* in preceding volumes), solved the engineering difficulties. Financial support beyond the requirements was assured to the Channel Tunnel Company presided over by Sir Edward Watkin. The French were eager to co-operate. When the work was already well under way, its success assured, and nothing was wanting but the permission of Parliament, an agitation was started against the scheme which gained such strength that the work had to be suspended until more sober counsels prevail.

The objections to the underground passage were purely strategic. The demonstration that with the advances in naval art the "silver streak," as the English Channel is figuratively designated, could easily be overstepped by modern armaments, and an invading force landed on the southern coast of England without warning, at the rate of a regiment every five minutes, instead of obviating, had really prepared the way for the agitation of military alarmists against the Channel Tunnel. When the experimental operations proved to be a definite success, and the time came to receive the permission of the Government, orders were given at the instance of Sir Garnet Wolseley and other military authorities to stop the work until the subject had been examined by a commission. The Government had entertained no such fears when Lord Derby, as Foreign Minister, in a communication to the French Government, cordially approved the scheme in 1874. The French Minister of Public Works, on the strength of the acceptance of the principle of the tunnel, signed the convention with Michel Chevalier, President of the French Channel Tunnel Company. The scare had already been started, but, when the note of alarm was caught up by the press, it spread among all ranks and conditions of men. Pro-

tests were signed by people who had acquired distinction in every walk of life—poets and soldiers, clergymen, statesmen, judges, merchants, noblemen and trades-union officials. The people were exhorted to shut their ears against ridicule and close their minds to argument in a matter on which the fate of England depended. Peers and members of Parliament who visited the works at Dover were warned against the conversational wiles of Sir Edward Watkin and the bribery of his “champagne lunches.”

The danger apprehended by the panic-monsters was that by a stealthy and treacherous stroke executed in the midst of profound peace the French might seize the English end of the tunnel and forward by train through the submarine passage a force which exceeds the existing military strength of England. An army of one hundred and fifty thousand men would be able to sweep everything before it. It could be transported through the tunnel in a day or two, and march into London in four or five days. An expedition of two thousand men could capture Dover and hold it while the troops were coming by the railroad. It would require no stronger force to overpower the garrison after effecting an entrance into the fortress by surprise or by escalade. A body of two thousand could either come by trains after taking possession of the telegraph and using artifices which could not be detected, or they could be disembarked in the harbor on any dark night, or they could come in disguise and collect on the British shore, arming themselves from secret stores of weapons. The British navy would be powerless while the French were pouring their battalions into the heart of England. The temptation to an unscrupulous military adventurer, whose dire ambition might never be suspected under his perhaps “lawyer-like exterior,” would be the richest and the easiest conquest which the world offers. In possession of the capital and of the arsenal at Woolwich, from which alone a fresh army could be equipped, the French might exact any terms, perhaps fifteen milliards of francs, the surrender of the British fleet, and probably the British end of the tunnel. The last loss would be irreparable. If Britain could ever hold up her head again among nations, it would only be by adopting the system of universal military service. France with her whole population under arms need fear nothing from England, but bridging the “wet ditch” would destroy the independent position of the “tight little island,” and entail the military system upon Great Britain under which the Continental nations groan.

These fears, springing rather from sentiment than reason, could not be understood by Moltke and other European strategists, but they prevailed among the soldiers and sailors of Great Britain. On the Continent, railroads cross every frontier in all directions. The nations are glad to have their mountain barriers pierced by

tunnels, and do not even fortify the entrances. The Germans, when invading France, left the railway cars and marched around tunnels for fear of arrangements for their destruction. The French Government has favored every project for bridging the channel.\* They have never felt any tremors.

The English advocates of the tunnel have met the anxieties of the military alarmists by proposing plans for rendering the tunnel-mouth secure from the imaginary treachery and surprise. As long as the British ironclads hold the sea, a few well-directed shells from a frigate could close the mouth of the tunnel at any time. The Castle of Dover is considered a first-class fortress, and safe from capture by a *coup de main*. A strong outwork, or casemated batteries excavated in the cliffs, with guns constantly trained upon the entrance to the tunnel, could be built and connected with the fort by a subterranean passage. A narrow gallery could be dug from the fort down to the tunnel, and arrangements made by which the tunnel could be flooded by having iron pipes passing from the sea into the tunnel, closed by stop-cocks, which could be turned at any time by the officer of the guard. The ventilating engines could pump their smoke into the tunnel instead of air, and it would at once become impassable. Reservoirs could be opened, letting carbonic-acid gas flow into the tunnel. Colonel Frederick Beaumont suggested that trains should emerge from the tunnel by being lifted through a vertical shaft by hydraulic elevators, and that the inclined gallery connecting the tunnel with the land lines should be blocked by a time mechanism, in such a way that it would require some definite time to open it to traffic, and that its entrance should be directly under fire from the batteries. The arrangement of a hydraulic lift was deemed a sufficient safeguard by Lord Dunsany and General Wolsley, the leading opponents of the tunnel, but one which would deprive the passage of its value for speedy transit.

Two projects for a channel tunnel were submitted to Parliament, and referred to a com-

\* Napoleon Bonaparte, when First Consul, took an interest in the plans of Matthieu for a tunnel. Thomé de Gomond elaborated a scheme in 1856 which the third Napoleon proposed to put to the test. It was for a tunnel with ventilating shafts rising through thirteen artificial islands. Several engineers, fearing the danger of a tunnel's crossing fissures or quicksands, have proposed submerged tubes. Bateman, an English engineer, planned a cast-iron tube built out in separate lengths, within a sliding cylinder. Zerah Colburn, the American engineer, suggested constructing one eighteen feet in diameter on a dry-dock, and hauling it out as each section was added, until the floating tube reached the opposite coast. Bradford Leslie, an engineer from India, worked out a plan for a tubular floating tunnel held down to a certain depth under the water by anchors. A visionary project for a bridge over the strait was considered by Louis Napoleon. Low's plans for a tunnel, approved by Sir John Hawkshaw, which were the basis of the present enterprise, were propounded about 1867. John Fowler has taken advantage of the recent controversy to revive his scheme for conveying railroad trains across on ferry-boats. Sir Henry Bessemer's ingenious ship with a swinging saloon, which knocked away a portion of the Calais pier, failed because its shallow draught rendered it unsteady. Captain Dicey's double-hulled steamers proved too slow.

mittee of the House of Commons, which condemned them both. The report of the committee precludes the construction of any tunnel until other ideas control the minds of the military authorities. The Duke of Cambridge, commander-in-chief, thought that the company should first of all be required to deposit in the treasury a sum sufficient to construct a first-class fortress and maintain a garrison of 10,000 men. The absolutely necessary military precautions demanded by him and General Wolseley, and indorsed by the committee, were that the tunnel's mouth should be beyond range from the sea, commanded by the guns of such a fortress, and provided with a portcullis. There should be arrangements at command from within the fort, and at different points outside, for filling the tunnel with asphyxiating gases, for temporarily flooding it by means of sluices, for closing the entrance with mines on the land, and for permanently flooding it by mines above the roof, opening communication with the bottom of the sea. Even these precautions would not satisfy the nervous warriors of England, who dread that the tunnel and its defenses might still be captured intact by a conquering army invading England by sea, and permanently held by the victors.

**EPIDEMIC DISEASES, SANITARY CONTROL OF.** The sanitary control of epidemic disease in the United States, or, rather, its attempted control, is of so recent origin that at the present day but little other than the results of limited experience which has been gained in the last few years can be recorded, leaving to the future the final collation of the accumulated evidence, and the settlement of the points involved. Enough has been learned, however, by that experience, and by the experience of foreign nations, to justify the assertion that the diseases now classed as epidemic may be placed under control. We say epidemic diseases, but, properly speaking, we should rather say that such diseases are of a specific nature, liable to be spread by certain material influences. There is at this time no reason for going into the discussion of the contagious or non-contagious nature of a class of diseases known to invade certain localities at certain seasons of the year, and to affect large numbers of the human family; for modern researches into the causation and origin of the class mentioned have proved beyond a doubt that they are produced by a certain germ or seed, capable, under favorable circumstances, of self-propagation, and communicable by certain recognized agents. Among these agents, air, drinking-water, and food, in the order named, are believed to be the principal infection-carriers. Researches of Pasteur, Koch, and others, have placed the germ or seed theory beyond dispute; and, although some doubt has been expressed as to the demonstration of the particular bacillus of each specific disease, yet their existence, and the general agreement among sanitarians as to the essential correct-

ness of the theory, that epidemics are consecutive and not synchronous, is, we think, established. There are five specific diseases which have prevailed at different periods in the history of mankind, about which the question of transmission is pretty clearly established. These are the Oriental plague, cholera, measles, small-pox, and yellow fever. There are certain other specific diseases, highly infectious in their nature, which, although rarely taking on the form of general epidemics, are yet transmissible by some one of the vehicles mentioned. These are typhoid fever, diphtheria, and scarlet fever. It is common to speak of all the affections above enumerated as preventable diseases, although it is best not to accept that term in its literal sense; for, while it is true that they may be prevented from becoming epidemic by means hereafter to be mentioned, yet it is doubtful if the germ can be swept from the face of the earth, except by a more united effort than has heretofore been made, or is likely to be made in the near future. It is, perhaps, scarcely in place to mention the diseases of animals belonging to this class, in this paragraph; but the experiments of Pasteur in regard to the prevention of chicken-cholera and silk-worm disease, and that of the veterinarians of this country in the prevention of pleuro-pneumonia and glanders, are directly corroborative of the prevailing theory regarding diseases peculiar to the human race. Without dwelling further on this phase of the question, we pass directly to the consideration of the essential characteristics of one of the diseases named. The plague is a contagious specific fever, attended with an eruption of carbuncles, and swelling of the inguinal and other glands of the body. Hecker, who has written an extensive work on this disease, assumes that Europe alone has lost no less than twenty-five millions of its inhabitants in the various epidemics of the plague that have occurred. He says: "In regard to the nature of the contagion, every spot which the sick had touched, their breath, their clothes, spread the contagion; and, as in all other places, the attendants and friends, who were either blind to their danger or heroically despised it, fell a sacrifice to their sympathy. The pestilential breath of the sick who expectorated blood caused a terrible contagion far and near; for even the vicinity of those who had fallen ill of the plague was certain death, so that parents abandoned their infected children, and all the ties of kindred were dissolved."

"The contagion of the plague appears to have frequently been conveyed by drinking water from the very inefficiently protected wells; hence there arose a cry that the wells were poisoned, and suspicion fell upon the Jews, who were almost everywhere racked and tortured, burned and massacred."

Dr. Russel states that "in the most destructive forms the vital forces appear to be suddenly annihilated by a most intense and malignant

blood-poisoning, and death is remarkably rapid, without external eruption of buboes, carbuncles, or spots. In such cases the body has no time to show the 'tokens' before death. In the great majority of cases the disease is preceded by lassitude, loss of strength, anxiety, and afterward by vomiting. The characteristic swellings in the arm-pits and groin follow, petechiæ and carbuncles appear, delirium succeeds, and too frequently death. Pathology shows rather the effects of the poison on the tissues and organs, as shown by enlargement and congestion of the spleen, kidneys, etc., than anything especially characteristic. There are numerous hæmorrhagic effusions, and dissection shows that buboes always result from enlargement and suppuration of the lymphatic glands. It is probable that all the fluids and secretions of the plague-stricken body are contagious" (Dr. Blythe, "Dictionary of Hygiene").

The symptoms of cholera, small-pox, and yellow fever, are so well known that no particular mention need be made of them in this place.

**CONVEYANCE OF INFECTION BY AIR.**—The atmosphere is essentially a diluent of all gaseous poisons. It has practically this effect in relation to germ-diseases, for it is evident that, when the germs are scattered through a large quantity of air, the propagation is retarded; for the seeds being less numerous, their effects are not so apparent; but the distance to which specific germs can be transmitted in the air can not at this time be definitely stated. The air, however, is always infected in the immediate vicinity of *fomites*, which is a rather vague term, meaning any substance which may retain germs from a plague- or fever-stricken patient. Thus there are included in this general term all textile fabrics which have been in contact with patients, such as clothes, rags, bedding, linen, and the like. It is reasonably certain that such fomites, having been in contact with the excreted or vomited matters, perspiration, or other exhalations from the skins of patients affected with some one of the specific diseases, afford a safe place of refuge for the germs; and if fomites be placed in boxes or trunks, or in bales, they retain the power of propagation through an indefinite period of time; and such fomites, when placed in favorable conditions, allow the transmission of the germs to the air surrounding them, and thus the contagion is supplied, to be disseminated from one place to another. In the epidemics of the plague in Asia, it has been demonstrated that rugs and the like, when carried to a place quite remote from the original place of infection, and opened out, have been a cause of the development of the disease in a new and before unaffected locality. This also accounts for the sudden outbreak of epidemics in remote points. In the cholera epidemic of 1873, in the United States, the Crow River settlements in Minnesota were free from cholera until the

opening of baggage at Willmar, brought thither by immigrants from Europe (McClellan, "Cholera Epidemic of 1873 in the United States," Washington, 1875, p. 441). It is believed to be a fact that the outbreak of yellow fever at Memphis, Tenn., in 1879, originated in the unpacking and airing of certain infected clothing that had been stored away since the terrible epidemic which had visited that city in the previous year; and such cases have been of so common occurrence as to give cause for a well-grounded fear of retaining year after year, in any house, textile fabrics which have directly or indirectly been in contact with yellow-fever patients. In regard to the general infection of the air, it has been demonstrated that a strong current of air, blowing over infected articles, will convey the germs in sufficient numbers to develop the disease in persons inhaling the infected air; and it has even been known to affect animals. For instance, the widely-known Ceeley case, reported in "Transactions of Provincial Medical and Surgical Association," quoted by Aitken ("Science and Practice of Medicine," vol. i, 1872, p. 400), as follows: "At the village of Oakley, about sixteen miles from the town of Aylesbury, small-pox had been epidemic from June to October, 1840. Two cottages, in which three persons resided during their illness, were situated, one on each of two sides of a long, narrow meadow, comprising scarcely two acres of pasture-land. One of these three patients, though thickly covered with pustules of small-pox, was not confined to her bed after the full development of the eruption, but frequently crossed the meadow to visit the other patients—a woman and a child—the former of whom was in great danger from the confluent malignant form of the disease, and died. According to custom, she was buried the same evening; but the intercourse between the cottages across the meadow was still continued. On the day following death, the wearing-apparel of the deceased, the bedclothes and bedding of both patients, were exposed for purification on the hedges bounding the meadow. The chaff of the child's bed was thrown into the ditch, and the flock of the deceased woman's bed was strewed about on the grass over the meadow, where it was exposed and turned every night, and for several hours during the day. This purification of the clothes continued for eleven days. At that time eight milch-cows and two young heifers were turned into the meadow to graze. They entered it every morning for this purpose, and were driven from it every afternoon. Whenever the cows quitted the meadow the infected articles were again exposed on the hedges, and the flock of the bed was spread out on the grass and repeatedly turned. These things remained until the morning, when the cows were readmitted, and the contaminated articles were supposed to be withdrawn. It appears, however, that the removal of the infected articles was not always accomplished so

punctually as had been enjoined, so that, on one occasion at least, the cows were seen in the midst of them, and licking up the flock of the bed which lay on the grass. These cows were in perfect health when first put out to grass in this meadow; but in twelve or fourteen days, five out of the eight milch-cows showed symptoms of sickness, and the whole of the cows were certainly affected within three days of each other," with the general symptoms of small-pox.

Immersion in water seems to have but little effect in destroying the germs of yellow fever and small-pox, for it has been noticed that an infected mattress thrown into the Mississippi River from a steamboat, and afterward recovered by persons living on the shore, communicated the contagion. The air is also infected by the presence of bodies dead of specific diseases. To such an extent is this the case that in many cities public funerals of persons who have died of certain specific diseases are forbidden. The so-called "sewer-gas" is simply air polluted by the various organic matters contained in the sewers; and, as the diseases have their specific seed or germ, it follows that they can not be spontaneously generated from a gaseous poison. Sewer-air, however, may be a carrier of infection when the seed is sown, and it is certain that sewage itself, and the cryptogamic growths on the sides of sewers and house-drains, afford a favorable field for the propagation and development of fever-germs, especially typhoid fever, scarlet fever, and diphtheria; and, when the excreted matters from a typhoid-fever patient are conveyed into the sewer, they may then affect the air passing through it, gain entrance into the house, and in this manner spread the infection. If it were possible to prevent the discharges from typhoid-fever patients, and expectorated matter from patients suffering with diphtheria, from gaining entrance to the sewers, it is doubtful, in view of existing theories, if sewer-air could ever be a means of propagating these infections.

**WATER AS A CARRIER OF INFECTION.**—The most frequent means of propagation of typhoid fever as well as cholera is by water-carriage of the germ. The several outbreaks of typhoid that have occurred in England and this country have been traced, without much possibility of error in the conclusion, to water used for drinking purposes having become infected with the excreta from typhoid-fever patients. In a recent epidemic in England it is believed that it was due to the washing of milk-pans with polluted water!

Dr. MacNamara states: "The eighth characteristic of cholera is that the more explicit the examination the clearer the fact appears that the disease in the majority of cases spreads from one human being to another by means of the cholera fomes finding its way into drinking-water, and thus into the intestines of other people." Of the truth of this proposition there is abundant evidence.

**FILTH AND SEWAGE.**—In consonance with the views expressed as to the specific origin of the infection named, it follows that no amount of filth, no amount of ordinary sewage, can produce epidemic disease of its own accord, unless the seed be previously sown. It is certain, however, that fever-germs are best propagated and attain their greatest malignity where filth is found in the greatest abundance. That it will not produce it is proved. An example illustrating this fact was recently given by Minister John M. Langston in regard to the sanitary condition of Port-au-Prince, Hayti ("Bulletins of Public Health," Marine Hospital Service, 1881, page 114): "The streets (of Port-au-Prince) are exceedingly foul, and police regulations of no sort are enforced. There is no regulation to oblige even the filthiest person to remove deposits from the streets, or from the gutters and sidewalks; and the harbor is also full of foul matter of every sort." Now, although this filthy condition had then existed for several years, in one of the hottest of climates, the filth itself saturated with moisture, and necessarily raised to the elevated temperature tending to develop the latent germs of yellow fever, if any were present, the city was free from it for a period of fifteen years up to 1879, although it raged in the adjacent islands. It is known that heat and moisture favor the development and propagation of specific fever-germs when once sown, with the exception of the small-pox virus, which attains its greatest malignity at a low temperature.

**SANITARY CONTROL.**—From what has been said as to the general nature of infection and the means for its propagation, the measures to be adopted for the sanitary control of epidemic diseases are almost self-apparent. They are such, in the first place, as will destroy the germs; and, in the second place, to enforce perfect cleanliness, so that the germs, although gaining entrance to the proper spot, shall not find a harboring-place for their propagation. One of the first things that should interest a municipal health officer is the sanitary history of his town or city. He should ascertain with especial care the periods at which epidemics of any kind have appeared in the city or village under his charge. Wherever possible he should ascertain by investigation the spot where the first case made its appearance, and, if possible, trace the source of infection. Then the directions in which it spread from the initial cases should be noted. Other things being equal, the average meteorological conditions of the locality being practically unchanged from year to year; the introduction of the infection in a particular manner will usually lead to the same result in any given year, as in the past, favored on the one hand by increased population and diminished on the other by its decrease. Having mastered the details as to the past history, he should next ascertain the present sanitary condition of the locality by the inspection of the place, and an examina-

tion of its vital statistics as reported to the proper officer, week after week; its cleanliness or uncleanness; bearing in mind its history and the sources from which infection is likely to be admitted. The natural influence of locality favoring the propagation and spread of certain diseases may be entirely changed by perfect cleanliness. The experience of the British in India, and the French in Africa, is on this point quite conclusive. Cholera is a disease believed to have originated in Asia (the banks of the Ganges being, perhaps, its native habitat, if, indeed, a place of nativity can be assigned to it). It is called Asiatic cholera, in recognition of the place of its nativity. Professor Blanc ("Cholera, how to Avoid and Treat it," London and Paris, 1873, p. 40) states: "While I was on special duty in Abyssinia, cholera gained the camp of the Emperor Theodore, where it was brought by recruits from Tigré, in May, 1866. This disease had been making havoc in Tigré. We were not surprised, therefore, to hear that it had spread over other provinces, and that several cases had already broken out in Kourota, a town situated on Lake Tana. The King's camp was pitched in a very unhealthy situation, on low, swampy ground. Fever, diarrhoea, and dysentery had prevailed to a great extent. The Emperor, in the hope of arresting the spread of the epidemic, moved his camp to the neighborhood of Kourota. A worse place he could not have selected. He first encamped on a low promontory south of Kourota, but the cholera had by this time broken out in the camp and hundreds were dying daily. He again moved his camp, this time to some high ground a mile or so north of the town. The church was so completely choked up with dead bodies that no more could be admitted, and the adjoining streets offered the sad sight of countless corpses, surrounded by the sorrowing relatives, awaiting for days and nights the hallowed grave in the now crowded cemetery. At last the Emperor asked for my advice. I told him to proceed at once by different routes and follow the many small streams that flow from the highland of Begemder; to protect from pollution the water used for drinking; and, once on the plateau, to break up his army as far as possible, selecting a few healthy, isolated localities, where every fresh case that broke out should be sent. He acted upon this advice, and before long had the satisfaction of seeing the epidemic lose its virulence, and before many weeks disappear entirely." Dr. Blanc shows by the above case how much may be done by isolation and scattering into camps, and separation of the sick from the well, and, to indicate how much better the disease was managed in India, under sanitary control, cites the following instance:

"Cholera had been raging during May and June, 1872, in the Mahratta country, a well-populated district, stretching from the eastern slope of the Bombay Ghauts. The altitude of

this plateau averages 2,000 feet above the level of the sea. It is mostly composed of laterites, well cultivated, sparsely wooded, possessing a few running streams, more or less dried up in hot weather, and a moderate rain-fall for India. We had learned from the reports of the police and civil officers in charge of the districts that the epidemic was of a most virulent type. Some medical subordinates were sent to the localities most infected, and they confirmed the great extent and severe character of the outbreak. I was at the time civil surgeon of Sattara, a town of some 23,000 inhabitants. . . . Informed of the progress of the epidemic in the direction of Sattara, with the assistance of the civil authorities, the following sanitary measures were carried out: The whole town was thoroughly inspected, filth and rubbish were carted and burned to leeward of the town, drains were flushed, houses were whitewashed, gardens cleared out, and all excrementitious matters removed to trenches dug for that purpose near the city, and filled with earth. Policemen were stationed at the different roads leading to the city, provided with medicines to distribute to persons suffering from diarrhoea, and directed to accompany to a building set apart for the purpose any case of cholera that should be reported to them. The town fortunately receives an excellent supply of drinking-water from a small lake situated on a hill in the vicinity of Sattara. Policemen were posted at the reservoir which receives this water; the place around was kept clean and dry, and no one was allowed to bathe or wash clothes at it or in its vicinity. The inhabitants were warned not to use the water of their wells for drinking purposes, but to fetch it from the reservoir. They were also told to apply for medicine on the first appearance of diarrhoea, and that every case of cholera that declared itself in the town should be taken to the hospital, and that myself or my subordinates should be informed of the occurrence, when some one belonging to the hospital staff would visit the patients. In the beginning of July a few cases were admitted into the cholera hospital, one or two a day, during some eight or ten days. Every one of these cases had been contracted in the villages south of Sattara, the district where the cholera was at the time prevailing. All the discharges of cholera-patients were at once saturated with disinfectants, and buried in trenches dug for the purpose, and the clothes and bedding of all were destroyed. A good ventilation, fires, and disinfectants were used in and around the cholera-ward." Although Sattara was surrounded by villages, and in all of them the cholera raged for several weeks, not a case broke out in the city while under this management. About a mile from Sattara there was a military cantonment, composed of European civil and military troops. This cantonment had a strict quarantine enforced around it as long as a single case of cholera remained under treatment at the hospital, and for some

days afterward no communication was allowed between the town and the camp. It also escaped the general infection.

CONTROL AFTER AN EPIDEMIC HAS BROKEN OUT.—From the foregoing it will be seen that the most active measures should be taken to *prevent the introduction* of infectious or contagious diseases, *preventive* measures taking in all cases the highest rank, cleanliness and watchfulness being the most important. Dr. Blanc's plan at Sattara could not well be improved upon. Unfortunately, however, in the United States, a land of universal liberty, liberty is too often interpreted to mean license, and the people are impatient of sanitary regulations sufficiently rigid to prevent the introduction of specific diseases. It therefore follows that it is only in great public exigencies that the reasonable and necessary means for their prevention can be carried into effect. We must, then, make up our minds to combat disease after it has appeared and becomes epidemic, rather than expect to prevent it, in the present state of popular information upon this subject.

The common carriers of commerce are usually the vehicles by which diseases are transmitted from place to place. Ships and steamboats afford more favorable conditions for the growth and propagation of germs than railway-cars, on account of the ever-present moisture in the vessels, and the greater humidity of the air immediately surrounding them. Maritime quarantines, therefore, are essentially necessary to guard against the natural tendency of water-craft to spread contagion, but it would be more in accordance with the nomenclature of the day if the term "quarantine" were abandoned and "inspection-station" substituted, for all vessels should be periodically inspected, whether infected or not. The sanitary inspector should be not only well informed in regard to fomites and the sanitary condition of the port or place from which the vessel has arrived, but he should be sufficiently versed in marine architecture to enable him to thoroughly examine every portion of the vessel. The crew and passengers should be mustered, and, if any are sick from contagious disease, they should be immediately removed from the vessel, and the state-room or berth, with the bedding therein contained, thoroughly fumigated and disinfected, or preferably burned, and the sick persons themselves removed to a hospital for contagious diseases, established for that purpose. If the vessel be otherwise thoroughly clean, she will be healthful, and may be allowed to pass without detention. On the other hand, should the vessel be found in an unclean state and the bilge-water foul, she should be pumped out as dry as possible, and thoroughly disinfected. It is always safe to pump out the bilge-water whenever opportunity offers. Various kinds of disinfectants have been recommended, but it has been found by experience that the one of most

easy application in such cases is sulphurous acid gas. This is applied by placing a brazier in which charcoal has been lighted in the place to be fumigated, and throwing on the red-hot coals, or in a basin placed thereon, a quantity of crude sulphur. As the sulphur burns, sulphurous acid gas is thrown off, and permeates every portion of the apartment in which it is placed. It is highly destructive to bacteroid growths. Before placing the brazier in the hold, the bilge-water may be replaced by new sea-water—itsself a capital disinfectant—and again pumped out.

When a case of small-pox or yellow fever is found to exist in a house in town or city, practically the same measures should be taken—namely, removal of the sick to a special hospital, disinfection of the apartment, thorough fumigation of the entire house, and the prevention of well or unprotected persons gaining access to the apartment. If it be a house in a crowded portion of the city, it should be promptly quarantined, and the patient removed to a hospital for contagious diseases; or, if this be not practicable, the patient should be effectually isolated. All bedding and clothing exposed to infection, carpets, window-hangings, wall-paper—if the room be papered—picture-backs, when covered with paper, and everything capable of retaining the disease-germs (fomites) should be burned or buried in a trench. When a case of cholera has appeared, the discharges from the bowels should be covered with chloride of lime, and, whenever practicable, thrown into a furnace. No such matters should be thrown upon the ground or allowed to gain access to the public sewer, and all persons should be warned to promptly check any attack of diarrhoea, however slight. By these means alone it is possible to prevent the spread of these epidemic diseases in town or city; provided, however, that the surroundings of the infected house be cleaned and properly disinfected. Out-door disinfectants for use in such cases consist of copperas, ordinary quicklime, or chloride of lime—the latter being the most powerful, but objectionable to many on account of its giving off chlorine, which has a very pungent, acrid odor.

Public funerals in all cases of death from small-pox, cholera, yellow fever, and diphtheria, should be prohibited and the coffins hermetically sealed; when this is impracticable on account of the expense, the same result may be attained by coating the body with tar. The practice of cremation instead of the ordinary inhumation is to be commended, on sanitary grounds, in all such cases.

SANITARY CORDONS.—Sometimes, however, cases of infectious disease have escaped control by the ordinary measures. In order to prevent the spread of the disease to contiguous villages, towns, and adjoining districts, it has been found expedient to establish a sanitary cordon about the town or city, while, at the same time, sanitary measures are being carried

on within it. A cordon consists of a body of police, militia, or military, patrolling a certain line, extending, according to the necessities of the case, a sufficient distance to completely invest the infected district. A better illustration can not be given of a sanitary cordon than the description of the manner in which it was managed in Russia, and more recently in the United States. The Oriental plague made its appearance in the district above Astrakhan, in Russia, about the middle of November, 1878. It prevailed along the river Volga, and upon its islands. The center of the malady was in the village of Wetljankaja, with a population of some seventeen hundred inhabitants. The Governor of Astrakhan telegraphed to the Minister of the Interior the report of the medical supervisor of the Cossack forces in the district of Astrakhan, Dr. Depner. A few cases had appeared in the previous year, but the disease had not become epidemic until, as before stated, November, 1878. From the 27th of November to the 9th of December, out of one hundred sick in Wetljankaja, forty-three died; and in less than a month two hundred and seventy-three persons died of the disease. It then spread from Wetljankaja to the surrounding villages, and was declared epidemic. "Dr. Koch and six army-surgeons became victims to the epidemic, the priest died, the Cossacks who attended the sick or removed the dead died; almost all died who in any way came in contact with the sick or dead." Dr. Depner then arrived at the conclusion that the only means for suppressing the disease was quarantining; and on the 11th of December Dr. Depner with Colonel Preibanow instituted measures. He could not prosecute further observations, however, for he himself fell sick with the plague. These facts being telegraphed to the Emperor of Russia, the imperial committee of ministers was convened, and the following rules were adopted, which received the imperial sanction:

"1. (a.) The inhabitants of the colony of Wetljankaja shall be transferred and distributed as shall seem best after a careful examination of the local requirements, the limit of the quarantine not to be overstepped.

"(b.) The appraisement of the movable and immovable property destroyed by fire, as likewise the fixing of the indemnities to be paid to

the owners, shall be reserved for a special commission, under the presidency of the Governor of Astrakhan, with the participation of members of the Cossack administration and of the Ministry of the Finances, the Ministry of the Domains, and the Ministry of the Interior, according to regulations which shall be prepared on the spot by the aforesaid commission.

"(c.) This commission shall be charged with the execution of all the measures that may be necessary for the destruction by fire of the colony of Wetljankaja, as likewise of all measures necessary to supply the population transferred from that colony with food, underclothing, and warm garments—to provide for the treatment of the sick, etc.

"2. That the acting Minister of the Interior may be authorized to extend the measures referred to concerning the colony of Wetljankaja, to other villages, as well as to isolated buildings everywhere, to such extent as shall be deemed indispensable.

"3. That three regiments of Cossacks may be immediately placed at the disposal of the civil administration for the quarantine service.

"4. That all outlays necessary for the execution of the measures above referred to, and to meet the expenses of all measures that may be required by the present epidemic, may be charged to the account of the imperial treasury."

MAP OF THE DISTRICT INFECTED BY PLAGUE.

[The lines a a represent the military cordon drawn around the infected villages; and b b the protective cordon maintained around Zarizin, an important commercial point and terminus of the Russian railway system. The village of Wetljankaja was the original and principal center of infection.—*Bulletin of Public Health.*]

It was the unanimous conclusion that "the plan of burning the colony of Wetljankaja (the center of the infection) is proposed after a thor-

ough examination of the question, and from a conviction of the indispensable necessity of so radical a measure for the extirpation of the disease in the locality where it first appeared—the committee having subsequently heard the opinion of the physicians present, both with regard to the measure in question, and in general in relation to the means which have been shown by science and experience to be best adapted to put a stop to an epidemic, and to prevent it from spreading.”

In addition to the irregular troops mentioned above, bodies of infantry were placed at the disposal of the civil establishments, and unlimited credit was opened to meet all expenses from the Treasury. His Majesty the Emperor sent a special commissioner plenipotentiary. A commission was appointed to act in the matter, composed of medical specialists, whose duty it was to study the subject of the progress of the epidemic, and the proper means of stamping it out, and purifying the localities

measures adopted against it; and the instructions were carried out as above outlined, under the direction of Aide-de-Camp General Count Louis-Melikoff, who was sent to the infected locality with the rights and privileges of a temporary governor-general. On the arrival of Count Louis-Melikoff, in March, 1879, an international sanitary council was held, composed of the most distinguished sanitarians of Europe, Professors Hirsch, Besiadetsky, Cabiadis, Petrisco, and Eichwald. By the advice of this International Council, a general sanitary cordon was established all round the province of Astrakhan, with the object of protecting Russia and neighboring countries of the empire,\* and Professor Eichwald advised that the sanitary cordon should be maintained around the infected region until the 2d of May. These measures were entirely successful, and the plague did not spread to any other place outside of the originally infected district, nor has it reappeared.

then infected or those likely to become so; and in view of the impression produced in foreign countries by the reports of the plague, they should furnish to the government reliable information concerning the epidemic, and the

The efficacy of this plan, although on a much smaller scale, has been sufficiently shown in this country. Space is not sufficient to go into details regarding it, but an opportunity

\* See map on page 291.

occurred during the summer of 1882 to test it still further. A serious epidemic of yellow fever broke out in Bagdad, Tampico, and Matamoros, Mexico, and soon spread to Brownsville, in the State of Texas. There were in a short time, out of a city of some 5,000 inhabitants, between five and six hundred persons sick of yellow fever. A general panic prevailed throughout Southwestern Texas, and refugees were leaving that part of the State in great numbers, as it was believed the infection would rapidly and certainly extend to the surrounding country. In these circumstances, an appropriation of \$100,000 having been placed at the disposal of the Treasury Department by the President, to prevent the spread of epidemics, the Governor of the State of Texas applied to the Secretary of the Treasury for assistance from the General Government; and, as the exact area of the infected region was undetermined, at my suggestion a cordon was immediately established from Corpus Christi, on the Gulf, to Laredo, on the Rio Grande, along the line of the Texas and Mexican Railway. No person was allowed to pass this cordon until after ten days' detention at some one of the quarantine stations (represented by flags upon the accompanying map),\* that length of time being considered necessary to determine whether or not the particular person would be attacked with yellow fever. Baggage was not allowed to cross the line upon any pretext. A hospital was established in the city of Brownsville, a dispensary opened, and experienced physicians and nurses sent there, who were constantly employed in the treatment of the poor, and all persons unable to pay were treated and cared for at the public expense. These physicians also aided the health authorities of the city in carrying out sanitary measures, including the fumigation of houses.

As soon as practicable after opening the hospital, an inner protection cordon was established, thirty miles from Brownsville, the original cordon having been one hundred and eighty miles distant. Perfect liberty was allowed to the inhabitants of the infected city to leave at any time, and they were encouraged to scatter in camps; but they were not allowed to cross the cordon until after personal detention of ten days, and fumigation of their wearing-apparel; and, as in the case of the outer cordon, the crossing of baggage was positively interdicted. It was intended to remove the upper cordon between Laredo and Corpus Christi within ten days after the formation of the inner one, which extended from Santa Maria, on the Rio Grande, to the mouth of the Sol Colorado; but it was retained for several days longer, as certain of the refugees who had left Brownsville prior to the establishment of the Colorado cordon developed yellow fever. They were quarantined in the camps where they were, and their infected bedding and baggage burned. The fever continued its

spread and devastation on the Mexican side of the Rio Grande, and Reynosa, Camargo, Mier, and Guerrero successively became infected. It was then found necessary to protect the entire line of the Rio Grande, from Laredo to Santa Maria, a distance of nearly five hundred miles, by a cordon. The upper cordon, from Laredo to Corpus Christi, was then removed, and the line re-established along the Rio Grande, and the crossing-places carefully guarded; and, although the towns in Mexico were greatly devastated by the disease, there was no extension of it in Texas: on the contrary, it was confined to the limited district where it first appeared, bounded by the Colorado cordon on the one hand and the Gulf of Mexico upon the other. The Mexicans, seeing the good effects of the sanitary cordon in the United States, followed the example, and established quarantine stations in Mexico, guarding against the infected towns; and there, too, the quarantine proved successful, and arrested the spread of the disease. The Governor, the State Health Officer, and the State officers generally, assisted the work of the Government by all the means at their command. It was, however, opposed by the mayor of the city. In July, a few cases of yellow fever appeared in Pensacola, Fla., and later the disease became epidemic, and, as in Texas, a general panic prevailed. The villages and towns surrounding Pensacola established a rigid quarantine against it, no person from that city being allowed to enter except after proper detention and fumigation. In consequence of this, the towns that had thus protected themselves by the quarantine were not infected, and the disease did not spread, while the places adjoining, that did not quarantine against Pensacola, had the fever. The Government also protected its navy-yard, which joins the city of Pensacola, by means of a sanitary cordon and non-intercourse with the city during the prevalence of the epidemic, and it, too, escaped. With these facts and this experience to guide us, it may be safely asserted that with proper management it is possible to prevent the spread of epidemic diseases from one locality to another.

To prevent the recurrence of epidemics, it is necessary to adopt the same measures as those recommended in the beginning to prevent its original introduction. It is, that all fomites should be either carefully and well fumigated or destroyed, and the utmost cleanliness should be enjoined; and if it were possible to do so, as in the case of Russia, houses that are notoriously infected should be burned and their owners compensated from the public funds. It is greatly to be feared that the failure to burn infected bedding and clothing in Texas and Mexico may result in the reappearance of the yellow fever during the coming season. This disaster may be prevented if timely action be taken. It is, however, owing to the political constitution of the country, beyond the con-

\* See page 292.

trol or action of the officers of the United States.

JOHN B. HAMILTON,  
*Supervising Surgeon-General,  
U. S. Marine Hospital Service.*

**EUROPE, AREA OF.** A very comprehensive work on the area of Europe has been published, during 1882, by General Strelbitzky, of the Russian general staff, under the auspices of the Central Statistical Committee of Russia. It contains estimates not only of the land surface of the various countries, but also of the islands in the adjoining waters, the areas of the basins of the rivers, the areas covered by lakes both on the mainland and on the islands, also the areas of islands in the lakes, etc. In this work he estimates the total area of Europe at 10,410,486 square kilometres, or 3,865,210 English square miles, which are divided as follow among the twenty-three countries occupying Europe :

COUNTRIES.	Square miles.	Per cent of the total area of Europe.
Russia.....	2,129,289	54.9
Sweden and Norway.....	299,625	7.8
Austria-Hungary.....	241,563	6.3
Germany.....	203,502	5.4
France.....	205,935	5.3
Spain.....	198,294	5.1
Turkey.....	180,140	4.6
Great Britain.....	121,466	3.2
Italy.....	111,410	2.9
Denmark.....	54,902	1.4
Roumania.....	50,736	1.3
Portugal.....	34,420	.9
Greece.....	19,815	.5
Servia.....	18,761	.5
Switzerland.....	15,978	.4
Netherlands.....	13,741	.3
Belgium.....	11,375	.3
Montenegro.....	3,630	.09
Andorra.....	175	.004
Lichtenstein.....	61	.002
San Marino.....	33	.0003
Monaco.....	9	.0002

Of the total area of Europe, the continent contains 3,608,750 square miles. The surface of the islands, which is about one fourteenth that of the continent, is 256,560 square miles, and is divided as follows among the different waters of Europe :

Islands in	Sq. miles.	Islands in	Sq. miles.
Atlantic Ocean.....	168,574	Adriatic Sea.....	1,296
Arctic Ocean.....	88,605	White Sea.....	191
Mediterranean Sea.....	82,522	Sea of Marmora.....	70
Baltic Sea.....	12,753	Sea of Azov.....	41
North Sea.....	2,487	Black Sea.....	21

Great Britain, which, with an insular territory of 121,464 square miles, possesses only two square miles of mainland, is followed by Denmark with 45,401 square miles of islands and 9,501 square miles of mainland. The insular territory of the other countries is as follows :

COUNTRIES.	Sq. miles.	COUNTRIES.	Sq. miles.
Russia.....	42,370	Spain.....	1,991
Italy.....	19,383	Austria.....	1,272
Norway.....	8,583	Germany.....	1,029
Greece.....	3,871	Netherlands.....	683
Turkey.....	3,920	Portugal.....	17
France.....	3,656	Roumania.....	0.4
Sweden.....	3,040		

The principal islands of Europe and their area are as follow :

ISLANDS.	In what waters.	Belonging to	Sq. miles.
Great Britain.....	Atlantic.....	Great Britain.....	84,088
Iceland.....	Atlantic.....	Denmark.....	89,545
Nova Zembla.....	Arctic.....	Russia.....	85,164

Islay.....	Atlantic.....	Great Britain.....	273
Corfu.....	Mediterranean.....	Greece.....	273
Ringvadsee.....	Atlantic.....	Norway.....	273

The length of the principal rivers (in English miles), and the area of their basins (in square miles), are as follow :

RIVERS.	Length.	Area of basin.
Volga.....	1,973	563,802
Danube.....	1,528	815,436
Dnieper.....	1,061	208,462
Don.....	973	166,127
Dwina.....	357	141,077
Petchora.....	919	127,225
Neva.....	34	111,517
Rhine.....	708	75,796
Vistula.....	595	73,905
Elbe.....	611	55,841
Loire.....	543	46,755

The lakes of Europe cover an area of 84,829 square miles—that is, about 2 per cent of the total area of the continent. Of this number, 83,585 square miles are on the mainland and 1,244 square miles on the islands. The area covered by lakes in each country is as follows :

COUNTRIES.	On mainland.	On islands.	Total.
Russia.....	58,660	106	58,766
Sweden.....	14,276	18	14,294
Norway.....	8,951	...	8,951
Germany.....	2,198	...	2,198
Great Britain.....	...	1,011	1,011
Italy.....	775	89	814
Austria-Hungary.....	708	...	708
Turkey.....	696	...	696
Roumania.....	589	...	589
France.....	580	...	580
Switzerland.....	488	...	488
Portugal.....	201	...	201

Lough Neagh, in Ireland, is not enumerated above, as not being on the Continent. It contains 153 square miles, and ranks twenty-sixth in the list of lakes of Europe.

Among the most important sea-basins, that of the Caspian embraces 724,571 square miles. It is followed closely by that of the Baltic, with 671,818 square miles. The basin of the Black Sea contains 621,946 square miles; that of the Arctic Ocean, including the White Sea, 494,272 square miles; of the Atlantic, 354,772 square miles; of the Mediterranean, 236,889 square miles; of the Sea of Azov, 201,467 square miles; of the North Sea, 195,280 square miles; of the Adriatic, 91,522 square miles; and of the Sea of Marmora, 1,636 square miles.

The areas of the seas of Europe are estimated as follow, by General Strelbitzky:

SEAS.	Area inclusive of islands.	Area exclusive of islands.
Mediterranean, inclusive of the Jonian Sea and the Grecian Archipelago.....	975,008	915,749*
Adriatic.....	52,216	50,918
Marmora.....	4,497	4,427
Black.....	163,712	163,691
Azov.....	14,520	14,479
Baltic, inclusive of Cattegat and Skager Rack.....	184,496	171,743
North Sea.....	207,037	204,550
White Sea.....	82,472	82,281
Total.....	1,618,958	1,557,582

\* The figures given for the islands of the Mediterranean in another part of this article are 82,522 square miles. But this embraces the islands belonging to Europe only. This sea also contains 6,743 square miles of islands belonging to Asia and Africa, making a total of 89,265 square miles of islands in the Mediterranean.

† As the North Sea has no natural boundaries, geographers are forced to fix arbitrary ones. Those assumed by General

The Baltic, of all the seas of Europe, possesses the longest coast-line. The length of its coasts is 11,833 miles, of which Russia and Sweden possess nearly equal parts, 4,184 miles for the former and 5,731 miles for the latter. Germany possesses 1,366 miles, and Denmark 552 miles. The coast-line of the Mediterranean is not much less than that of the Baltic, being 11,272 miles long, of which number, however, 6,351 miles only belong to Europe. This number is divided as follows among the different European states: Greece, 1,841 miles; Turkey, 1,412 miles; Italy, 1,472 miles; Spain, 1,078 miles; France, 539 miles; Great Britain, 9 miles. The Adriatic has a coast-line of 2,396 miles, of which 1,243 miles belong to Austria, 874 miles to Italy, 249 miles to Turkey, and 30 miles to Montenegro. The European coast-line of the Black Sea is 1,776 miles long, of which 1,249 miles are in Russia, 376 miles in Turkey, and 151 miles in Roumania; that of the Caspian is 2,094 miles, and that of the Sea of Marmora 252 miles. The Sea of Azov has a circumference of 913 miles. The North Sea has a coast-line of 4,418 miles, of which 3,033 miles belong to Norway, 647 miles to the Netherlands, 460 miles to Germany, 178 miles to Denmark, 53 miles to Belgium, and 47 miles to France. On the Atlantic, Europe has a coast-line almost equal in length to that on the Baltic, in all 11,724 miles, of which 7,104 miles belong to Norway, 2,265 miles to France, 1,579 miles to Spain, and 776 miles to Portugal. The Arctic Ocean and the White Sea together have a coast-line of 6,542 miles, of which 5,632 miles are in Russia and 910 miles in Norway. The entire coast-line of the different countries of Europe we find to be as follows:

COUNTRIES.	Miles.	COUNTRIES.	Miles.
Sweden and Norway.....	16,775	Portugal.....	776
Russia.....	14,072	Denmark.....	730
France.....	2,851	Netherlands.....	647
Spain.....	2,637	Roumania.....	151
Italy.....	2,346	Belgium.....	53
Turkey.....	2,239	Montenegro.....	30
Greece.....	1,841	Great Britain.....	9
Germany.....	1,826		
Austria-Hungary.....	1,243	Total.....	48,299

The United Kingdom, which is not included in the above, has a coast-line of 7,986 miles, of which 4,978 miles belong to Great Britain, and 3,008 to Ireland. If we add to the 48,298 miles of coast-line the boundary between Russia and Asia, 3,548 miles, we get for the entire perimeter of the continent 51,846 miles.

The area of the principal gulfs and bays of Europe is as follows:

Gulfs and bays.	Sq. miles.	Gulfs and bays.	Sq. miles.
Bay of Biscay.....	68,318	Gulf of Tarento.....	4,478
Gulf of Bothnia.....	43,276	Gulf of Tcheskaya.....	4,308
Zuyder Zee.....	16,583	Gulf of Riga.....	2,910
Gulf of Finland.....	11,441	Gulf of Venice.....	2,509
Gulf of Lyons.....	6,592	Gulf of Salonica.....	2,789
Gulf of Onega.....	6,827		

Strelbitzky are as follow: On the west, the Strait of Dover, the eastern coast of Great Britain, the Orkney Islands, and the Shetland Islands; on the north, a straight line passing from the northern point of the Shetland Islands to the peninsula of Stadland, on the western coast of Norway; on the east, the coast of Norway to the Naaze, and from this point to Nissum Flord, on the western coast of Jutland; and, on the south, the continent of Europe to the Strait of Dover.

The narrowest strait is the Bosphorus, the width of which at Constantinople is about 550 yards. The Little Belt, between the Island of Fünen and Jutland, is 880 yards wide. In the Dardanelles the European shore is three quarters of a mile distant from Asia. The sound between Sweden and Zealand has a width of  $1\frac{1}{2}$  mile. The Calmar Sound, between Sweden and the Island of Oeland, is nearly 2 miles wide; the Strait of Messina, 2 miles; that of Jongarsky Schær, between the Island of Vaigats and Russia, nearly  $2\frac{1}{2}$  miles; that of Yenikale 2.6 miles; Pentland Firth, between Scotland and the Orkney Islands, 4.3 miles. The Strait of Bonifacio, between Corsica and Sardinia, has a width of 7 miles; the Great Belt, between Fünen and Zealand, a width of 10 miles; and the North Channel, between Ireland and Scotland, a width of 12 miles. The Strait of Gibraltar has a width of 20.4 miles at the fortress, but its least width is 10.5 miles. The Strait of Kara, between Nova Zembla and Vaigats, is 23.8 miles wide, the English Channel 25 miles, the Mineh 26.5 miles, the Strait of Taranto 33.6 miles, and St. George's Channel 48 miles.

EVANGELICAL ASSOCIATION. The following is a summary of the statistics of the Evangelical Association, as they are published in the "Christian Family Almanac" for 1883:

CONFERENCES.	Itinerant preachers.	Churches.	Members.
East Pennsylvania.....	69	1914	14,867
Central Pennsylvania.....	75	1954	12,055
Erie.....	31	40	2,998

Number of Sunday-schools, 2,007, with 22,126 officers and teachers, and 133,361 scholars; number of baptisms during the year, 1,414 of adults, and 8,485 of children; number of local preachers, 619; probable value of churches, \$3,439,502; number of parsonages, 475, having a probable value of \$480,161. Amount of "conference contributions," \$5,641; of contributions for missions, \$100,655; of contributions for the Sunday-School and Tract Union, \$2,512. The tables show an increase of 3,156 members during the year. The mission in Japan returns 1 itinerant preacher, 1 local preacher, 2 chapels, 3 regular preaching-places, 51

native members, 117 scholars and 15 officers and teachers in four Sunday-schools, 72 scholars in two day-schools, and, during the year, 26 baptisms of adults, and 1 infant baptized. The church has a publishing house at Cleveland, Ohio, where one English and one German general religious paper and papers for children and Sunday schools in both languages are published; and two papers are published at Stuttgart, Germany. The Ebenezer Orphan Institute, Flat Rock, Ohio, cares for children till they are sixteen years old.

EXPLOSIONS, BOILER. EXPERIMENTS OF D. T. LAWSON.—In the "Annual Cyclopædia" of last year an account was given of the experiments of Mr. Daniel T. Lawson upon the explosion of boilers under conditions which have heretofore been considered as insuring safety. Since the writing of that account, Mr. Lawson has made further tests to demonstrate the value of his improvement in the construction of boilers. The matter was considered sufficiently important by the United States authorities to warrant the appointment of commissioners to witness and report upon the tests. These reports, indorsing very fully both Mr. Lawson's theory of the phenomenon and his improvement in construction, are given below, and furnish sufficient information of the subject to enable the public to judge of it:

PITTSBURG, PA., March 23, 1882.

Hon. Charles J. Folger, Secretary United States Treasury, Washington, D. C.

SIR: In an official letter from the Supervising Inspector-General of Steam-Vessels, dated Washington, D. C., February 10, 1882, we were informed of our appointment by you to witness and report upon experiments to be made at Munhall, near Pittsburg, Pa., by Mr. D. T. Lawson, illustrating his theory of steam-boiler explosions. In accordance with these instructions, we proceeded to the scene of the experiments, February 14, 1882, three days prior to the first test, for the purpose of making a careful examination of the form, construction, and dimensions of the boilers, and to ascertain the thickness and tensile strength of the plates used in their construction.

We found two cylindrical boilers, five feet and nine inches in length and thirty inches in diameter, one of which was a plain cylindrical boiler without flues or tubes, with an iron rod one inch in diameter, which served as a stay or brace, running through the center and fastened at either head by means of nuts.

The thickness of the shell was three sixteenths of an inch, and the material was iron, with a tensile strength of 61,449 pounds per square inch of section. Two plates were used in the construction of the shell, with the longitudinal seams on opposite sides above the fire-line. The heads were made of the same material as that of the plates in the shell, but were three eighths of an inch in thickness.

The other boiler was a duplicate of the above-described boiler, with the following exceptions: 1. A man-head was put in one of its heads, necessitated by the manner in which the boiler was constructed. 2. An iron plate, three sixteenths of an inch in thickness, was flanged around its edges, and riveted along the entire length of both sides of the shell and across the heads on the inside of the boiler. The side flanges contained seventy-four five-eighths rivets each, and those across the heads contained thirteen five-eighths rivets each. The plate was semicircular in form and attached to the sides of the shell about the center, and curving upward to within eight inches of the top

of the boiler. This plate was perforated with holes three sixteenths of an inch in diameter, at intervals of eight inches, for the purpose of admitting the steam from the water below gradually to the steam-space above. This plate is Mr. Lawson's invention, and he claims that it will prevent concussion in the boiler when the steam is drawn off suddenly by opening the throttle-valve, or suddenly cutting it off from the cylinder, and thus insure greater safety in the management of steam-boilers.

The boilers used in making these experiments were manufactured expressly for that purpose, and had never been used before. The first boiler placed in position for the test was the one containing the plate, or "diaphragm," as it is called. To this boiler was attached a three-and-a-half-inch steam-pipe, sixteen feet in length, with a discharge-valve attached, sixteen feet from the boiler. A steam-pipe four feet in length—including two elbows—and three and a half inches in diameter, formed a connection between the valve and a cylinder, the diameter of which was eight inches and length four feet.

A steam-gauge, with a pipe twelve feet in length, was placed on the inside of a bomb-proof. From the inside of this bomb-proof the discharge-valve was operated by means of ropes. Fire was placed under the boiler, with nineteen inches of water to start with. When steam was generated, the discharge-valve was suddenly opened at certain intervals, discharging the steam into the cylinder. These operations were continued until the pressure in the boiler had reached 225 pounds to the square inch, when the discharge-valve was opened, and the material forming the joint between one of the cylinder-heads and the cylinder blew out. The discharge-valve, at the same time, proved too weak, and began leaking so badly that the test had to be abandoned. This ended the first test, February 17, 1892. The second test took place March 7, 1892. This test was made with the plain cylindrical boiler, and the discharge-valve, steam-pipe, and all other outside attachments substantially the same as they were with the other boiler during the first test. A stronger discharge-valve, however, was employed, as were also two new steam-gauges. The latter were manufactured expressly for these tests by William Kirkup & Son, of Cincinnati, Ohio. Fire was started under the boiler, and steam raised slowly. At 12.02 p. m. the steam-gauge indicated 75 pounds. In four minutes thereafter the pressure had increased 25 pounds. At this point the discharge-valve was opened, and the needle of the gauge fell five pounds, but immediately rose again to 100 pounds. From this point the pressure increased to 125 pounds in six minutes, when an attempt was made to raise the valve, but the line broke; the furnace-door was thrown open, and the fire drawn. The line was repaired, and the lever attached to the valve was lengthened, when the boiler was again fired up. At 75 pounds pressure the valve was raised, and the needle of the gauge showed the vibrations recorded in the following table:

Pressure at which the discharge-valve was raised.	Vibrations of needle of gauge below pressure in first column.	Vibrations of needle of gauge above pressure in first column.
Pounds.	Pounds.	Pounds.
75	3	2
100	4	3
110	5	5
120	8	5
165	15	10
175	19	7
185	15	15
200	12	12
210	20	12
220	20	12

At 220 pounds a leak, which had previously started around the stay-bolt in the forward head of the boiler, became so bad that the test had to be discontinued until the necessary repairs could be made. Upon examination it was discovered that the hole in the cen-

ter of the head through which the stay-bolt passed had been enlarged with a drift-pin, causing the iron in the head to crack in three places, beginning at the edge of the hole and running out into the body of the head. The defects were repaired, and on the following day, March 8th, the test was resumed, with the result as shown in the following table:

Pressure at which the discharge-valve was raised.	Vibrations of needle of gauge below pressure in first column.	Vibrations of needle of gauge above pressure in first column.
Pounds.	Pounds.	Pounds.
100	5	5
125	12	5
130	15	7

At 130 pounds a leak in the back head of the boiler, which had started around the stay-bolt, checked the draught to such an extent as to render further efforts to increase the pressure futile.

March 9th the boiler was repaired and put in good order. On the following day, March 10th, the experiments were resumed with 204 inches of water in the boiler, 54 inches above the fire-line. Steam was generated slowly, but, contrary to our advice, the pressure was run up to 200 pounds before the discharge-valve had been attempted to raise, and when an attempt was made to raise it, it was found that it had become fast to the seat; the lever attached to it broke, and practically ended the test. The steam, however, ran up to 275 pounds, when it began falling slowly, until the pressure reached a point of safety, when the fire was drawn and the boiler allowed to cool off.

March 20th, the experiments were resumed. This time the boiler with Mr. Lawson's appliance was used. A steam-gauge was attached to the boiler above and one below the diaphragm. The boiler contained 18 inches of water. Steam was generated slowly, and when the pressure had reached 50 pounds, operating the discharge-valve began with the following results:

Steam pressure at which discharge-valve was raised.	Steam-gauge above the diaphragm.		Steam-gauge below the diaphragm.	
	Needle fell below.	Needle rose above.	Needle fell below.	Needle rose above.
Pounds.	Pounds.	Pounds.	Pounds.	Pounds.
50	7	7	3	00
80	10	7	4	00
100	12	7	5	3
125	15	15	8	4
150	20	20	8	7
175	15	23	10	10
200	20	20	15	00
225	30	20	12	00
230	40	30	10	00
250	25	20	10	00
275	30	25	15	00
300	40	35	15	00

When the pressure in the boiler reached 300 pounds to the square inch, it was unanimously decided that the boiler had been sufficiently tested, as we intended to cut out the diaphragm and make the final test with the same boiler. The discharge-valve was then opened and the steam allowed to escape; the fire was drawn, and when the boiler had cooled off sufficiently an examination was made. It was found that the water had been reduced to 11 inches, or 4 inches below the fire-line. The rivets, seams, and all the other parts of the boiler were critically examined, and no strain, rupture, or any other weakness, was discovered. The diaphragm was then cut out, leaving the flanges riveted to the sides of the shell and across the heads, with about three inches of the plate of which the diaphragm was constructed. The boiler was then placed in position for the final test, with 22 inches of water, 7 inches above the fire-line. When steam was raised, the discharge-valve was operated, with the following results:

Steam-pressure at which discharge-valve was raised.	Steam-gauge attached to the boiler in the steam-space.		Steam-gauge attached to the boiler in the water-space.	
	Needle fell below.	Needle rose above.	Needle fell below.	Needle rose above.
Pounds.	Pounds.	Pounds.	Pounds.	Pounds.
100	3	0	3	0
125	2	0	8	0
150	5	0	5	0
175	4	2	8	2
200	5	0	5	0
210	3	0	8	0
225	5	0	8	0
235	Exploded.	..	..	..

When the discharge-valve was opened at 235 pounds pressure it caused an instantaneous explosion of the boiler. An examination of what was found of the wreck proved that the boiler let go at no particular place first, but that it simply blew into fragments at one and the same time. The iron which was found was torn and twisted into every conceivable shape—strips varying in size from half an inch to one inch in width, and from three inches to two feet in length, were found in every direction.

This boiler, according to the tensile strength of the iron, would have carried a pressure of 430 pounds before it would have ruptured, and when it exploded, although it had but 235 pounds pressure to the square inch in it prior to the opening of the discharge-valve at the moment of explosion, there must have been a force at least equal to 430 pounds to the square inch exerted.

What seemed most singular about this explosion was that the boiler did not tear at the seams, the weakest parts, but the tearing was pretty much all done at the solid parts of the iron, and in no particular direction.

In making the foregoing report, we have carefully refrained from obtruding any theories of our own. We have simply confined ourselves to the facts as they occurred, preferring to leave the world to draw its own conclusions.

Respectfully submitted:

JOHN FEHRENBATCH,  
U. S. Supervising Inspector of Steam-Vessels,  
GEORGE H. ATKINSON,  
U. S. Inspector of Boilers of Steam-Vessels,  
ALONZO S. BATCHELOR,  
U. S. Assistant Inspector of Boilers of Steam-Vessels.

Having been requested by the Secretary of the Treasury to make a supplemental report, giving their opinion of Mr. Lawson's theory of boiler-explosion, the commissioners did so, indorsing not only the theory in question, but the mode of boiler-construction devised by Mr. Lawson. In this report the commissioners say:

As to the merits of the claims made for Mr. Lawson's theory of steam-boiler explosions, in our opinion their validity was fully established. . . . We are convinced that the attachment to a boiler of a diaphragm such as, or similar to, the one employed while making the experiments, will, in a great measure, remove the dangers which now surround the management and use of steam-boilers. A boiler with such an apparatus attached is safer, for the reason that no concussions can take place in it. Aside from this it strengthens the boiler, and in addition thereto it produces dry steam, a great desideratum in the running of steam-engines. The experiments made have not proved the theory, held by many, that low water is the cause of boiler-explosions, to be correct.

## F

**FARMS AND LIVE-STOCK IN THE UNITED STATES.** The statistics of the number of farms in the States and Territories of

the United States, with the live-stock upon them, are shown by the following returns of the census of 1880:

### FARMS.

The United States .....	4,008,907	2,659,985	2,044,077				

The great increase in the number of farms from 1870 to 1880 in the Northern, Western, and Pacific States, and the Territories, is ex-

plained by the rapid settlement of those regions during the past decade. The great increase in the late slave States, especially in the

cotton region, is accounted for by the subdivision of the large plantations of ten and twenty years ago, by reason of social and industrial changes consequent on the war, and also, in the case of Florida, Arkansas, and Texas, by immigration.

The average size of farms in 1880 was 134 acres; in 1870, 153 acres; in 1860, 199 acres. The number of farms of specified sizes in the United States in 1880, as compared with 1870, was as follows:

SIZE.	1870.	1880.
Under 3 acres.....	6,875	4,852
3 and under 10.....	172,921	184,889
10 and under 20.....	294,607	254,749
20 and under 50.....	847,614	781,474
50 and under 100.....	754,221	1,032,910
100 and under 500.....	565,054	1,695,988
500 and under 1,000.....	15,873	75,972
1,000 and over.....	8,720	28,578

Important comparisons between 1880 and 1870 are given in the following statement:

	1870.	1880.
Total land in farms, acres.....	407,735,041	536,081,835
Improved land in farms, acres.....	188,921,099	254,771,042
Unimproved land in farms, acres.....	218,813,942	281,310,793
Percentage of unimproved to total land in farms.....	53.7	46.9
Value of farms*.....	\$9,262,808,861	\$10,197,096,776
Value of farming implements and machinery*.....	836,878,429	406,520,055
Value of live-stock*.....	1,525,276,457	1,500,464,609

The estimated value of all farm-productions (sold, consumed, or on hand) for 1879 was \$2,213,402,564.

#### LIVE-STOCK.

Horses.....	10,337,931
Mules and asses.....	1,512,932
Working-oxen.....	998,970
Milch-cows.....	12,443,593
Other cattle.....	22,488,590
Sheep.....	35,191,656
Swine.....	47,683,951

#### FINANCES OF THE UNITED STATES.

In reviewing the financial operations of the Government during the year 1882, the absence of congressional legislation affecting the national revenues is a noticeable feature; and, perhaps, the freedom of action which naturally followed has not been to the disadvantage of the nation. By a faithful administration of the laws already in force, and a judicious expenditure of the public funds with strict regard to economy, there has been realized a surplus revenue of \$145,000,000—an amount hitherto unparalleled in our history.

The receipts of the Government for the fiscal year ended June 30, 1882, were as follow:

From customs.....	\$220,410,730 25
From internal revenue.....	146,497,595 45
From sales of public lands.....	4,753,140 37
From tax on circulation and deposits of national banks.....	8,956,794 45
From repayment of interest by Pacific Railway Companies.....	840,554 37
From sinking fund for Pacific Railway Companies.....	796,271 42
From customs fees, fines, penalties, etc.....	1,843,348 00
From fees—consular, letters-patent, and lands.....	2,638,990 97
From proceeds of sales of Government property.....	314,959 85
From profits on coinage, bullion deposits, and assays.....	4,116,693 73
From Indian trust funds.....	5,705,243 22
From deposits by individuals for surveying public lands.....	2,052,806 36
From revenues of the District of Columbia.....	1,715,176 41
From miscellaneous sources.....	8,333,445 43
Total.....	\$403,525,250 28

The expenditures for the same period were:

\* In comparison of values between 1870 and 1880, it should be borne in mind that in the former year, gold was at an average premium of 25.3 per cent.

For civil expenses.....	\$18,042,386 42
For foreign intercourse.....	1,307,583 19
For Indians.....	9,736,747 40
For pensions.....	61,845,193 95
For the military establishment, including river and harbor improvements, and arsenals.....	43,570,494 19
For the naval establishment, including vessels, machinery, and improvements at navy-yards.....	15,032,046 26
For miscellaneous expenditures, including public buildings, light-houses, and collecting the revenue.....	34,539,237 50
For expenditures on account of the District of Columbia.....	2,330,548 37
For interest on the public debt.....	71,077,206 79
Total.....	\$257,981,439 57

Leaving a surplus of \$145,543,810.71.

Compared with the previous fiscal year, the receipts for 1882 have increased as follows: From customs, \$22,251,054.23; internal revenue, \$11,233,209.94; sales of public lands, \$2,551,277.20; tax on circulation and deposits of national banks, \$840,678.73; and miscellaneous, \$5,866,737.61; making a net increase in the receipts from all sources of \$42,742,957.71.

The expenditures during the same period show a decrease of \$20,343,982.30, as follows: In the naval establishment, \$654,625.40; interest on the public debt, \$11,431,534.39; and in civil and miscellaneous, \$8,257,822.51. There was an increase of \$17,612,534.28, as follows: In the military establishment, \$3,104,033.64; for Indians, \$3,222,586.31; and in pensions, \$11,285,914.33; making a net decrease in the expenditures of \$2,731,448.02.

The receipts from customs for the last fiscal year (\$220,410,730.25) were larger than ever before in the history of the Government; the nearest approach to a like amount being in 1872, when the collections from customs duties were \$216,370,286.77. The receipts from internal revenue (\$146,497,595.45) were the largest since 1870, during which year they amounted to \$184,899,756.49. The amount received from sales of public lands (\$4,753,140.37) was greater than for any year since 1856, when they amounted to \$8,917,644.93. The total net revenue (\$403,525,250.28) was larger

than for any previous year since 1870, when the aggregate receipts amounted to \$411,255,477.63. The receipts from duties on imports and internal revenue taxes have steadily increased for the past five years. In 1878 the revenue from customs amounted to \$130,170,680.20; and from internal revenue, \$110,581,624.74. During the same period the ordinary expenditures have materially decreased, and as the result of successfully refunding a very large portion of our national debt, the annual interest charge has been reduced \$37,294,362.

The following is a statement showing the net ordinary receipts and expenditures of the Government by calendar years, for 1881 and 1882:

	1881.	1882.
<b>RECEIPTS.</b>		
Customs.....	\$207,757,504 62	\$225,786,130 84
Internal revenue.....	143,531,925 41	145,783,153 82
Sales of public lands....	3,260,824 23	5,718,446 46
Tax on circulation of banks.....	8,497,545 09	9,161,133 23
Miscellaneous.....	19,080,484 87	22,997,737 91
<b>Total.....</b>	<b>\$382,078,533 72</b>	<b>\$409,446,612 26</b>
<b>EXPENDITURES.</b>		
Civil and miscellaneous..	\$58,213,142 44	\$64,871,480 64
War.....	42,774,998 80	44,996,957 09
Navy.....	14,768,855 93	15,001,608 90
Indians.....	6,865,307 63	10,000,099 13
Pensions.....	53,700,121 50	55,363,591 73
Interest.....	75,989,940 96	63,775,410 95
<b>Total.....</b>	<b>\$254,817,867 26</b>	<b>\$254,009,448 44</b>
<b>Surplus revenue ....</b>	<b>\$127,261,166 46</b>	<b>\$155,437,163 82</b>

As compared with the preceding calendar year, the receipts for 1882 have increased \$27,368,078.54, as follows: From customs, \$18,028,626.22; internal revenue, \$2,251,233.41; sales of public lands, \$2,457,622.23; tax on circulation and deposits of national banks, \$663,293.14; and miscellaneous, \$3,967,303.54.

The expenditures show a net decrease of \$807,918.82, owing to the large reduction in the amount required for the payment of interest on the public debt.

Comparing the fiscal year 1881 with the previous year, 1880, the receipts increased as follows: In customs revenue, \$11,637,611.42; internal revenue, \$11,255,011.59; in tax on circulation and deposits of national banks, \$1,101,144.28; in miscellaneous, \$5,359,133.81; making a total increase of revenue over previous year of \$29,352,901.10. The expenditures show a net decrease over previous year of \$6,930,070.19, the principal item of decrease being that of interest on the public debt, \$13,248,833.93.

Of the amount of surplus revenue for the year, \$14,637,023.93 remained in the Treasury at the close of the year. The remainder, \$85,432,381.05, was applied to the purchase or redemption of obligations of the United States, all of which were interest-bearing, except the comparatively small amount of \$109,001.08 of fractional notes.

The condition of the Treasury at the beginning of the present calendar year, as compared with that of 1882 on the same day, may be stated as follows:

STATEMENT SHOWING THE ASSETS AND LIABILITIES OF THE UNITED STATES TREASURY ON THE  
1ST DAY OF JANUARY, 1882 AND 1883.

	January 1, 1882.	January 1, 1883.

<b>Total.....</b>	<b>\$333,304,971 98</b>	<b>\$406,218,728 32</b>

The increase in the receipts from duties on imports derived from sugar, wool, iron and steel, silk, cotton, and spirits, as compared with the preceding year, is shown by the following table:

SOURCES.	Fiscal year 1881.	Fiscal year 1882.	Increase.
Sugar, melada, and molasses.....	\$47,977,187	\$49,198,312	\$1,221,175
Wool and its manufactures.....	27,285,624	29,253,016	1,967,392
Iron and steel, and manufactures thereof.....	21,462,584	24,175,547	2,713,013
Manufactures of silk.....	19,038,665	22,638,187	3,594,472
Manufactures of cotton.....	10,825,115	12,227,108	1,401,988
Wines and spirits.....	6,469,643	6,771,483	301,840

The increase in the receipts from internal revenue for the same period has been as follows:

SOURCES.	Fiscal year 1881.	Fiscal year 1882.	Increase.
Spirits.....	\$67,153,974	\$63,873,408	\$2,719,434
Tobacco.....	42,854,991	47,391,988	4,536,997
Fermented liquors.....	13,700,241	16,153,920	2,453,679
Banks and bankers.....	3,762,208	5,253,458	1,491,250
Miscellaneous.....	7,758,496	7,850,497	92,001

The surplus revenue, amounting in the fiscal year 1882 to \$145,543,810.71, and for the calendar year to \$155,437,163.82, could only be applied under existing laws to the reduction of the outstanding principal of the national debt.

The changes which have taken place during the year ended December 31, 1882, are shown in the following statement of the condition of the public debt at the beginning and close of the year.

CHARACTER.	December 31, 1881.	December 30, 1882.
Bonds at 4½ per cent.....	\$250,000,000 00	\$250,000,000 00
Bonds at 4 per cent.....	738,772,550 00	738,950,550 00
Bonds at 3½ per cent.....	551,156,800 00	99,326,200 00
Bonds at 3 per cent.....	675,250 00	289,563,950 00
Refunding certificates, 4 per cents.....	14,000,000 00	404,750 00
Navy pension fund.....	14,000,000 00	14,000,000 00
Interest accrued on the above loans.....	14,814,377 85	12,067,188 54
Debt on which interest has ceased.....	11,528,265 26	14,887,015 26
Interest on matured debt.....	714,955 81	446,514 83
Demand and legal-tender notes.....	346,740,936 00	346,740,811 00
Clearing-House certificates.....	9,590,000 00	9,585,000 00
Gold certificates.....	5,188,120 00	61,619,840 00
Silver certificates.....	68,675,230 00	72,348,660 00
Fractional currency.....	7,075,926 92	7,022,074 17
Unclaimed Pacific Railway interest.....	7,256 51	5,339 96
Total.....	\$2,013,869,697 85	\$1,920,467,693 31
Less cash in the Treasury.....	253,377,980 76	312,924,016 47
Net debt.....	\$1,765,491,717 09	\$1,607,543,676 84

As will be seen by the above statement, the principal of the public debt bearing interest has been reduced during the last year \$162,289,150; the total principal has been reduced \$95,884,727.75. The reduction of the total debt, less cash in the Treasury, during the same period was \$157,948,040.25, with a corresponding reduction in the annual interest charge of \$7,127,902.50.

The refunding operations of the Government for 1882 were limited to the exchange, under authority of section 11 of an act approved July 12, 1882, of the "continued 3½ per cents" issued by Secretary Windom, for a like amount of 3 per cent bonds.

Soon after the opening of the first session of the Forty-seventh Congress, a bill was introduced in the Senate by Mr. Sherman, authorizing the issue of \$300,000,000, in 3 per cent bonds, payable at the pleasure of the United States after the 1st of January, 1887, the money received therefor to be applied solely to the redemption of bonds of the United States bearing 3½ per cent interest. The debate on this bill took a very wide range, extending through a period of several weeks. Although its oppo-

nents willingly admitted that the Government was now in a position to dictate terms to its creditors, and to float its public debt at the lowest rate of interest at which any nation had been able to borrow money, yet the rate proposed, was so low, that the measure, even if adopted, would ultimately prove to be a failure. While admitting that our credit was established upon a firm basis, and stood unrivaled in the markets of Europe; that our bonds were in demand both at home and abroad by investors who prefer a perfectly safe investment to one of a speculative character; that our immense resources and financial vigor, as shown by the steady reduction of the public debt and the rate of interest at each successive funding operation, was of itself sufficient to prove that our securities had no equal; notwithstanding these facts, a strong effort was made to defeat the bill by incorporating an amendment providing that these 3 per cent bonds should be the *only* bonds receivable as security for national-bank circulation, or as security for the safe-keeping and prompt payment of the public money deposited with such banks, so far as the whole amount issued would enable the

banks to give such security. The bill as amended passed the Senate February 3, 1882. No action having been taken by the House up to a late date, the provisions of the bill were attached by the Senate to the act providing for the extension of the charters of national banking associations, and became a law July 12, 1882. Section 11 of this act reads as follows:

That the Secretary of the Treasury is hereby authorized to receive at the Treasury any bonds of the United States bearing three and a half per centum interest, and to issue in exchange therefor an equal amount of registered bonds of the United States of the denominations of fifty, one hundred, five hundred, one thousand, and ten thousand dollars, of such form as he may prescribe, bearing interest at the rate of three per centum per annum, payable quarterly at the Treasury of the United States. Such bonds shall be exempt from all taxation by or under State authority, and be payable at the pleasure of the United States: *Provided*, That the bonds herein authorized shall not be called in and paid so long as any bonds of the United States heretofore issued bearing a higher rate of interest than three per centum, and which shall be redeemable at the pleasure of the United States, shall be outstanding and uncalled. The last of the said bonds originally issued under this act, and their substitutes, shall be first called in, and this order of payment shall be followed until all shall have been paid.

It will be noticed that these bonds were to be issued redeemable at the pleasure of the United States, but not until after all bonds bearing a higher rate of interest, and thus redeemable, are redeemed or called; and they are to be called for payment in an inverse order to that in which they are issued; those last dated and numbered being the first to be redeemed.

Under this authority the exchange of "3½ per cent continued bonds" began August 1st, and continued until September 20th, when operations were temporarily suspended in order to allow the preparation of the schedules and checks for the dividend due November 1st on the 3½ per cents which had not been exchanged, as well as upon the new issue of 3 per cents. Up to the date of the suspension of operations, 3½ per cents to the amount of \$259,370,500 were exchanged for a like amount of 3 per cents. The interest on the bonds surrendered was adjusted to August 1, 1882, and the 3 per cent bonds exchanged therefor carried interest from that date. The total amount of 3 per cent bonds issued to December 30, 1882, was \$289,563,950. The reduction in the annual interest charge by reason of these exchanges is \$1,447,819.75.

The following is a statement of the calculated average rates of interest to investors in the 4½ and in the 4 per cent securities of the United States, at their market values during the months of January and July of each year, from 1877 for the 4½ per cents, and from 1878 for the 4 per cents, to and including July, 1882, as prepared by Professor E. B. Elliott, Actuary of the Treasury Department.

It will be seen that the decline has been gradual from 4.425 to about 2.895.

YEAR.	Four and a half per cents of 1891.		Four per cents of 1907.	
	January.	July.	January.	July.
	Per cent.	Per cent.	Per cent.	Per cent.
1877...	4.425	4.380		
1878...	4.218	4.162	4.027	4.022
1879...	4.011	3.912	4.029	3.891
1880...	3.822	3.527	3.756	3.502
1881...	3.198	2.885	3.274	3.074
1882...	2.828	2.895	2.998	2.900

But once before in the history of the Government has its revenue so far exceeded its expenditure as to cause any feeling of anxiety in the minds of its financial officers as to the best disposition to be made of the surplus. In 1836 the country was free from debt, and during a period of unexampled prosperity, aided by a strong speculative mania for the purchase of the public lands, the surplus revenue was very large, too much so to be allowed to remain in the Treasury. On June 23, 1836, an act was passed which provided that, at the commencement of the following year, the surplus revenues in the Treasury in excess of \$5,000,000 should be distributed among the several States according to their respective representation in the Senate and House of Representatives. The amount so distributed was \$28,104,864.91. The act provided for a distribution in four equal installments, but the fourth installment was never paid over. Within a brief period the condition of affairs was changed. The good times of 1835-'36 were succeeded in 1837 by the most extraordinary depression and panic. At the close of the year 1837 it was not only impossible to pay to the States the fourth installment of the surplus, but even to meet the current expenses of the Government from its ordinary revenues. (See INDEBTEDNESS OF THE STATES, page 398.)

At the present time, and under existing laws, we have no reason to fear such a result from any attempt to dispose of the rapidly increasing surplus revenues of the Government. All the circumstances are different. We have a large outstanding debt, and the surplus over and above the amount required for the payment of the ordinary expenditures of the Government may well be applied to the extinguishment of that debt, until Congress shall provide by suitable legislation for a reduction of taxation, by a revision of the tariff laws and a corresponding change in our internal revenue system of taxation.

The Secretary of the Treasury, in his annual report for 1881, called the attention of Congress to this subject, and suggested the propriety of new legislation, looking to a reduction of the surplus revenue by a reduction of taxation. He said:

"It is a matter of gratulation that the business of the country so thrives as to endure the onerous taxation that is upon it, and yet grow in volume, and apparently in profits, and yield to the Government a surplus over its needs. The result upon the public revenue is to em-

barrass this department in disposing of the surplus in lawful way, and with regard to economy. While it is asserted that there is stringency in the money market, and that the business community is in straits, the call of this department for millions of bonds is slowly heeded, and its offer to purchase bonds is not in full accepted. There is another way in which to dispose of the surplus, namely, to enter the markets and buy bonds at the current rates. Calculations of experts show that, at the premium that now rules upon the 4 and 4½ per cent bonds, this could not be done without a loss to the Treasury, which it is of doubtful propriety to make. And it is almost certain that an announcement of a purpose so to do would enhance the market value of those bonds. Meanwhile the daily receipts from the community by the Treasury continue, the surplus over its needs increases, and money lies idle. It seems that the plan most just, for giving relief, is to reduce taxation, and thereby diminish receipts and surplus.

"The rapid reduction of the public debt and the increase of the surplus in the Treasury present the question to Congress whether there should not be a reduction in the taxation now put upon the people. It is estimated that, if the present ratio of receipt and expenditure is kept up, the public debt now existing may be paid in the next ten years. In view of the large sum that has been paid by the present generation upon that debt, and of the heavy taxation that now bears upon the industries and business of the country, it seems just and proper that another generation should meet a portion of the debt, and that the burdens now laid upon the country should be lightened. It is to be considered, too, whether the seeming affluence of the Treasury does not provoke to expenditure larger in amount than a wise economy would permit, and upon objects that would not meet with favor in a pinched or moderate condition of the Federal Exchequer. In some quarters there is already talk of an overflowing Treasury, and projects are put forth for lavish expenditure, not only to the furtherance of public works of doubtful legitimacy and expediency, but in aid of enterprises no more than *quasi*-public in character. Can a Government be justly said to have an overflowing Treasury when there is an outstanding debt against it greater than it could pay if lawfully presented, and when its means of payment in the future must be taken from its denizens by burdensome taxation? And is it a beneficial exercise of governmental power to raise money by taxation in greater sums than the lawful demands upon the Government require, when those demands are of themselves a heavy burden upon the industry and business of the country?"

And again, in his annual report for 1882, he said: "The Treasury Department was created by act of Congress, chapter xii, of the year 1789. By the second section it was made the duty of

the Secretary 'to digest and prepare plans for the *improvement* of the revenue.' The word *improvement* meant enlargement. The need was for more revenue, and the lack was of subjects from which it might be taken. In that sense that duty is now without care. The times have changed. What now perplexes the Secretary is not wherefrom he may get revenue and enough for the pressing needs of the Government, but whereby he shall turn back into the flow of business the more than enough for those needs that has been drawn from the people.

"It has not often occurred in public financial history that embarrassment has arisen through superabundance of revenues. The condition of the country in that respect, while it illustrates its almost boundless resources, and establishes its credit beyond a question, presents difficulties of grave character.

"The accumulation in the Treasury of a large surplus, which must occur unless immediate measures are enacted for a reduction of the revenues, is not to be placidly contemplated, and the question confronts us, In what manner may it best be prevented?"

Soon after the beginning of the first session of the Forty-seventh Congress, a bill was introduced by Senator Morrill, of Vermont, authorizing the appointment of a commission to investigate the subject of the tariff and internal revenue laws. (See CONGRESS, UNITED STATES; also TARIFF REVISION.) A long and tedious debate followed, resulting in the passage of an act, approved May 15, 1882, creating a commission to consist of nine members, to be appointed by the President, from civil life, subject to confirmation by the Senate, their duties, as prescribed in the third section of the act, being as follow:

It shall be the duty of said commission to take into consideration and to thoroughly investigate all the various questions relating to the agricultural, commercial, mercantile, manufacturing, mining, and industrial interests of the United States, so far as the same may be necessary to the establishment of a judicious tariff, or a revision of the existing tariff, upon a scale of justice to all interests, and for the purpose of fully examining the matters which may come before it. Said commission, in the prosecution of its inquiries, is empowered to visit such different portions and sections of the country as it may deem advisable.

In compliance with the fourth section of the act authorizing their appointment, the commission submitted their report to Congress on the 4th of December, 1882, accompanied with a proposed schedule of duties which they recommended to the consideration of Congress as the basis of a new tariff bill.

As showing the motives which governed the commission in making their investigations on this all-important subject—more seriously affecting the revenues, for at least several years to come, than, perhaps, any other which is likely to come before the present Congress—the following extracts from their report are of more than ordinary interest:

The practical question presented to the commission is that of reconciling the interests of revenue, including the considerations of its sufficient maintenance or possible reduction, with justice to the interests of the nation involved in the preservation of its industries and the security of its labor. The legislation to be recommended is for the present, and not for posterity, which must meet its own emergencies, and the determination of this question involves considerations of expediency, not the least of which is, that the measures recommended be such as shall be acceptable to the country and its representatives in Congress. It must accept the facts that discrimination in the imposition of import duties, a discrimination for the most part positive and avowed, and always, at least, with an incidental reference to the defense of the national industries, has been the policy of the country for generations; that in consequence of this policy thousands of millions of dollars have been invested in special pursuits; that the whole business of the country has been adjusted to the conditions of things growing out of this policy, and is inseparably identified with it; and that a subversive or radical change in the present economic system would throw labor out of employment, ruinously depreciate values, and create a general industrial and commercial disaster.

Early in its deliberations the commission became convinced that a substantial reduction of tariff duties is demanded, not by a mere indiscriminate popular clamor, but by the best conservative opinion of the country, including that which has in former times been most strenuous for the preservation of our national industrial defenses. Such a reduction of the existing tariff the commission regards not only as a due recognition of public sentiment and a measure of justice to consumers, but one conducive to the general industrial prosperity, and which, though it may be temporarily inconvenient, will be ultimately beneficial to the special interests affected by such reduction. No rates of defensive duties, except for the establishment of new industries, which more than equalize the conditions of labor and capital with those of foreign competitors, can be justified. Excessive duties, or those above such standard of equalization, are positively injurious to the interest which they are supposed to benefit. They encourage the investment of capital in manufacturing enterprise by rash and unskilled speculators, to be followed by disaster to the adventurers and their employes, and a plethora of commodities which deranges the operations of skilled and prudent enterprise. Numerous examples of such disasters and derangements occurred during and shortly after the excessively protective period of the late war, when tariff duties were enhanced by the rates of foreign exchange and premiums upon gold. Excessive duties generally, or exceptionally high duties in particular cases, discredit our whole national economic system, and furnish plausible arguments for its complete subversion. They serve to increase uncertainty on the part of industrial enterprise, whether it shall enlarge or contract its operations, and take from commerce, as well as production, the sense of stability required for extended undertakings. It would seem that the rates of duties under the existing tariff—fixed, for the most part, during the war, under the evident necessity at that time of stimulating to its utmost extent all domestic production—might be adapted, through reduction, to the present condition of peace, requiring no such extraordinary stimulus. And in the mechanical and manufacturing industries, especially those which have been long established, it would seem that the improvements in machinery and processes made within the last twenty years, and the high scale of productiveness which has become a characteristic of their establishments, would permit our manufacturers to compete with their foreign rivals under a substantial reduction of existing duties.

The report of the commission was referred to the Committee of Ways and Means of the

House of Representatives, and in the present state of public feeling on this subject it is to be presumed that some action relative to a revision of the tariff will be taken by the present Congress.

An effort was made to reduce internal revenue taxation to the amount of \$23,000,000 per annum by the repeal of all laws imposing taxes upon the capital and deposits of national and other banks and bankers, including all stamp-taxes on bank checks, drafts, etc., together with the tax on matches and proprietary medicines, and a small reduction on cigars and cigarettes, the amount of such reduction being based upon a report from the Committee of Ways and Means of the House of Representatives. This measure, however, failed to become a law.

In his annual report to Congress for 1882, the Comptroller of the Currency reported that the number of national banks organized during the year ended November 1, 1882, was 171, with an aggregate authorized capital of \$15,767,300. Circulating notes were issued to these associations amounting to \$6,500,680. This is the largest number of banks organized in any year since 1872. Nineteen banks, with an aggregate capital of \$1,855,000, and circulation of \$1,440,800, voluntarily discontinued business during the year.

The resources and liabilities of national banks at the close of business on the 30th day of December, 1882, are stated as follows:

RESOURCES.	
Loans and discounts.....	\$1,225,889,580 22
Overdrafts.....	4,566,688 75
United States bonds to secure circulation.....	357,047,650 00
United States bonds to secure deposits.....	16,344,000 00
United States bonds on hand.....	15,492,150 00
Other stocks, bonds, and mortgages.....	66,998,620 36
Due from approved reserve agents.....	122,066,106 75
Due from other national banks.....	76,073,227 76
Due from State banks and bankers.....	18,405,748 49
Real estate, furniture, and fixtures.....	46,998,408 41
Current expenses and taxes paid.....	5,130,505 33
Premiums paid.....	16,281,815 67
Checks and other cash items.....	155,951,194 81
Exchanges for Clearing-House.....	25,344,775 00
Bills of other national banks.....	401,814 70
Fractional currency.....	
Specie, viz.:	
Gold coin.....	\$47,091,088 27
Gold Treasury certificates.....	22,651,770 00

Due to State banks and bankers.....	77,081,165 82
Notes and bills rediscounted.....	6,708,164 45
Bills payable.....	8,856,056 54
Total.....	\$2,360,793,467 09

Soon after the beginning of the first session of the Forty-seventh Congress, a bill was introduced, providing for the extension of the corporate existence of national banks, embodying the recommendations of the Comptroller of the Currency. It was subsequently reported to the House by the Committee on Banking and Currency, with several important amendments, and after a lengthy discussion passed May 30, 1882. The bill was amended in the Senate in many particulars, and passed that body June 22d, by a vote of 34 to 14, and was subsequently passed in the House July 10th. Upon the report of the conference committee the vote was yeas 110, nays 79, not voting 101, and the bill was approved by the President July 12, 1882.

The first three sections exhibit the method of procedure by which national banks whose periods of succession are about to expire can extend their charters. In brief, any such bank can, within two years previous to the date at which its corporate existence would otherwise terminate, by the vote of shareholders owning not less than two thirds of its capital stock, extend its corporate existence for twenty years from the date of the expiration of its original period of succession, and its legal status as a corporation is the same as if at the time of its original organization it had had a chartered period of forty years instead of twenty years.

Section 4 makes this view clear, enacting that the association shall preserve its identity, and be the same after extension as before.

The proviso in this section changes the law before in force, as to the jurisdiction of courts in suits by or against national banking associations. Under the old law national banks had both in suits by and against them certain rights granted by statute which placed them upon a different footing from State or private banks and bankers located in the same places; but this proviso places national banks in all suits by or against them upon the same footing as other banks and bankers, except as to suits between them and the United States, or its officers and agents.

Section 5 provides how any stockholder not assenting to the extension of the corporate existence of the bank in which he holds stock, may withdraw from such bank and secure the value of his stock. It also contains a further proviso modifying previously existing law as to the organization of new associations. Prior to the passage of this act, the stockholders of a national bank which had been placed in voluntary liquidation, could under a decision of the Attorney-General organize a new bank, taking the name of the one previously closed.

This can only be done under the present law by the unanimous consent of the stockholders of the bank previously closed; the object of this is to prevent the disregard of the rights of any of the stockholders. The provisions of section 6 relate to the retirement and issue of circulating notes to extended national banks. The design of this section is to cause all notes issued by banks after their extension to be of a new design easily distinguished from notes issued previous to extension, so that the latter may be called in and destroyed.

For the first three years after extension, as the notes of old design are redeemed, notes of the new design are issued to the bank; after three years have elapsed, the bank is required to deposit lawful money to retire such of the notes of old design as have not yet been presented for redemption. It is especially enacted that all gains which may be derived from bank-notes lost and destroyed shall accrue to the Government. Virtually this was the case before, but a specific provision now places the matter beyond controversy. By the same section, the provision that the expense of preparing plates for new circulating notes shall be borne by the banks, which had been the rule before, is made applicable to extending banks.

Section 7 obviates some difficulties which would have been encountered by banks, the corporate existence of which might expire without their stockholders having taken any action for their extension. Under the previous law as interpreted by the United States Supreme Court, there was reason to believe that a national bank after its period of succession had expired, was no longer a corporation, was legally dead, could not sue or be sued.

Under this view, the affairs of a bank in such a condition would have been left in great confusion. Its directors could not act, its property could not be sold, nor could it collect amounts due from its debtors. Its affairs would have been thrown into a condition which could only be arranged by a court of equity, or perhaps by the courts under State statutes. This section provides for a continuation of the franchise of expiring national banking associations which do not extend until such time as their affairs are finally liquidated. Under the old law, any bank, without regard to capital, could be authorized to commence business, or to continue to do business, upon a deposit of \$50,000 in bonds, without regard to the capital stock.

Thus, a bank with a capital of \$50,000 was required to deposit \$50,000 in bonds, and a bank with a capital of \$500,000 was required to do no more.

Under section 8, banks with a capital of \$150,000, or less, can now do business upon a deposit of bonds equal to a quarter of their capital. Thus, a bank of \$50,000 is required to deposit \$12,500 in bonds; of \$150,000 capital, \$37,500 in bonds. Above \$150,000 capital, \$50,000 in bonds is still the minimum required. This section also provides that the amount of

circulating notes shall not in any case exceed 90 per cent of the par value of the bonds.

Previously, also, this was practically the limit, but there was some uncertainty as to the construction of a section of the revised statutes under which it was claimed by some that upon "4 per cents," 90 per cent of the current market value could be issued, although no such issue was ever made to any bank.

The second proviso of section 8 requires banks in voluntary liquidation, when making a final deposit of lawful money to retire their circulation, to be assessed for the cost of redeeming their notes by the Treasurer of the United States. These banks had heretofore escaped paying any cost of redemption of their notes, as had also the bank retiring circulation under the act of June 20, 1874. The cost of redemption in all these cases had been assessed upon the active banks. But now both banks in voluntary liquidation and banks retiring a portion of their circulation are required to bear their share of the general cost of redemption of national-bank notes at the Treasury Department.

Section 9 regulates the deposit of lawful money by national banks for the purpose of retiring their circulation. Previously, circulation might be retired and bonds withdrawn down to the minimum limit, by the deposit of lawful money. This was a great convenience to the banks, by enabling them to take out bonds bearing a high rate of premium, and afterward putting in other bonds, when the market was more favorable for their purchase. It was feared that the banks might, in the free exercise of this right, bring about a severe contraction of the currency; it was, therefore, provided that, except for the withdrawal of called bonds, not more than \$3,000,000 shall be deposited in any calendar month; that no bank retiring circulation by deposit of lawful money can receive new circulation again for a period of six months from the time of making such deposit. If more than \$3,000,000 in lawful money are offered in any calendar month, the deposits are received and acted upon in their order, and the surplus in one month becomes entitled to precedence in the next month.

Section 10 does away with the limit previously imposed, that no bank organized after July 12, 1870, should receive over \$500,000 in circulating notes. It also removes the ambiguity previously existing in the law relative to United States bonds bearing less than 5 per cent interest, and provides that any United States bonds bearing interest may be received from national banks as a basis for the issue of circulating notes. It also provides that the amount issued to any bank shall not exceed 90 per cent of its capital stock, and that the amount issued upon bonds shall not exceed 90 per cent of their current market value if less than par, and in no case shall exceed 90 per cent of their par value.

Under the provisions of the act above re-

ferred to, 187 new national banks were organized during the calendar year ended December 31, 1882, and were authorized to commence business with a capital of \$16,642,300.

Section 12 of the Bank Charter Act, approved July 12, 1882, reads as follows:

That the Secretary of the Treasury is authorized and directed to receive deposits of gold coin with the Treasurer or assistant treasurers of the United States, in sums not less than twenty dollars, and to issue certificates therefor in denominations of not less than twenty dollars each, corresponding with the denominations of United States notes. The coin deposited for or representing the certificates of deposit shall be retained in the Treasury for the payment of the same on demand. Said certificates shall be receivable for customs, taxes, and all public dues, and when so received may be reissued; and such certificates, as also silver certificates, when held by any national banking association, shall be counted as part of its lawful reserve; and no national banking association shall be a member of any clearing-house in which such certificates shall not be receivable in the settlement of clearing-house balances: *Provided*, That the Secretary of the Treasury shall suspend the issue of such gold certificates whenever the amount of gold coin and gold bullion in the Treasury reserved for the redemption of United States notes falls below \$100,000,000; and the provisions of section 5207 of the Revised Statutes shall be applicable to the certificates herein authorized and directed to be issued.

The effect of this proviso is to prevent the holders of legal-tender notes from too rapidly and freely presenting them for redemption in gold coin, in order to deposit the latter and secure gold certificates. The amount of gold certificates issued to December 30, 1882, was \$64,619,840, of which sum \$25,105,030 was held by the Treasurer of the United States.

The excess of exports over imports of gold during the calendar year 1882 was \$25,318,551.

The deposits of bullion and coin, exclusive of redeposits, were, of gold, \$41,921,263.76, and of silver, including purchases, \$85,161,254.49, making a total of \$77,082,518.25; of which \$18,900,132.57 of gold and \$2,172,237.43 of silver were again deposited, making the total amount received and operated upon during the year at all the mints and assay-offices \$60,821,396.33 of gold and \$37,333,491.92 of silver, a total of \$98,154,888.25.

The deposits of domestic production were, gold, \$31,378,248.82, and silver, \$31,400,792.95, a total of \$62,779,041.77; of foreign bullion and coin, gold, \$8,338,619.78, and of silver, \$2,788,039.84; of United States coin, gold, \$402,148.91, of silver, \$587,529.43, a total of \$996,678.34; and of jewelry, plate, etc., gold, \$1,795,246.25, silver, \$384,892.27.

COINAGE OF CALENDAR YEAR 1882.—The total number of pieces struck during the year, and their value, were as follow: Pieces, 88,805,831; of which 7,215,831 were gold; 31,507,000 silver, and 50,083,000, one, three, and five cent pieces; valued at \$94,820,120.

The following table, prepared by the Bureau of Statistics, presents in the order of magnitude the value of merchandise imported into the United States by articles, during the fiscal years 1881 and 1882:

## FISHERIES OF THE UNITED STATES

FOR THE YEAR 1880.

I. NEW ENGLAND STATES.—1. *Maine*. In the extent and value of her sea-fisheries, Maine ranks second only to Massachusetts:

Persons employed: sea, 11,071; river, 1,591.....	12,662
Vessels employed.....	606
Tonnage of same.....	17,638
Fishing-boats.....	5,920
Capital dependent on fishery industries: sea, \$3,375,994; river, \$73,808.....	\$3,454,302
Pounds of products as they come from the water: sea, 202,043,449; river, 4,780,244.....	206,778,638
Value of same, sea.....	\$1,790,849
Pounds of products, as prepared for market: sea, 116,122,043; river, 3,794,180.....	119,916,228
Enhancement of value by preparation.....	\$1,823,329
Value of river-products as sold.....	\$125,046
Value of sea-products (marketable).....	\$3,614,178
Total value of products.....	\$3,739,224

In addition to the 12,662 persons actually engaged in the fisheries, there is a large number employed in transporting products to larger markets, in building and repairing vessels, in making boxes, barrels, cans for packing fish, etc. Probably some 2,500 are thus employed, making a total of over 15,000. Estimating that the larger part of these have families, it is probable that about 48,000 (equal to  $7\frac{1}{2}$  per cent of the population of the State) derive their main support from the fishery industries. It should also be noted that the cost of the products to the consumer is largely increased in various ways (by transportation charges, etc.), so that, adding some \$3,000,000 to the sum named above, this cost is equal to nearly \$6,750,000.

2. *New Hampshire*:

Persons employed: in vessels and boats, 376; others, 38.....	414
Capital invested (vessels, boats, nets, wharves, etc.).....	\$209,465
Value of products (10,400,294 pounds fish).....	\$175,684

3. *Massachusetts*:

Persons employed in vessels and boats, as curers and packers, etc.....	20,117
Number of fishermen: vessel, 12,367; boat, 4,323. Vessels employed.....	17,165
Boats employed.....	1,007
Tonnage of boats and vessels.....	6,749
Capital invested (vessels, boats, nets, buildings, etc.).....	\$14,394,450
Pounds of fish as caught.....	841,985,982
Pounds of lobsters, clams, oysters, etc.....	1,275,000
Pounds as prepared for market.....	221,666,174
Value in fresh condition.....	\$3,494,910
Enhanced by curing.....	\$1,557,646
Total value of fish as sold.....	\$5,052,900
Total value of lobsters, clams, oysters, etc.....	\$997,513
Total value of whale-fishery.....	\$2,059,337
Total value of products placed on market.....	\$3,141,750
Add 25 per cent as expenses, and profits of deal- ers, making wholesale value.....	\$10,117,187
Pounds of ice used for fish preservation.....	75,000,000
Pounds of salt used for curing.....	70,000,000

At least 5,000 additional persons are employed in building vessels, making nets, boxes, etc. Including families of fishermen and others dependent on fisheries, it is estimated that 100,000 people rely upon this industry for support. There are eleven customs districts in Massachusetts. Of these, Gloucester ranks first, producing, in fact, more than half the entire yield of the State; New Bedford, Barnstable, and Boston, rank next.

4. *Rhode Island*:

Persons employed: vessels, 536; boats, 1,066; curers, packers, etc., 708.....	2,301
Capital invested (vessels, boats, nets, etc.).....	\$296,678
Value of products (\$8,049,973 pounds fish).....	\$580,915

5. *Connecticut*:

Persons employed: vessels, 1,544; boats, 1,041; curers, packers, etc., 546.....	8,191
Capital invested (vessels, boats, nets, etc.).....	\$1,421,020
Value of products (\$8,509,367 pounds fish, includ- ing whale-oil, whalebone, menhaden-oil, etc.)..	\$1,456,866

II. MIDDLE STATES.—1. *New York*: The fisheries of New York and the other Middle States are arranged under three heads, as follows:

(a.) <i>Sea-Fisheries</i> :	
Persons employed: fishermen, 3,056; shoresmen, 522; factory-hands, 851.....	8,929
Vessels, 213; boats, 1,725; total.....	1,938
Capital invested (vessels, boats, traps, nets, facto- ries, etc.).....	\$1,706,840
Pounds of sea-products taken (including lobsters, crabs, clams).....	318,482,478
Value to fishermen.....	\$2,483,695
(b.) <i>River and Lake Fisheries</i> :	
Persons employed.....	1,688
Vessels, 12; boats, 502.....	514
Capital invested (vessels, boats, nets, etc.).....	\$157,285
Pounds of products (shad, sturgeon, lake-fish, etc.)	7,737,600
Value.....	\$919,820
(c.) <i>Oyster-Fisheries</i> :	
Persons employed: fishermen, 1,958; shoresmen, 766.....	2,724
Vessels, 426; boats, 1,714.....	2,140
Capital invested (vessels, boats, shore property)	\$1,013,060
Bushels of oysters.....	1,043,300
Enhanced value by preparation for market.....	\$583,750
Total value as sold.....	\$1,577,050

2. *New Jersey*:

(a.) <i>Sea-Fisheries</i> :	
Persons employed: fishermen, 4,254; shoresmen, 85; factory-hands, 742.....	4,481
Vessels, 89; boats, 3,265—total.....	3,304
Capital invested (vessels, boats, traps, nets, etc.)	\$456,684
Pounds of sea-products (including lobsters, crabs, clams).....	48,574,456
Value to fishermen.....	\$1,004,529
(b.) <i>River and Lake Fisheries</i> :	
Persons employed.....	342
Vessels, 6; boats, 100.....	106
Capital invested (vessels, boats, nets, etc.).....	\$80,168
Pounds of products (alewives, shad, mixed river- fish, etc.).....	2,762,000
Value.....	\$91,435
(c.) <i>Oyster-Fisheries</i> :	
Persons employed: fishermen, 2,605; shoresmen, 372.....	2,917
Vessels, 375; boats, 1,400—total.....	1,975
Capital invested (vessels, boats, nets, etc.).....	\$1,037,000
Bushels of oysters.....	1,975,000
Enhanced value by preparation for market.....	\$110,625
Total value as sold.....	\$2,080,625

3. *Pennsylvania*:

(a.) <i>Sea-Fisheries</i> :	
Persons employed.....	101
Vessels and boats.....	16
Capital invested.....	\$23,440
Pounds of sea-products sold fresh.....	600,000
Value.....	\$36,000
(b.) <i>River and Lake Fisheries</i> :	
Persons employed: fishermen, 414; shoresmen, 37. Vessels, 3; boats, 148.....	451
Capital invested.....	151
Pounds products (shad, lake-fish, etc.).....	\$96,370
Value.....	2,393,000
(c.) <i>Oysters</i> :	
Bushels rehandled.....	\$96,550
Value as enhanced.....	250,000
	\$187,500

4. *Delaware*:

(a.) <i>Sea-Fisheries</i> :	
Persons employed: fishermen, 912; shoresmen, 24.....	936
Boats.....	539
Capital invested.....	\$39,906

Pounds of sea-products (including lobsters, crabs, etc.)	5,522,953
Value	\$162,354
(b.) River and Lake Fisheries:	
Persons employed: fishermen, 450; shoresmen, 63	513
Vessels, 3; boats, 150—total	153
Capital invested	\$100,825
Pounds of products (including alewives, shad, sturgeon, etc.)	4,295,250
Value	\$147,116
(c.) Oyster-Fisheries:	
Persons employed: fishermen, 820; shoresmen, 30; factory-hands, 215	1,065
Vessels, 65; boats, 300—total	365
Capital invested	\$145,500
Bushels of oysters	300,000
Bushels of oysters rehandled	834,500
Enhanced value	\$187,500
Total value as sold	\$687,725

1. New York ranks fourth in the list of fish-producing States. Her menhaden-fisheries are more extensive than those of any other State. The value of her oyster-fisheries is greater than that of any other of the States, except Maryland, Virginia, and New Jersey. More soft-clams are here obtained than anywhere else; and in shad-fisheries she ranks third on the list.

2. New Jersey is sixth on the list. Her oyster-products are exceeded only by Maryland and Virginia. Crab-fisheries are more extensive in New Jersey than in any other State. In menhaden-fisheries she stands fifth, but her river-fisheries are unimportant.

3. Pennsylvania is chiefly interested in the oyster industry. Sea-fishing is confined to sea-bass, shad, sturgeon, etc., taken in small quantities.

4. Delaware. The oyster industry is the principal fishery business of this State, over two thirds of the money realized by fishermen being derived from the capture and sale of this species. Other fishery interests of the State are limited. There is some net-fishing for shad, sturgeon, etc., in the Delaware and its tributaries.

5. Further, from the statistics of the more important species taken by fishermen of the Middle States, it appears that 318,588,700 pounds, or over three fourths of the entire catch, are menhaden. The next species in importance for bulk is the oyster, and, allowing seven pounds of meat for each bushel of shell-oysters, there results 23,238,100 pounds of oyster-meats. Of other species are taken (in quantities exceeding 5,000,000 pounds), squeteague, 11,063,500 pounds; blue-fish, 6,710,800 pounds; hard-clams (allowing eight pounds of meat to the bushel), 5,933,664 pounds; codfish, 5,247,000 pounds; shad, 5,207,200 pounds. Fourteen other species are produced in quantities ranging from 1,000,000 to 5,000,000 pounds each.

#### GENERAL SUMMARY OF FISHING INTERESTS OF THE MIDDLE STATES.

Persons employed	16,017
Fishing-vessels	1,211
Tonnage of vessels	23,576
Fishing-boats	8,501
Capital dependent on fishery industries	\$4,599,828
Pounds of fish sold fresh for food	55,277,776
Pounds of fish salted for food	2,494,000

Pounds of other products for food	86,758,836
Pounds of miscellaneous products for fertilizers and other purposes	819,005,700
Value of products in marketable condition	\$8,874,899

It is estimated that not less than 62,000 persons in the Middle States are largely dependent on the fisheries for a livelihood. Thousands of others have more or less interest in this industry. The \$8,874,899 represent the actual value to the fishermen, deducting all expenses. There is, of course, a considerable increase from the producer to the consumer, which may be roughly estimated at \$6,000,000. Hence the products of the fisheries of the Middle States, as they finally enter into consumption, are worth nearly \$15,000,000.

#### III. SOUTHERN ATLANTIC STATES.—1. Maryland:

(a.) Sea-Fisheries:	
Persons employed: fishermen, 275; shoresmen, 15; factory-hands, 15	305
Vessels, 6; boats, 200—total	206
Capital invested (vessels, boats, nets, factories, etc.)	\$43,825
Pounds of products (including terrapin, crabs, etc.)	6,081,667
Value to fishermen	\$88,451

(b.) River-Fisheries:	
Persons employed: fishermen, 2,735; shoresmen, 451	3,186
Vessels, 12; boats, 928	940
Capital invested (vessels, boats, nets, shore-property, etc.)	\$294,518
Pounds of products (alewives, shad, mixed fish, etc.)	15,480,908
Value to fishermen	\$402,783

(c.) Oyster Industry:	
Persons employed: fishermen, 13,748; shoresmen, 790; factory-hands, 8564	23,402
Vessels, 1,450; boats, 1,825—total	3,275
Capital invested (vessels, boats, shore-property, etc.)	\$6,084,850
Bushels of oysters	10,600,000
Bushels of oysters rehandled	7,638,492
Enhanced value by preparation for market	\$2,080,476
Total value as sold	\$4,730,476

#### 2. Virginia:

(a.) Sea-Fisheries:	
Persons employed: fishermen, 1,830; shoresmen, 20; factory-hands, 607	2,457
Vessels, 119; boats, 1,439—total	1,558
Capital invested (vessels, boats, factories, etc.)	\$407,435
Pounds of products (including terrapin, crabs, etc.)	98,261,805
Value to fishermen	\$683,240

(b.) River-Fisheries:	
Persons employed: fishermen, 2,534; shoresmen, 107	2,641
Vessels, 20; boats, 1,258—total	1,278
Capital invested (vessels, boats, nets, shore-property, etc.)	\$264,762
Pounds of products (alewives, shad, mixed fish, etc.)	12,752,064
Value to fishermen	\$272,823

(c.) Oyster Industry:	
Persons employed: fishermen, 14,236; shoresmen, 501; factory-hands, 1,578	16,315
Vessels, 1,317; boats, 4,481—total	5,798
Capital invested (vessels, boats, shore-property, etc.)	\$1,831,100
Bushels of oysters	6,837,320
Bushels of oysters rehandled	1,622,130
Enhanced value by preparation for market	\$200,740
Total value as sold	\$2,218,976

#### 3. North Carolina:

(a.) Sea-Fisheries:	
Persons employed: fishermen, 1,707; shoresmen, 118; factory-hands, 25	1,850
Vessels, 4; boats, 1,110—total	1,114
Capital invested (vessels, boats, nets, factories, etc.)	\$172,800
Pounds of products (including terrapin, turtle, crabs, etc.)	10,167,300
Value to fishermen	\$220,745

*(b.) River-Fisheries:*

Persons employed: fishermen, 2,822; shoresmen, 832.....	8,204
Vessels, 13; boats, 1,204—total.....	1,217
Capital invested (vessels, nets, shore-property, etc.).....	\$299,061
Pounds of products (alewives, shad, mixed fish, etc.).....	29,892,188
Value to fishermen.....	\$564,950

*(c.) Oyster Industry:*

Persons employed: fishermen, 1,000; shoresmen, 20.....	1,020
Vessels, 90; boats, 800.....	890
Capital invested (vessels, boats, shore-property, etc.).....	\$63,500
Busbels of oysters.....	170,000
Value as sold.....	\$60,000

*4. South Carolina:**(a.) Sea-Fisheries:*

Persons employed: fishermen, 629; shoresmen, 24.....	653
Vessels, 10; boats, 237—total.....	247
Capital invested (vessels, boats, nets, factories, etc.).....	\$42,175
Pounds of products (including terrapin, crabs, etc.).....	4,749,400
Value to fishermen.....	\$153,125

*(b.) River-Fisheries:*

Persons employed: fishermen, 287; shoresmen, 12.....	299
Vessels, 2; boats, 217—total.....	219
Capital invested (boats, nets, etc.).....	\$14,490
Pounds of products (alewives, shad, etc.).....	1,043,850
Value to fishermen.....	\$89,857

*(c.) Oyster Industry:*

Persons employed: fishermen, 175; shoresmen, 10.....	185
Vessels, 10; boats, 100—total.....	110
Capital invested (boats, gear, etc.).....	\$12,250
Busbels of oysters.....	50,000
Value as sold.....	\$20,000

*5. Georgia:**(a.) Sea-Fisheries:*

Persons employed: fishermen, 121; shoresmen, 40.....	161
Boats.....	66
Capital invested (boats, nets, factories, etc.).....	\$43,625
Pounds of products (including terrapin, crabs, etc.).....	492,005
Value to fishermen.....	\$19,220

*(b.) River-Fisheries:*

Persons employed: fishermen, 488; shoresmen, 24.....	511
Vessels, 1; boats, 225.....	226
Capital invested (boats, nets, etc.).....	\$22,545
Pounds of products (including shad, mixed fish, etc.).....	1,290,500
Value to fishermen.....	\$65,768

*(c.) Oyster Industry:*

Persons employed: fishermen, 800; shoresmen, 50.....	850
Boats.....	100
Capital invested (boats, gear, etc.).....	\$18,500
Busbels of oysters.....	70,000
Value as sold.....	\$35,000

*6. East Florida:**(a.) Sea-Fisheries:*

Persons employed: fishermen, 223; shoresmen, 15.....	238
Boats.....	245
Capital invested (boats, nets, etc.).....	\$27,794
Pounds of products (including terrapin, turtle, shrimps, etc.).....	1,479,300
Value to fishermen.....	\$41,072

*(b.) River-Fisheries:*

Persons employed: fishermen, 170; shoresmen, 12.....	182
Boats.....	83
Capital invested (boats, nets, etc.).....	\$15,950
Pounds of products (including shad, mixed fish, etc.).....	667,450
Value to fishermen.....	\$82,336

*(c.) Oyster Industry:*

Persons employed: fishermen, 50; shoresmen, 6.....	56
Boats.....	60
Capital invested (boats, gear, etc.).....	\$6,100
Busbels of oysters.....	20,000
Value as sold.....	\$5,000

1. Maryland's place in sea-fishery is unimportant, but in oyster and river fisheries she ranks next to Massachusetts in the value of products, and first on the list in the number of persons employed. The oyster interests are more important than in any other State. More shad, too, are taken than in any other State, and she ranks second only to North Carolina in the extent and value of her alewife (called herring) fisheries.

2. Virginia ranks seventh on the list of fish-producing States. In the oyster-fishery she ranks second to Maryland. Her menhaden-fishery is much increased; and her river-fisheries are important, yielding shad and alewives in large abundance.

3. North Carolina ranks first in alewife-(called herring-) fishery, the catch being 15,520,000 pounds, worth \$142,784. The shad taken nearly equal those of Maryland, but bring higher price, owing to their early appearance in Northern markets. In the mullet-fishery North Carolina is second only to Florida, the catch amounting to 3,368,000 pounds, worth \$80,500.

4. South Carolina is twentieth in the list of fish-producing States. Her shrimp-fisheries are more important than those of any other State. In 1880 her fishermen secured 18,000 bushels, valued at \$37,500. Alewives, shad, and sturgeon are the chief fishes caught.

5. Georgia's sea-fisheries are as yet undeveloped, and rank lowest on the list. Her river-fisheries are better, shad and sturgeon being the principal fish caught.

6. Eastern Florida, on the Atlantic coast—fishing chiefly by hook-and-line and cast-nets. Green-turtle were taken on Indian River amounting to 88,250 pounds, valued at \$6,000. Shad-fisheries are recent but extensive. The yield for 1880 was 251,700 pounds, valued at \$20,136.

7. Further, it appears that two fifths of the product of fishery in the South Atlantic States are oyster-meats. Menhaden are the largest catch, being over 92,000,000 pounds. Next are alewives (called herring), about 32,000,000 pounds, and shad, nearly 11,000,000 pounds. Mullet, crabs, blue-fish, perch, and striped-bass are taken in quantities exceeding 2,000,000 pounds; and nine other species range between 1,000,000 and 2,000,000 pounds.

## GENERAL SUMMARY OF FISHING INTERESTS OF THE SOUTHERN ATLANTIC STATES.

Persons employed.....	52,418
Fishing-vessels.....	3,014
Tonnage of same.....	60,886
Fishing-boats.....	13,381
Capital dependent on fishery industries.....	\$8,951,722
Pounds of fish sold fresh for food.....	42,571,340
Pounds of fish salted for food.....	20,579,500
Pounds of products, other than fish, for food.....	129,719,527
Pounds of miscellaneous products for fertilizers and other purposes.....	94,663,800
Value of products to the fishermen.....	\$9,602,737

It is estimated that some 30,000 families are represented in the fishing interests in this district, and that the total number of people de-

pendent on the fisheries scarcely falls below 200,000. Fully five eighths of these are Americans. Excepting a few foreigners, chiefly of Spanish descent, the remainder are mostly negroes. The \$9,602,737 represent the sum realized by the fishermen as the result of their labor, and not the market value of the catch. Owing to the cost of transportation, icing, packing, etc., the values of many of the products are greatly increased before they finally reach the consumer. Hence the market value of the products is not less than \$16,600,000.

**FLORIDA. STATE GOVERNMENT.**—The State officers during the year were as follow: Governor, W. D. Bloxham (Democrat); Lieutenant-Governor, L. W. Bethel; Secretary of State, John L. Crawford; Treasurer, Henry A. L'Engle; Comptroller, W. D. Barnes; Attorney-General, George P. Raney; Superintendent of Public Instruction, E. K. Foster; Adjutant-General, J. E. Yonge; Commissioner of Lands and Immigration, Hugh A. Corley. Judiciary: Chief-Justice of Supreme Court, Edwin M. Randall; Associate-Justices, James D. Westcott, Jr., and R. B. Van Valkenburgh.

**INTERNAL IMPROVEMENTS.**—The reclamation of lands in the southern portion of the peninsula, by affording an outlet for the waters of Lake Okeechobee, has been much discussed for many years, but no decisive step was taken in that direction until January, 1881. At that date Colonel I. Coryell appeared before the Board of Trustees of the Internal Improvement Fund, as the representative of Philadelphia capitalists, and negotiated a contract with the board for the drainage and reclamation of the lands lying south of township twenty-four, in consideration of receiving one half of the lands so reclaimed. The last Legislature chartered the "Atlantic and Gulf Coast Canal and Okeechobee Land Company," who have succeeded to all the rights under the contract.

This company immediately had a series of surveys made to test the practicability of the proposed undertaking, and from their surveys, as well as those made by the United States, under the direction of General Gillmore, it was shown that Lake Okeechobee has an elevation of twenty-two feet above the Gulf of Mexico, and that Lake Tahoepekalgia, the head-waters of the Kissimmee River, has an elevation of sixty-five feet above the waters of the Gulf. These facts being ascertained, the company assumed the entire practicability of reclaiming this vast area, amounting to many million acres, by drawing off the waters, and preventing the periodical overflows. The work was commenced by building powerful steam-dredges on the Caloosahatchee River and Tahoepekalgia Lake, the plan of operations being to open a canal from the Caloosahatchee River to Lake Okeechobee, and the cutting of a canal from Lake Tahoepekalgia through to Kissimmee Lake, then straightening the Kissimmee River, and the cutting of one or more canals from Okeechobee to the Atlantic Coast, as well as the construc-

tion of subsidiary canals. The dredge upon the Caloosahatchee entered Lake Okeechobee on the 21st of December.

Up to December 1, 1882, the company report that they had expended \$93,777.40, and had constructed over twelve miles of canal, twenty-two to thirty-five feet wide and five to six feet deep.

The early completion of the first series of canals is already assured, which, in addition to the reclamation of the lands, will afford a great inland system of steamboat navigation from Kissimmee City through the Caloosahatchee to the Gulf of Mexico, a distance of 180 miles.

The feasibility of forming an inland water communication from the mouth of the St. John's River to Biscayne Bay, in the extreme southern portion of the State, a distance of some two hundred and seventy miles, by utilizing the waters of Pablo Creek and North, Matanzas, Halifax, and Indian Rivers, has long been conceded. It took practical shape when Colonel I. Coryell and Hon. John Westcott organized, under the general incorporation act, the "Florida Coast-Line Canal and Transportation Company," with a capital of \$500,000. Active operations were commenced in November, by the construction of a suitable steam-dredge, which was carried from St. Augustine to the south end of Matanzas River, where it commenced operations.

In regard to railroads, the Governor, in his message to the Legislature of 1883, says:

Florida has every cause of congratulation in having more miles of railroad construction in her limits, in the last two years, than in her entire former history. West Florida, that has for so many years been cut off from direct communication with the remaining portion of the State, has now practically rail connection with our system of roads; and Pensacola, the queen of all Gulf ports, as well as the interior western counties, will in a few weeks have direct communication with our Atlantic sea-ports. The rapidity with which the Pensacola and Atlantic road has been built, connected with its superior structure and equipments, speaks well for the company, as well as for the efficient superintendent. The time is not far distant when through trains of freight and passenger travel from the Golden Gate of the Pacific will find their exit by this line through the ports of Jacksonville and Fernandina. The Florida Southern has also completed, and has in operation, one hundred miles of road, and I am informed has made arrangements for a further and greatly increased extension. The road chartered from Live Oak to Rowland's Bluff has been finished to the latter point, and is vigorously pushing forward in the direction of South Florida. The roads from Wacarcross to Jacksonville, and from Fernandina to Jacksonville, have been completed. Jacksonville and St. Augustine will, in a short time, have a new road completed, and thus be furnished with direct rail connection. The road from Waldo has been pushed on to Silver Spring and Ocala, connecting there with the Tropical, which has been built and is in operation as far south as Wildwood, in Sumter County, with a branch graded and cross-tied from Wildwood to Leesburg. The South Florida road has been built from Orlando to Kissimmee City, thus giving the Kissimmee Valley direct communication with the St. John's, The St. John's and Halifax, Palatka and Indian River, Green Cove and Melrose, and the Jacksonville, Tampa, and Key West roads, all have portions graded, and the former some eight miles of iron laid. While

these improvements are unparalleled in the history of the State, yet it is a source of deep regret that neither of the several lines leading to Tampa and farther south have yet reached that desirable section. The Trustees of the Internal Improvement Fund, appreciating the great advantages of that highly favored section, and with an earnest desire to secure to it railroad facilities, reserved lands for five different lines running to Tampa and some farther south, through the counties of Hernando, Polk, Hillsborough, and Manatee. From information received, however, I can but believe that the time is near at hand when these facilities, so long needed, will be secured.

**STATISTICS.**—The total receipts into the State Treasury on account of general revenue (including interest taxes) for the fiscal year ending December 31, 1882, amounted to \$350,569.80, as follows:

State-tax proper, 1882.....	\$14,215 43
“ “ 1881.....	124,045 11
“ “ 1880.....	6,738 79
“ “ 1879.....	201 02
“ “ 1878.....	120 75
“ “ 1877.....	143 74
“ “ 1876.....	24 52
“ “ 1875.....	459 40
“ “ 1874.....	1,446 94
License-tax.....	104,735 62
Auction-tax.....	641 73

<b>Total.....</b>	<b>\$23,669 81</b>
General and special sinking fund and interest-tax, 1882.....	6,182 29
<b>Grand total.....</b>	<b>\$350,569 80</b>

The following statement shows the amount of warrants and coupons paid at the Treasury for the fiscal year ending December 31, 1882:

Salaries, Executive Department.....	\$18,787 00
“ “ Judicial Department.....	83,020 00
Contingent expenses of State.....	2,800 76
Stationery, Executive and Legislative Departments.....	620 88
Expenses of collection of revenue.....	22,566 14
Expenses of Bureau of Immigration.....	7,367 40
Post-mortem examinations.....	250 00
Printing.....	6,198 87
Maintenance of lunatics.....	27,177 92
Jurors and witnesses.....	45,327 98
Contingent expenses of Supreme Court.....	2,243 63
Insurance of Capitol.....	525 00
Watchman at Capitol.....	257 00
Janitor at Capitol.....	275 00
Conveying prisoners to Penitentiary.....	10 50
Railroad-tax litigation.....	137 12
Repairs of Capitol.....	1,191 91
Criminal prosecutions.....	89 21
Expenses of printing Digest.....	2,932 50
Legislative relief acts.....	456 14
Interest on coupon bonds of 1871 and 1873.....	118,128 72
<b>Total.....</b>	<b>\$289,693 68</b>

The estimated appropriations necessary for the fiscal year 1883 are \$315,573, including \$69,000 for expenses of legislative session and \$80,000 for interest on bonds; for 1884, \$243,573. The following is a statement of the bonded debt:

7 per cent bonds of 1871.....	\$350,000 00
6 per cent bonds of 1873.....	925,000 00
8 per cent Convention bonds.....	1,500 00
<b>Total.....</b>	<b>\$1,275,500 00</b>

Of this indebtedness there is:

In sinking funds.....	\$159,500 00
In school fund.....	285,600 00
In Seminary fund.....	87,400 00
In Agricultural-College fund.....	134,200 00
<b>Total.....</b>	<b>\$666,700 00</b>

Leaving in the hands of individuals..... \$609,800 00

In relation to other bonds, the Comptroller makes the following statement:

In addition to the above bonds there appears to be outstanding \$4,000 of bonds issued in 1875, which have never been presented at the Treasury for payment of either principal or interest.

There are also 7 per cent bonds of the State held by the Indian Trust Fund of the United States amounting to \$132,000, but as an offset the State has a claim against the United States for an amount more than sufficient to cover the face of these bonds with interest.

Upon coming into office, I receipted to my predecessor, the Hon. Columbus Drew, for \$75,000 of the 6 per cent bonds authorized to be issued under the act of February 21, 1873, which had not been sold or exchanged, as provided by said act. They numbered from 2,951 to 3,700. These were destroyed on the 17th of February, 1881, by a committee of the Legislature appointed for that purpose.

The table of assessment for 1882 shows that the taxable valuations amounted to \$45,285,977, a large increase since 1880. But more than \$3,000,000 of this was upon railroad property for which exemption is claimed. “It is deemed safe, however,” says the Comptroller, “to base estimates for a revenue upon \$42,000,000 of tax-paying property, and if the income from licenses is not diminished, a rate of four mills on the dollar is thought to be sufficient to raise the revenue required to defray the current expenses of the State government and meet the accruing interest on the bonded debt. This estimate is not intended to include the constitutional tax of one mill for school purposes.”

The question of the liability of the particular railroads claiming immunity from taxation, has been submitted to the courts of the State by suits brought in compliance with a resolution adopted at the last session of the Legislature, with results favorable to the State, but the cases are now pending in the Supreme Court of the United States on appeal.

The State taxes in 1882 were as follow: State tax, \$200,827.28; sinking funds, \$91,531.95; school fund, \$45,332.71—total, \$337,691.94. The county taxes were: County tax proper, \$175,369.82; county school tax, \$135,235.42; county special tax, \$115,963.84—total, \$426,569.08.

The last Legislature (says the Governor in his message) passed an act to provide for the assessment and collection of taxes upon improvements on the public lands, and for the protection of occupying claimants of said lands. The object and intention of the law was to protect actual settlers, and furnish them some guarantee of securing the land upon which they had made improvements. The operation of the law, however, has not been satisfactory, and in some instances has led to results foreign to those for which it was intended. Parties have been compelled to pay taxes upon their improvements on United States lands, and on lands previously granted by the Legislature to railroads, without any prospect of being protected by the State. Other cases of hardship have occurred, and, unless the law can be materially amended, I recommend its repeal.

There has been a large increase in school facilities and in the attendance of pupils. The number of schools in 1877 was 656, with 29,678 pupils; in 1880, 1,131, with 39,315 pupils; for the scholastic year beginning October 1, 1882, 1,326, with 51,945 pupils. The principal of the common-school fund has also increased, rising from \$246,900 in January, 1881, to \$323,535.42 at the close of 1882. It was recently ascertained that nearly 80,000 acres of school lands were due from the United States. Selections amounting to 43,745.<sup>92</sup>/<sub>100</sub> acres have been approved, and the residue, it is expected, will be speedily located. There are 561,728 acres of land belonging to the school fund and 33,820 acres belonging to the seminary fund yet unsold.

The Governor in his message calls the attention of the Legislature to the subject of deaf-mute education in the following language:

I can not forbear in this connection calling your attention to the entire absence of any legislation for the education of that unfortunate class of our population known as deaf-mutes. There are in the State, as shown by the last census, 119; of these 58 are white and 61 colored. There are under the age of twenty-five, and now urgently requiring educational facilities, 78. Of this number 32 are white and 46 colored. I can imagine no class of our citizens who are so entirely dependent upon education, and I sincerely trust that the subject may receive your careful and favorable consideration. Some portion of the common-school fund should be set apart, under the direction of the State Board of Education, for this praiseworthy object.

Under the Agricultural College grant Florida received ninety thousand acres, which were sold for \$81,000. The proceeds of the sale were invested in \$100,000 of Florida bonds. The interest has since been invested, and the fund now has an income of about \$9,000 per annum. As no portion of the fund nor the interest can be applied to building purposes, no institution has been established. The trustees of this fund were to meet in Tallahassee on the 9th of January, 1883, to take into consideration the best means of utilizing the income for educational purposes.

On January 1, 1881, there were 95 inmates in the insane asylum. During the two following years there were admitted 112; discharged, 50; died, 26; escaped, 8; readmitted, 5; in the institution January 1, 1883, 128, of whom

86 were white males, 44 white females, 27 colored males, and 21 colored females.

The East Florida Railway Company had the State convicts in charge during 1881 and 1882. It received the convicts at the several jails, paid all expenses after conviction, and, in addition, paid into the State Treasury over \$6,000 for their services during the two years. The convicts have been let for the years 1883 and 1884 to an individual for the sum of \$9,200, the other conditions being the same as those in the railway lease. The number of convicts December 31, 1880, was 129, which were handed over to the railway company; delivered to it during 1881, 101; discharged, 49; pardoned, 4; escaped, 13; died, 14; sentence commuted, 1; remaining, January 1, 1882, 149; delivered to the railway company during the year, 69; discharged, 55; pardoned, 3; escaped, 5; died, 10; remaining at the close of the year, 135.

Of the population in 1880 (269,493), 186,444 were males, 133,049 females, 259,584 of native and 9,909 of foreign birth; 142,605 white, 126,690 colored, 18 Chinese, and 180 Indians. There were 61,699 males twenty-one years old and over, of whom 34,210 were white (30,351 native and 3,859 foreign) and 27,489 colored. Of persons ten years of age and upward, 70,219, or 88 per cent, were unable to read, and 80,183, or 43.4 per cent, were unable to write, including 19,024 native whites, or 20.7 per cent of that class, and 60,420 colored persons, or 70.7 per cent of that class. Of the native population, 173,481 were born in the State, 32,601 in Georgia, 18,522 in South Carolina, 12,023 in Alabama, 6,297 in North Carolina, 3,329 in Virginia, 2,375 in New York, 862 in Massachusetts, 855 in Pennsylvania, and 833 in Tennessee. There were living in the United States 194,518 natives of Florida. There were produced 54,997 bales of cotton, 3,174,234 bushels of corn, and 468,112 of oats; live-stock on farms, 22,636 horses, 9,606 mules and asses, 16,141 working-oxen, 42,174 milch-cows, 409,055 other cattle, 56,681 sheep, and 287,051 swine. There were 426 manufacturing establishments; capital, \$3,210,680; hands employed, 5,504; value of materials used, \$3,040,119; of products, \$5,546,448. The principal stock-raising counties, with the number of cattle in each, according to the tax-books of 1881, are as follow: Manatee, 53,273; Brevard, 39,632; Monroe, 24,710; Polk, 22,082; Hillsborough, 21,223; Sumter (1880), 16,276; Hernando, 14,882; Volusia, 13,635; total for eight counties, 205,714.

In the case of Emily R. Wilson, executrix, etc., vs. Phæbe Fridenburg, the Supreme Court decided the following points relating to the homestead exemption in this State:

1. Under the Constitution of this State the right of a wife as to the homestead is confined to a power to prevent alienation by her husband, the head of the family, without her consent made jointly with him. But the Constitution does not, however, repeal the statute allowing dower in the estate of the husband, and this right exists as to the homestead.

2. The exemption is from the debts of the head of the family, the owner of the homestead. It accrues to the heirs of the party having taken or enjoyed the benefit of it. Where such owner dies, leaving surviving him a widow and children, the right of the widow, if the estate is an intestate estate, is restricted to dower, and the benefit of the exemption as to the remainder of the estate in the homestead, after allowing dower, enures to the benefit of the children.

3. If the estate is a testate estate and the devise to the widow is inconsistent with dower, then the widow is put to her election between the will and dower, and, if she does not elect dower within one year after the probate of the will, she is confined to the will, in which event the benefit of exemption as to the entire homestead enures to the children, as the homestead is not the subject of a testamentary disposition by the head of the family.

4. Where, in case of the wife surviving the husband, he dying testate, leaving her executrix with power of sale under the will, she executes a mortgage of the homestead under an order of court, the children surviving, not being parties to such proceeding, are not bound by it.

5. To all proceedings affecting the homestead upon the death of the head of the family, his heirs are necessary parties.

**CONSTITUTIONAL CONVENTION.**—The question of calling a Constitutional Convention is a prominent one before the people of the State. It seems to be generally conceded that one should be called, but upon the manner of calling it there are differences, some contending for the immediate submission of the question to the people, while others argue for the more dilatory course marked out by the Constitution. On this subject the Governor says:

The last Legislature passed a resolution looking to the calling of a Constitutional Convention for an entire revision of the organic law of the State. That the Constitution needs revision in many important particulars is, I believe, conceded by all. Indeed, in all its departments, legislative, executive, and judicial, important changes are required in the interest of economy, and to more properly conform it to the requirements of the people and the true principles of republican government.

**ELECTION RETURNS.**—In November Congressmen, half of the Senate, and the entire Assembly, were elected. The new congressional districts consist of the following counties: 1. Calhoun, Escambia, Franklin, Gadsden, Hernando, Hillsborough, Holmes, Jackson, Jefferson, Lafayette, Leon, Levy, Liberty, Manatee, Monroe, Polk, Santa Rosa, Taylor, Wakulla, Walton, Washington; 2. Alachua, Baker, Bradford, Brevard, Clay, Columbia, Dade, Duval, Hamilton, Madison, Marion, Nassau, Orange, Putnam, St. Johns, Sumter, Suwanee, and Volusia.

In the First District, R. H. M. Davidson, Democrat, received 11,246 votes; Emory F. Skinner, Republican, 7,029; D. L. McKinnon, Independent, 3,547; Democratic plurality, 4,217; Democratic majority, 6,701. In the Second District, the vote was: for Horatio Bisbee, Jr., Republican, 13,069; Jesse J. Finley, Democrat, 12,813; Republican majority, 256. The Legislature has 6 Republicans, 17 Democrats, and 9 Independents in the Senate, and 27 Republicans, 34 Democrats, and 15 Independents in the House.

**YELLOW FEVER.**—An epidemic of yellow fever existed in Pensacola during the autumn, but it did not assume serious proportions as on some former occasions. (See EPIDEMICS.)

**FOOD-PRESERVATION.** The problem of protecting meat from septic contamination, without alteration of the flavor and culinary qualities, is an important one with reference to the great waste of food in the ordinary ways of supplying communities. But its economical importance is so much greater, and the prospect of reward surer, since great nations have come to depend largely on supplies brought from across the seas, that chemical inventors have applied themselves in earnest to its solution. Refrigeration is a costly method of arresting putrescent decay, and one subject to accidents; but no better method of keeping dressed meat has been known, and vast quantities have been transported over the ocean in expensive cooling compartments. Carbolic acid and other substances used in antiseptic surgery can not be employed, as they would destroy meat for food. Boracic acid is the only chemical antiseptic which is tasteless and innocuous. It has come into use extensively for the preservation of milk, and as the basis of most of the antiseptic preparations sold. To give it the sufficient degree of solubility, bicarbonate of soda and other substances not entirely innocent are added.

It has been found that boracic acid is not an antiseptic by itself, but acquires that quality by combination with some elements in the substances to preserve which it is used. The character and conditions of the union are undetermined, and its action as a preservative is somewhat uncertain. Professor Barff has sought for a compound with original antiseptic properties, and has discovered it in boroglyceride, a compound of glycerine and anhydrous boric acid, with the formula  $C_3H_5BO_3$ . The water of the glycerine is expelled and replaced by the acid, forming a new compound which is chemically analogous to a fat, being a combination of the base glyceril, or  $C_3H_5$ , with an acid. It is a hard and brittle mass at ordinary temperatures, but acquires a semi-fluid consistency when heated, and is then freely soluble in warm water. It is employed in solutions of one part of boroglyceride to from twenty to sixty parts of water, according to the requirements to be met. The solutions are almost tasteless, and substances treated with them acquire no foreign flavor. Their antiseptic efficacy is remarkable. Meat, oysters, poultry, etc., after immersion in the liquid, will keep for months without any trace of decomposition. Milk and soup are preserved by admixture. The finer gustatory flavor of meat is not retained long in perfection, being probably dependent on volatile elements. A gallon of the solution, in which many pieces of meat can be successively immersed, costs fifteen or twenty cents.

The antiseptic which is considered the best is boracic acid, which alters neither the taste,

nor appearance, nor other quality of the meat. A method has been tested in England by which the antiseptic fluid is introduced into the living body of an animal, and distributed to all parts of the carcass by the natural action of the heart. The experiment was made with sheep by Hauting, a veterinarian. The animal was first stunned by a blow from a mallet. The jugular vein was opened and a pint of blood drawn out. A rubber tube was then inserted, through which a quart of the preservative liquid was absorbed. This was a saturated solution of boracic acid in water of the temperature of blood. The instrument, one well known in veterinary practice, was then closed, and, two minutes after the liquid was taken up into the circulation, the sheep was slaughtered in the usual way. The acid is very slightly soluble in water. The cost is only half a cent per mutton. The meat thus treated remains fresh without ice two or three weeks in summer, and as many months in winter.

To prepare this new antiseptic compound, glycerine is heated to a high temperature, and boracic acid is added as long as it will dissolve. The proportions are ninety-two parts of glycerine to sixty-two of boracic acid. The compound, if allowed to cool, takes a white, crystalline form. Water is evolved during the operation, and, when steam ceases to be given off, the mass sets in a hard, glacial substance, which shows a loss of fifty-four parts in weight, corresponding to three molecules of water. The hydroxyls in the glycerine unite with the three atoms of hydrogen in the hydrated boracic acid, the anhydrous boric acid ( $\text{BO}_3$ ) taking their place. Its action is like that of a fatty acid, and the resulting compound is formed like the natural fats.

M. Potel has invented a compound which he thinks will supplant sealed tin cans for the conservation of meats. It is a simple mixture of gelatine, glycerine, and tannin. It is semi-liquid when heated; and, when applied in that condition to the surface of the substance to be preserved, it forms an air-tight coating. It is applied at the temperature of  $50^\circ$  Centigrade, which is sufficient to destroy the germs of putrefaction, and hardens into an apparently durable hermetic envelope. He calls the mixture *poteline*, after his own name.

A depot for the storage of meat, fish, fruit, and vegetables has been established at Shore-ditch, in London, by the Great Eastern Storage and Refrigerating Company. There are dry-air refrigerating chambers, insulated with a new non-conducting material, which takes much less room than ordinary insulating substances. For the eight large chambers two refrigerators, capable of cooling 100,000 cubic feet of air per hour, are driven by two double-cylinder gas-engines, indicating nearly two hundred horsepower. This company acts as agent and consignee for shippers of dressed meat from America, Canada, and Australia, and expects to supply the London markets with a certain

quantity daily, so that cargoes arriving simultaneously will not cause losses to the shippers.

**FORESTS OF THE UNITED STATES.**  
**CONDITION OF AMERICAN PINE-FORESTS.**—A survey has been made, in connection with the compilation of the tenth census of the United States, of the forest resources of the whole country, with especial reference to the supply of pine-timber, the results of which have been published in a series of "Forestry Bulletins," showing for the several States the amount, by board-measurement, of timber yet standing, and graphically, by maps, the quantity of land still covered with timber available for use in each. To this is appended, in the tables, an estimate of the amount of timber cut in each State during the year of the census, and, in the maps, a representation of the area from which the timber has been removed.

The principal source of supply for white-pine lumber is still in the Northwestern Lake States, including Michigan, Wisconsin, and Minnesota. In these States there were standing, in the spring of 1880, 82,010,000,000 feet of merchantable pine, of which 41,000,000,000 were in Wisconsin, 35,000,000,000 in the two peninsulas of Michigan, and 6,100,000,000 in Minnesota. The amount of pine cut in these three States during the year was 7,035,507,000 feet. At this rate of destruction those States would be stripped of their pine-forests in less than twelve years. A rapid growth in consumption is, nevertheless, taking place; for, while according to the returns of the ninth census 3,912,199,000 feet of lumber, including hard-wood, were manufactured in these States, the amount had increased, in 1880, to 7,145,969,000, or by 83 per cent, and this notwithstanding 1870 was a year of greater relative prosperity and production than 1880. Some allowance is due, however, for the greater thoroughness with which the statistics for 1880 were collected, in consideration of which the ratio of increase might be reduced to 70 per cent. There still remain 1,800,000,000 feet of white pine and 4,500,000,000 feet of hemlock in Pennsylvania, and 475,000,000 feet of white pine and 5,000,000,000 of spruce in Maine, with scattering small tracts of white pine in Pennsylvania, and a considerable unestimated quantity of second-growth pine in Maine. The original white-pine forests of New Hampshire and Vermont are exhausted, but both those States have small quantities of second-growth pine available for use, and 2,265,000,000 feet of black spruce (*Picea nigra*.)

The four Atlantic southern pine-growing States contain, of long-leaved pine (*Pinus australis*): North Carolina, 5,229,000,000; South Carolina, 5,316,000,000; Georgia, 16,778,000,000; and Florida, 6,615,000,000; in all, 33,938,000,000 feet. In the same States, 713,700,000 feet were cut during the census year. Much of the timber still standing has been injured in the manufacture of turpentine.

The Gulf States and the Southwestern States are still competent to furnish immense supplies of their native pines suitable for timber, from which comparatively little has as yet been drawn. The estimates are: Alabama, long-leaved and short-leaved pines (*Pinus australis* and *Pinus mitis*), 21,192,000,000 feet; Mississippi, the same species, 23,975,000,000 feet; Louisiana, the same species, 48,213,000,000 feet; Arkansas, short-leaved pine (*Pinus mitis*), 41,315,000,000 feet; Texas, long-leaved pine (*Pinus australis*), short-leaved pine (*Pinus mitis*), and loblolly pine (*Pinus taeda*), 67,508,500,000 feet; in all, 202,203,500,000 feet. The long-leaved pine, which forms the mass of the timber of the Southern Atlantic coasts, and constitutes about two fifths of the timber of the five States last named, is considered more suitable for heavy constructions than the white pine of the North, but is harder to work, and inferior to white pine for the uses to which that wood is so extensively applied on account of its fullness of resin. The short-leaved pine of Arkansas, Louisiana, and Eastern Texas, is regarded as a valuable building material, but not as desirable as either the white or the long-leaved species. The Southern forests are destitute of undergrowth, and have been periodically burned over; and there is little probability of their place, when they have been once removed, being taken by a natural second growth.

Except in the case of the redwood-forests of California, no attempt has been made to estimate the amount, in feet, of the timber-supply of the Pacific States. The redwood (*Sequoia sempervirens*), the best substitute for white pine, forms a strip of forests of gigantic trees along the coast of California, from the northern boundary of the State to below the Bay of Monterey, which contained in 1880, 25,825,000,000,000 feet of timber. From these forests 186,635,000 feet had been cut during the year. The forests of California, outside of the redwood belt, and those of Oregon and Washington Territory, are indicated by maps representing their area, and coloring to show their relative density, but not enough is known of the country they cover to make any estimate of their capacity possible. They are very dense, and consist chiefly of coniferous trees of different species of very large growth, with chestnut-oaks (*Quercus densiflora*) in the northern coast-regions of California, and chestnut-oaks in the southern part, and the Pacific white oak (*Quercus Garryana*) in the river-valleys of Oregon. The most valuable and the prevailing tree is the red or yellow fir (*Pseudotsuga Douglasii*), which is the most important tree of the Coast Range forests of California, and forms seven eighths of the forests of Oregon and Washington Territory. It is a strong, resinous timber, hard to work, better suited for purposes of outside construction than for other uses, and is not regarded as equal to the long-leaved pine of the Southern States, while it is

far inferior for general purposes to white pine and redwood. Except the oaks which have been mentioned, the Pacific forests contain no hard-woods.

These reports of the Census Bureau give an accurate measurement of the waste of American forests, which had previously been only a subject of vague estimate. They show that the States which were once the "timber States" of the country—the Northern New England States, New York, and Pennsylvania—can not be included in that class any longer; and that the States whence the present supplies are drawn will soon cease to furnish them. The whole amount of white pine cut in the United States during the census year was about 11,000,000,000 feet; this, if continued, would exhaust the total supply of the country in eight or ten years. The capacity of the Canadian forests has not been as accurately measured as that of the forests of the United States, but it is estimated that they can not be depended upon for more than about five years' supply at the rate of consumption prevailing in the United States. The forests of the Southern States and the Pacific coast contain immense quantities of other timber which might be substituted for white pine; but it is only a question of time when they will be as recklessly attacked as the forests of the North, and when they in their turn shall be nearly exhausted.

AREA OF FORESTS IN EUROPE.—It is calculated, by those who have devoted attention to the condition of different countries with respect to their forests, that the well-being of a country is best promoted when 25 per cent of its area is left in forest. In all Europe the percentage of woodland area is a little less than 30. In Russia and Finland, it is 40; in Sweden and Norway, 34.1; in Austria, 29.1; in Germany, 26.1; in Turkey and Roumania, 22.2; in Italy, 22; in Switzerland, 18; in France, 17.3; in Greece, 14.3; in Spain, 7.3; in Holland and Belgium, 7; in Great Britain, 4.1; and in Denmark, 3.4.

AMERICAN FORESTRY CONGRESS.—The rapid waste of the forests of the United States has been for several years growing in prominence as a subject of consideration, and an increasing degree of attention has been given to the study of means for preventing further destruction of woods and remedying that which has already been made. National and State laws have been enacted to encourage the planting of trees on the prairies, where the lack of them has been felt from the beginning of settlement; but the denudation of regions once well wooded, which threatens to bring complete ruin upon them as agricultural lands, has not been opposed by any efficient legislation. Much has been done, however, by voluntary effort and association to call attention to the matter, and to start a popular movement for the protection of the forests that may result in securing practical and efficient measures. The American Forestry Association was formed

in 1875, for the advancement of the purpose, and to collect and disseminate information on the subject; it was merged, in 1882, in the newly organized American Forestry Congress. The latter organization was formed at a preliminary meeting held in Cincinnati, Ohio, in April, and an adjourned meeting held in Montreal, Canada, in August. At the Cincinnati meeting, George B. Loring was chosen president of the organization, and vice-presidents were designated for eleven districts representing geographical and botanical areas in the United States and Canada. Sections were organized on the "Use of Forests," "Conservation and Practical Forestry," "Influences," and "Education," in which eighty-five papers on topics related to the main subject were read or filed. Committees were appointed to report upon forest experimental stations, forest-fires, and injuries to forests by cattle, the best methods of tree-planting, and forestry education, and also to present memorials to State Legislatures upon the establishment of State Forestry Commissions. The meeting closed with an "arbor-day," signalized by the planting of "memorial trees" in the park, which it was hoped might help to enlist popular interest in the objects of the meeting. At the Montreal meeting, a union was effected with the American Forestry Association; the constitution of the Congress was completed and adopted; and fifty-eight papers were read or filed. The Congress, by resolution, declared it to be its duty to draw the attention of the national and State governments to the necessity of protecting effectually the forests against fires; and a committee appointed to carry this resolution into effect made arrangements for the preparation of especial papers on forest-fires and on the white pine. Action was taken to encourage the formation of local forestry associations.

**LEGISLATIVE ENCOURAGEMENT OF TREE-PLANTING.**—By the "Timber Culture Act" of the United States, as amended in 1878, a head of a family, who is twenty-one years of age, may, upon the payment of fees amounting to about fifteen dollars, enter upon not more than 160 acres of prairie-land or land otherwise devoid of trees, for the cultivation of timber. He must then break five acres of the land and cultivate it, during the first year after entry; five acres more during the second year, and in the third year must plant with trees, tree-seeds, or cuttings, the five acres first broken, and so on, till one fourth of the tract has been thus put under cultivation. At the end of eight years, or within five years afterward, upon showing that he has put the required amount of land under the cultivation contemplated, and has planted it with suitable trees not fewer than 2,700 to the acre, of which not fewer than 675 to the acre are living and thrifty, he is entitled to a patent for the whole tract he has entered, upon payment of an additional fee of four dollars. A list of trees suitable to be

planted is specified in the law, which the department has declared to be intended only as a general guide, and not designed to exclude any trees recognized in the neighborhood as of value for timber, or for commercial purposes, or for fire-wood and domestic use. Of the various State laws that have been enacted to encourage the planting of trees, that of Iowa is regarded as well adapted to the purpose. It provides that for every acre of forest-trees planted and cultivated for timber within the State, the trees on which are not more than twelve feet apart, and are kept in a healthy condition, the sum of one hundred dollars shall be exempted from taxation. A law passed in Canada in May, 1882, provides that for every acre of land planted in trees the planter, being the owner or tenant thereof, shall be entitled, after the trees have been planted for three years, and shown to be in a vigorous and healthy state, and provided the land is securely fenced against both sheep and cattle, to receive a land-order for the purchase of other land, not exceeding twelve dollars in value. No land, however, can be acquired under this law, except it be of at least fifty and not more than a hundred acres in extent. If the plantations are not sufficient to fulfill this condition, the defect may be made up in money. A law of the Province of Quebec, passed in 1882, imposing restrictions upon the firing of wood in forests, limits the time in which brush may be burned for clearing lands to between the 1st of July and the 1st of September. In the State of Maine the practice now prevails of cutting out only the large trees from the woods and carefully protecting the remainder. This allows the forests to be profitably worked at stated periods of from fifteen to twenty years, and insures their permanence. A forestry commission has been appointed in New Hampshire, and has already instituted measures for collecting information relative to the clearing of the forests of the State, and the injury caused thereby to the water-supply. A similar commission has more recently been appointed by the Legislature of Vermont, and is instructed to investigate the whole subject of the condition of the forests, and the measures needed for their protection.

**SPECIES FOR FOREST-PLANTING.**—The kinds of trees which it is found most profitable to plant vary with the locality. For the prairies and plains of Kansas and Nebraska the cottonwood and black walnut are most in favor for general purposes, and next to these the box-elder and some kinds of maples. The cottonwood fixes itself readily in the soil, grows with great rapidity, and is good for fire-wood and for general domestic purposes. It has also been found to be very useful in furnishing a shelter for the more delicate species which may be destined ultimately to be more valuable; and, at whatever age it is cut, it always makes a good return for the care that has been

expended upon it. The black walnut grows well in the prairies, and is one of the most valuable timber-trees. In many of the older States, the undergrowth which springs up after the original woods have been cut away is found to be capable of becoming an excellent forest if it is taken care of and trimmed. A growth representing a large variety of hard-wood and coniferous trees is springing up in some parts of Michigan from which the forests have been cut, which might ultimately be made as valuable as the original woods. Not all the land from which the trees are cut is, however, capable of spontaneously producing a useful second growth. Replanting with white pine is recommended for Michigan. Among the less common trees, the catalpa and the ailantus are recommended as good growers, and as furnishing durable wood, and wood suited to domestic uses.

**SUCCESSFUL AND EXPERIMENTAL PLANTATIONS.**—Some of the most conspicuous examples of successful forest-planting may be seen in the dunes and Landes of Southwestern France. The dunes, shifting sand-hills extending for a hundred miles along the coast between the Gironde and the Adour, were planted toward the end of the last century with the maritime pine, and have now become fixed forests 148,200 acres in extent. The Landes, an extensive waste tract of swamps and sands, infested with miasmatic fevers, were subjected about thirty years ago to a process of drainage, and were planted with trees. They now constitute a million and a half of acres of maritime-pine lands; they furnish abundantly fire-wood, charcoal, staves, telegraph-poles, posts, railway-ties, mining-props, hewed timber, and sawed lumber, and yield large supplies of turpentine under a system of collection that does not exhaust the trees; and the former wretched, half-barbarous inhabitants have become an industrious, enterprising, and thrifty population. At Larchwood, Iowa, a plan has been experimentally adopted of planting the central forty acres of each section of land with forest-trees, by which each tract of one hundred and sixty acres is given a wood-lot of ten acres, and promises well, both for the growth of the trees and the provision of the land. Another experiment has been made on the shores of Lake Michigan, near Waukegan, Ill., of planting five hundred acres of waste, marsh, and sandy land, with Scotch, Austrian, and white pines, ailantus, and catalpa.

**LUMBER INDUSTRIES OF THE UNITED STATES.**—A table of statistics of the lumbering industries of the United States for the year ending May 31, 1880, shows that there were produced during that year, at 25,708 establishments, 18,091,353,000 feet of lumber (board-measure), 1,761,788,000 laths, 555,504,000 shingles, 1,248,226,000 staves, 146,523,000 sets of headings, 34,076,000 feet of spool and bobbin stock (board measure), and other products to the value of \$2,682,668. The value of the logs

consumed in making these goods was \$139,836,869; the total value of all the products was \$233,367,729. The capital invested in the factories was \$181,186,122. The business was most extensively carried on in Michigan, where \$39,260,428 were invested, and the value of the products was \$52,449,928, while the largest number of establishments (2,827) was in Pennsylvania, which stood second (\$22,457,359) in value of products. The third State in respect to value of investments and products was Wisconsin, where \$19,824,059 of capital were employed, and the total value of the products was \$17,952,347.

**CONSUMPTION OF FOREST PRODUCTS AS FUEL.**—A partial estimate of the consumption of forest products as fuel in the United States during the census year has been published by the Census-Office. The total amount of wood consumed is given at 145,778,187 cords, and its value is fixed at \$321,962,373. The table shows, further, that 74,008,972 bushels of charcoal were consumed, the value of which was \$5,276,736. Of the wood, 140,537,439 cords, the value of which was \$306,950,040, were consumed for domestic purposes; 1,971,813 cords, valued at \$5,126,514, by railroads; 787,862 cords, valued at \$1,812,083, by steamboats; 1,157,522 cords, valued at \$3,978,331, in the manufacture of brick and tile; 624,845 cords, valued at \$3,548,285, in mining and amalgamating the precious metals, and other mining operations; and the rest in the manufacture of salt and wool.

**FUEL-VALUE OF DIFFERENT WOODS.**—A determination of the fuel-value of some of the more important woods of the United States, made by the Forestry Bureau of the Census Department, represents the results of analysis and experiments upon fifty-five species, natives of all parts of the country. The most valuable species for fuel by volume is the mountain mahogany (*Cercocarpus ledifolius*) of the Pacific coast, and it is followed by the Southern long-leaved pine (*Pinus australis*), shell-bark hickory, chestnut-oak, pitch-pine, and other varieties of hickory, pine, oak, and hard-wood trees.

The different species of oak, however, vary widely in their value by volume. The most valuable tree, by weight, is the Southern pine, and it is followed by the pitch and yellow (*mitis*) pines, cypress, yellow pine (*ponderosa*), of the Pacific region, and other conifers; and among the broad-leaved trees, the mesquite (11), sugar-maple (12), aspen (13), cotton-wood (15), and white ash (17). The least valuable woods in volume, among the Atlantic species, are hemlock, aspen, black spruce, white pine, tulip-tree, and yellow or white cedar (*Thuja occidentalis*). The least valuable in respect to weight are the persimmon (50), black oak (*Quercus tinctoria*) (51), tulip-tree (52), water-oak (*Quercus aquatica*) (53), black-jack (*Quercus nigra*) (54), and the white oak of the North Pacific (*Quercus Garryana*) (55).

FRANCE, a republic of Western Europe. The third republic was established by proclamation September 4, 1870. By the law of February 25, 1875, the legislative power is vested in the two Houses of the National Assembly, the Chamber of Deputies and the Senate. The deputies are elected by universal suffrage for the term of four years. Under the law of the *scrutin d'arrondissement*, passed November 11, 1875, each *arrondissement* of under 100,000 inhabitants elects one deputy. An additional deputy is allowed if the population exceeds 100,000, two if over 200,000, and so on. The Chamber of Deputies contains 557 members. The Senate is composed of 300 members, 75 of whom are appointed for life, the vacancies being filled as they occur by the Senate. The rest are elected for nine years, one third of them retiring every three years. They are appointed by an electoral college, to which each commune and municipality sends a member. The National Assembly meets annually on the second Tuesday in January, unless summoned earlier by the President, and remains in session at least five months. An extraordinary session can be called by the President on his own motion, or upon the demand of one half the members of each House. The President can order an adjournment for not more than one month and not oftener than twice in one session. The President of the Republic is elected for the term of seven years by a majority of the votes of both Chambers united in joint session. The President, as well as either Chamber, can initiate legislation. With the approval of the Senate the President can dissolve the House of Deputies. The President promulgates the laws and sees to their execution. He has control of the military forces, and makes all appointments, civil and military. The Ministers are collectively responsible for the general policy of the Government to both Chambers. The President can only be removed for high-treason.

The President of the French Republic is Jules Grévy, born August 15, 1808. He was elected January 30, 1879.

AREA AND POPULATION.—In the census of December 18, 1881, the total population of France was found to be 37,672,048. The total area is 528,571 square kilometres, or 203,285 square miles. Before the separation of Alsace and Lorraine the area was 543,051 square kilometres, and the population, at the census of 1866, 33,067,064. In 1872 the population was 36,102,921; in 1876, 36,905,788. Of the total population, 36,069,524, or 97.74 per cent, are of French birth; 801,754, or 2.17 per cent, foreign citizens; and the remaining 34,510 naturalized citizens. Of the foreign population 374,498 are Belgians, 165,313 Italians, 62,437 Spaniards, 59,028 Germans, 50,208 Swiss, 30,077 English, and 9,855 Americans. In respect to religion 35,387,703, or 98 per cent, are Catholics; 580,757, or 1.6 per cent, Protestants (Calvinists 467,531, Lutherans 80,117,

other confessions 33,109); 49,439, or 0.14 per cent, Israelites; 3,071 of other non-Christian faiths; and 81,951, or 0.23 per cent, of no religion. In the departments of Drôme, Doubs, Deux-Sèvres, Ardèche, and Lozère from 10 to 15 per cent, and in Gard 28 per cent of the population are Protestants. In 1880 the number of marriages was 279,035, against 282,776 in 1879, 279,650 in 1878, 278,094 in 1877, and 291,393 in 1876; the number of births, including still-born, was 961,914, against 980,404 in 1879, 980,590 in 1878, 987,963 in 1877, and 1,011,362 in 1876; the number of deaths, including still-born, was 900,074, against 883,757 in 1879, 882,349 in 1878, 845,343 in 1877, and 878,754 in 1876; and the excess of births over deaths was 61,840 in 1880, against 96,647 in 1879, 98,241 in 1878, 142,620 in 1877, and 132,608 in 1876. The total emigration in 1877 was 3,666, of which number 917 departed for Buenos Ayres, 890 for Algeria, and 550 for the United States. The towns of over 30,000 inhabitants in 1881 were the following:

Paris.....	2,269,028	Dijon.....	55,458
Lyons.....	376,618	Le Mans.....	55,347
Marseilles.....	360,099	Tours.....	52,209
Bordeaux.....	221,305	Tourcoing.....	51,895
Lille.....	178,144	Grenoble.....	51,371
Toulouse.....	140,289	Versailles.....	48,324
Nantes.....	124,319	Troyes.....	46,067
St. Etienne.....	123,513	St. Quentin.....	45,888
Rouen.....	105,906	Boulogne.....	44,542
Le Havre.....	105,567	St. Denis.....	43,895
Reims.....	93,328	Clermont.....	43,038
Roubaix.....	91,757	Beziere.....	42,915
Amiens.....	74,170	Caen.....	41,503
Nancy.....	73,225	Bourges.....	40,217
Toulon.....	70,103	Lorient.....	37,512
Angers.....	68,049	Avignon.....	37,657
Nice.....	66,279	Dunkerque.....	37,323
Brest.....	66,110	Poitiers.....	36,210

Orléans.....	57,264	Angoulême.....	32,567
Besançon.....	57,067	Perpignan.....	31,735
Montpellier.....	56,005		

There were in 1881 6,158 post-offices. The mails carried 569,910,358 letters, 32,224,239 postal-cards, 11,327,262 letters with inclosures of declared value, 345,364,572 newspapers, and 378,075,770 samples and circulars. The receipts amounted to 123,472,000 francs, and the expenses to 81,898,988 francs.

The number of telegraph-offices in 1881 was 5,841. The length of the state lines at the end of 1881 was 73,878 kilometres, of which 685 kilometres were under-ground, 3,452 submarine, and 103 pneumatic. The length of wires was 233,057 kilometres, 12,521 of which were under-ground and 3,663 submarine. The number of dispatches sent in 1881 was 17,514,147 domestic and 1,952,017 international. The receipts were in 1881 25,612,399 francs, expenses 32,222,642 francs.

The number of kilometres of railroad in operation on the 1st of January was 1,999 belonging to the Government, 21,753 belonging to unchartered companies, 1,515 to companies, and 2,152 of local lines.

COMMERCE.—The special imports in 1881, that is, all non-dutiable goods and those on

which duties have been paid, amounted to 4,946,400,000 francs, as compared with 5,033,200,000 francs in 1880, 4,595,200,000 francs in 1879, 3,536,700,000 francs in 1875, an average of 3,342,500,000 francs between 1869 and 1873, and of 2,121,100,000 francs between 1859 and 1863. The special exports, that is, domestic products and foreign exports on which duty has been paid, amounted to 3,612,400,000 francs in 1881, 3,467,900,000 francs in 1880, 3,872,600,000 francs in 1875, 3,259,700,000 francs average between 1869 and 1873, and 2,271,000,000 francs between 1859 and 1863. The specie imports in 1881 amounted to 363,200,000 francs, the exports to 302,200,000 francs. Of the total imports of 1881, 2,188,982,000 francs were articles of consumption, of which 583,696,000 francs were cereals (against 844,343,000 francs in 1880), 383,424,000 francs fermented liquors, 288,534,000 francs colonial produce, 29,427,000 francs tobacco, 285,638,000 francs seeds, fruits, and vegetables, and 363,884,000 francs animal food articles and animals (against 419,987,000 francs in 1880). The exports of articles of consumption amounted to 915,856,000 francs, against 865,601,000 francs in 1880. The imports of raw materials in 1881 amounted to 1,893,130,000 francs, against 1,856,586,000 francs in 1880, the imports of textile materials in 1881 being 1,063,963,000 francs; of woods, etc., 245,479,000 francs; of hides, hair, and leather, 185,364,000; of raw metals, 140,724,000 francs. The exports of raw materials amounted to 554,125,000 francs, against 540,073,000 francs in 1880, the exports of textile materials making the chief item and amounting to 384,844,000 francs. The imports of manufactured articles amounted to 558,042,000 francs, against 490,957,000 francs in 1880, the principal items being textiles (241,577,000 francs), and machines and metallic products (131,002,000 francs). The exports of manufactured objects amounted to 1,787,313,000 francs, against 1,736,975,000 francs in 1880, the largest items being textiles and articles of dress (948,993,000 francs), leather manufactures, etc. (290,223,000 francs), jewelry and works of art (148,919,000 francs), and metallic products, machines, etc. (145,385,000 francs). The other classes of imports amounted to 555,673,000 francs, exports to 355,148,000 francs.

The largest foreign trade is with England, amounting to 599,000,000 francs of imports and 830,200,000 of exports in 1879. The largest import trade is with the United States, from which 715,900,000 francs of imports were received, and to which 276,200,000 francs of exports were shipped. The total trade with the French colonies amounted to 227,100,000 francs of imports and 190,400,000 francs of exports.

The number of vessels entering French ports in 1881 was 34,520, of 11,675,746 aggregate tonnage, of which 9,966 carried French colors, tonnage 3,721,714; the number departing was 23,373, tonnage 7,527,146—8,072 of 3,358,136 under French colors. The merchant marine

at the beginning of 1881 consisted of 14,406 sailing-vessels, of 641,539 tons, and 652 steamers, of 277,759 tons. Of the total number of 15,058 vessels, of 919,298 aggregate tonnage, employing 92,397 persons, 9,987, of 134,983 tons, crews 54,928 persons, were engaged in fisheries; 2,399, of 111,599 tons, in coasting; 1,743, of 643,406 tons, crews 24,843, in ocean commerce; and the remaining 929 were vessels employed in port service and yachts.

**COLONIES.**—The principal colony of France is Algeria, having an area of about 430,000 square kilometres, and a population in 1877 of 2,867,626 souls. The population of the three civil departments in 1877 was 1,551,109, their area 41,599 square kilometres. In 1880 their boundaries had been extended to include 73,835 square kilometres, and a population of 1,884,124 souls. The population of Algeria is divided in respect to nationality into 198,092 French, 33,506 naturalized Israelites, 2,477,641 native Mussulmans, and 158,387 from other countries, among them 94,038 Spaniards, 26,322 Italians, and 14,313 English. The three capital cities are Algiers, containing in 1880 64,714 inhabitants; Oran, containing 59,429; and Constantine, containing in 1876 89,823.

PRINCE NAPOLEON (JEROME).

The area and population of the colonies and protectorates, exclusive of Madagascar, with an area of 691,901 square kilometres, and a population estimated at 5,000,000, and Tunis, with an area of 118,400 square kilometres, and a population of about 3,000,000, together with the exports and imports of the colonies other than Algeria, in 1879, and their budgets for 1882 (all in thousands of francs), are given in the following table:

COLONIES.	Square. kilometres.	Population.	Imports.	Exports.	Budgets.

Of the colonial expenditures of 1879, the French Government furnished in subventions 1,253,000 francs, leaving 37,799,000 francs as the amount raised in the colonies.

**TUNIS.**—The Treaty of Kas-el-Said, made May 12, 1881, provided for a French protectorate over Tunis, which was completed by the laws of April 22, 1882. The different departments of the public service undertaken by the French Government in Tunis are placed under the direction of the corresponding ministries in France, which give their directions to the minister resident at Tunis. The Bey Mohammed-es-Sadok, who was born in 1813 and succeeded his brother Mohammed September 28, 1859, died October 28th. He was succeeded by his younger brother, Sidi Ali, born in 1817. The French minister resident who succeeded to M. Roustan is M. Cambon. The area of the regency of Tunis is 116,348 square kilometres, the population about 2,100,000, including some 45,000 Israelites and 25,600 Christians. The public debt has been reduced by the European commission, which was given control of the finances, to about 125,000,000 francs. The revenue, derived from export duties, tax on olive-trees, salt and tobacco monopolies, etc., was, in 1875, 6,832,300 francs, nearly all of which was applied to the service of the debt.

**ARMY AND NAVY.**—Universal military service was established by the law of July 27, 1872, by which every Frenchman is obliged to belong to the active army for five years, to the active army reserve four years, to the territorial army five years, and to the territorial army reserve six years. The effective of the army in 1882 was as follows: Infantry—144 regiments of the line, of four active battalions, of four companies each, and two companies at the depot, numbering 288,464 men; thirty battalions of rifles, or chasseurs, numbering 17,730 men; four regiments of zouaves, numbering 10,480 men; three regiments of Algerian sharpshooters, numbering 8,493 men; the Foreign Legion in Algiers, numbering 2,526

men; three battalions of light infantry in Algiers, numbering 4,140 men; and fusiliers and pioneers forming the corps of instruction, numbering 1,330 men; altogether 283,163 officers and men, with 2,631 horses. Cavalry—twelve regiments of cuirassiers and twenty-six of dragoons, and twenty regiments of chasseurs and twelve of hussars, of five squadrons each, numbering altogether 58,240 men, with 51,800 horses; four regiments of Chasseurs d'Afrique, numbering 4,152 men, with 3,720 horses, and three regiments of Spahis, numbering 3,477 men, with 3,423 horses; nineteen squadrons of scouts to be formed in time of war; and eight companies for the remounting service, numbering 3,038 men, with 80 horses; total effective force 68,907 men, with 59,023 horses. Artillery—nineteen regiments organized in division and nineteen attached to corps, together 57 battalions of foot, 304 of mounted and 57 of flying artillery, and 76 of mounted artillery at the depots, numbering together 55,717 men, with 30,381 horses; and the corps for pontoon-service, repairing, the artillery train, etc., making the total effective force 68,762 men, with 33,298 horses. Engineers—11,007 men, with 945 horses. Train—9,540 men, with 8,918 horses. Staff and administrative troops—27,990 officers and men, with 4,888 horses. Gendarmerie—26,511 men, with 13,013 horses. The total effective of the French army is 495,880 men, with 122,716 horses. The war effective numbers 2,423,164 men, organized in 24 complete corps in the first line, and 8 corps in the second line; to which number may be added about 1,330,000 excused or non-combatants. By a law introduced July 26, 1882, the African army is to be increased, by which the active army will receive an augmentation of 23 infantry battalions, 18 squadrons of cavalry, 15 batteries of artillery, and a corresponding number in the auxiliary services. The French infantry is armed with the Gras rifle, a species of Chassepôt with metal cartridges. The artillery has cast-steel breech-loading guns of 80 and 90 millimetres' caliber.

The French navy in 1881 numbered 356 vessels, classified as follows: 59 ironclads, comprising 20 of the first class and 12 of the second class for offensive and defensive warfare, and 27 for coast-defense, including 11 floating batteries; 235 steamers, comprising 57 cruisers, 17 dispatch-vessels, 22 fleet dispatch-boats, 21 gunboats, 61 transports, 26 small gunboats, 31 torpedo-boats, and 62 sailing-vessels. There were in construction 8 first-class ironclads, 2 second-class ironclads, 2 ironclad gunboats, 11 torpedo-boats, and 22 other vessels. The navy is manned with 1,585 officers and 41,227 seamen, 3,940 men in the special services, 18,870 marine infantry, and 4,661 artillery. The heaviest ironclads are the *Devastation* and the *Foudroyante*, each of 9,600 tons and 4,200 horse-power, carrying 14-inch armor and four 38-ton and two 25-ton guns. The *Amiral Duperré* has 12-inch plates and is armed with four 38-ton guns. Six new steel-clads with horizontal plates 11½ inches thick carry two 38-ton guns each, mounted in barbette. Five others of the ironclads are of modern types and heavily armed, while the rest of the vessels classed as ships of combat are of obsolete construction.

**FINANCE.**—The sources of revenue at the disposal of the French Government have expanded remarkably in the last fifty years. After the Franco-German War, the augmentation of the debt and the increased cost of the army necessitated a large increase in taxation. In the year 1869 the total revenue of the Government amounted to 1,798,193,568 francs. In 1873 the total revenue was 2,467,470,630 francs; the expenditure 2,374,804,134 francs. In 1881 the budget of revenue was 3,214,534,789 francs, and of expenditure 3,213,806,317 francs. The budget estimates for 1883 place the total receipts at 3,561,977,092 francs, and the total disbursements at 3,573,349,646 francs. The following are given as the sources of revenue: Direct imposts, 378,100,500 francs, of which 175,500,000 is the estimated product of the land-tax, 63,765,000 francs of personal taxes, 43,772,400 of the tax on doors and windows, and 95,062,100 of patent dues; special taxes of similar character to direct taxes, such as taxes on mortmain property, on carriages, inspection of weights and measures, etc., 24,723,840 francs; registration fees, stamps, and domains, 771,661,000 francs, registration producing 593,827,000, stamps 159,607,000, and the domains, exclusive of forests, 18,227,000 francs; forests, 35,188,900 francs; customs and salt-tax, 404,142,000 francs; indirect taxes, 1,099,306,000 francs, of which 428,309,000 francs come from the tax on drinks, 101,548,000 francs from domestic sugars, 16,139,000 francs from matches, 12,841,000 francs from paper, 92,933,000 francs from railroad traffic, being 20 per cent of passenger receipts; sale of tobacco, 360,437,000 francs; of gunpowder, 15,236,000; post-office, 128,325,000 francs; tele-

graphs, 30,629,000 francs; 3 per cent on incomes from dividends, etc., 47,118,000 francs; revenue from Algeria, 31,380,008; tax on civil pensions, 21,262,000 francs; universities, 3,593,665 francs; fines, 7,534,181; various receipts, 49,866,998 francs. The following are the main branches of expenditure: Public debt, 1,317,112,874 francs, of which 741,070,255 francs are interest on the funded debt, 27,088,000 on temporary loans, 160,000,618 pensions, and 388,954,001 capital payments; dotations, 24,712,456 francs, of which 13,724,000 go to pension the invalids of the navy, and 9,788,456 to the members of the Legion of Honor; legislation, 11,735,780 francs; Ministry of Justice, 35,944,642 francs; of Public Worship, 52,929,306 francs; of Foreign Affairs, 14,348,900 francs; of the Interior, 68,813,655 francs, of which 14,661,550 francs are for expenses of administration, 13,763,537 for public safety, 20,690,961 for prisons, and 10,436,235 for charities; of Finance, 19,558,470 francs; of Posts and Telegraphs, 2,122,360; of War, 584,106,000 francs; of Marine and the Colonies, 237,187,470 francs, of which 204,898,519 francs are for the navy; of Public Instruction and Art, 151,050,196 francs, of which 184,410,451 francs are for education, and 16,639,745 for the fine arts; of Commerce, 21,918,564 francs; of Agriculture, 24,397,350 francs; of Public Works, 139,488,541 francs, of which 89,725,661 francs are for the ordinary service, 49,762,860 for extraordinary works, 317,621,582 for the cost of the *régie*, collection of taxes, post-office, etc., and 21,155,500 for drawbacks and restitutions. There are besides 529,146,000 francs of estimated revenues and expenditures treated of apart from the general budget as extraordinary.

The public debt in 1879 stood at 19,862,035,983 francs, of which 12,101,352,167 francs bore interest at 3 per cent, 6,917,470,240 francs at 5 per cent, and the remainder at 4½ and 4 per cent. The number of holders was 4,380,933, of whom 2,432,574 held the 5 per cent rentes, and 1,788,114 the 3 per cent.

The total cost of the war and foreign occupation of 1870-'73 amounted to 9,287,882,000 francs, of which 5,000,000,000 was the war indemnity to Germany, 1,873,238,000 the war expenditures, 302,065,000 the interest on sums due to Germany, 631,168,000 disbursements in connection with the loans of 1870-'72, 364,189,000 loss from non-payment of taxes during the war, 248,625,000 the cost of maintaining the German army of occupation, 169,518,000 the cost of provisioning Paris, 61,708,000 repayments of fines levied by Germans, 50,000,000 grants to soldiers' families, 38,807,000 cost of foreign occupation of 1871-'73, and 548,564,000 miscellaneous expenses.

The indebtedness of the departments and municipalities was largely increased during the war. The budget of the city of Paris for 1880 estimates the revenue at 233,102,579 francs, of which 125,398,041 are from *octrois*, or tolls

on articles of consumption, and the expenditure at 231,041,489 francs, most of which goes for interest and sinking fund on the debt of 2,295,000,000 francs.

**POLITICS AND LEGISLATION.**—The history of the events of the year in France dates properly from the fall of the Ferry Ministry in November, 1881. The Tunisian expedition had been conducted nearly to a successful termination, but at a terrible cost of lives and treasure. Suspicions of the influence of private speculations on the course of events in Tunis, rumors of personal differences and intrigues in the army, and, most of all, the sufferings of the troops and loss of life caused by the inefficiency of the hospital service and commissariat, had brought the Cabinet into actual odium. The public were alarmed for the republic when a Government, representing the republicanism which had trampled upon the sentiments and traditions of the religious community, and driven the clerical element over to the monarchical minorities, was unable to prevent corruption in high places, and when the army, which is the subject of the most anxious solicitude with all parties, was found as disorganized and mismanaged as when the military forces of the empire collapsed in the German War. The time was come when Gambetta, who was looked upon as the guardian and guiding spirit of the republic, and who had overshadowed every ministry formed since the victory of republican principles in the presidency of MacMahon, must assume the responsible direction of affairs. The hopes of France were centered upon the great orator and Republican leader, who, when he exerted his full political strength, was to compose the faction fights and personal rivalries of the Republican party, and, as the permanent head of the Government, pursuing a continuous policy, to enable France to assert her due position in Europe, which, with ephemeral ministries and a constantly changing policy, was impossible.

When the Assembly met on October 28th, Gambetta tested his strength by again standing as a candidate for the presidency of the Chamber, and was elected with the overwhelming majority of 317 to 47. Jules Ferry himself precipitated his fall by attempting an explanation of Tunisian affairs without waiting for an interpellation. In the debate which followed, the ministers were accused of deceiving the Assembly for electioneering purposes, and with weakening and disorganizing the army by allowing the generals to make up the first Tunisian expedition with troops selected from the different corps. Clemenceau charged Roustan with having instigated the Government to interfere in Tunis in order to further certain financial enterprises. The outcome of the long debate was the adoption, on the motion of Gambetta, of a neutral order of the day which simply approved the Bardo Treaty. Jules Ferry, having failed to obtain the desired expression of confidence, resigned November 10th,

and Gambetta was invited by M. Grévy to form a ministry. Gambetta at first set about forming the "grand ministry" that his organs had heralded, which was to unite the Republican forces in a stable union. But Léon Say, De Freycinet, and Challemel-Lacour declined his overtures. He then made up a list from among his immediate supporters. Dismay and ridicule were excited by the production of the names. Except two retained from the last Cabinet—Cazot, Minister of Justice, and Cochéry, of Posts and Telegraphs—all were new men. The names of the other ministers were: Waldeck-Rousseau, Interior; Allain-Targé, Finance; General Campenon, Military Affairs; Gougeard, Marine; Paul Bert, Education and Worship; Raynal, Public Works; Devès, Agriculture; and Proust, Arts. Gambetta took the department of Foreign Affairs. The appointment of Paul Bert, eminent as a scientific scholar, but best known as an exponent of skepticism, to the post of Minister of Public Worship, was deemed by many a direct insult to the Catholic Church, and regarded everywhere with wonder. The ministerial declaration of principles given in the Assembly on November 15th aggravated the evil impression created by the appointment of M. Bert, and the prospect of a destructive campaign against the Catholic ideas of the function of the Church in the body politic. From the manner of the programme it was suspected that Gambetta had interpreted the national demand for the "formation of a united government, free from the conditions of internal weakness and dissension," not by seeking the co-operation of the other lights of the Republican party, but by assuming the sole direction of the destinies of the nation. The conservative elements were disturbed by the announcement of indefinite constitutional changes, while the radical democracy had long ceased to put their faith in Gambetta. He foreshadowed the reform of the Senate "by wisely limited alterations in the organic law, which would bring the political power into completer harmony with the democratic genius of French society." The reform of the judiciary, the extension of national education, the completion of the military laws, the conclusion of commercial treaties, the strict application of the Concordat so as to insure respect for the political authority in the relations between the Church and the state, and the rigid preservation of order at home and maintenance of peace with dignity abroad, were the other articles of the profession of faith. The programme of the ministry was confidently declared to be that of France. An active opposition on the Extreme Left, and the uncertain attitude of other sections of the Republican party, boded ill for the ministry; but the Chamber waited until their policy was developed. In the departmental activity of the ministry, M. Proust's petty projects excited ridicule, while the new regulations announced by Minister Bert confirmed the gravest fore-

bodings. He admonished certain bishops who had visited Rome that they should obtain leave of the Government before absenting themselves from their dioceses. He announced that prelates ordained in the future would be required to subscribe to the oath prescribed by the Convention of 1801.\* Prefects were requested to furnish reports of the character and antecedents of prelates, and the office of Director-General of Worship was abolished. The Duc de Broglie, in the Senate, accused the Republicans of dissimulation in their Tunisian policy, while, out-of-doors, the testimony in a libel-suit brought by the public prosecutor against Rochefort for his attack upon M. Roustan, and the acquittal of Rochefort, made a damaging impression. With Tunis still far from being pacified, with the question of Senate reform and other measures already announced yet to be settled, with a battle raging between the free-traders and the protectionists over the commercial treaty with England, and after taking a position in Egypt which would entail military intervention, Gambetta, as though aiming to be dictator or nothing, announced the re-introduction of the project of the *scrutin de liste*. Under this system Napoleon III kept up his majority in the Chamber. Instead of each arrondissement electing its own deputies, all the deputies for a department would be voted for on one ticket throughout the department. This favorite scheme of Gambetta's had been rejected by the Senate the preceding June. In the triennial senatorial election on January 8th, the Republicans gained twenty-five seats. Every one but Gambetta saw the difficulty of inducing the Chamber now to change the electoral law under which it had just been elected; yet his organ, the "*République Française*," declared that he would resign if the measure failed to pass. On January 14th it was introduced, coupled with the plan for the revision of the senatorial election law. Instead of allowing petty villages equal representation in the electoral college with the great cities, he proposed to give each municipality a delegate for every five hundred registered voters; and, in the case of the life-Senators, that their term should be reduced to nine years, and that both Chambers should participate in their election. He also proposed to take away the right of the Senate to vote upon financial measures, except in the way of a protest. The committee of the Chamber reported against the *scrutin de liste* section of the proposed electoral law, and on January 26th the Chamber of Deputies rejected a resolution of M. Gambetta in favor of the revival of the collective ticket by two-thirds majority.

Gambetta immediately handed in his resig-

\* "I swear and promise to God, on the holy gospels, to remain obedient and faithful to the Government established by the Constitution of the French Republic. I promise also to have no dealings, to attend no councils, to carry on no league, either at home or abroad, which are contrary to public tranquillity; and if, in my diocese or elsewhere, I learn that anything is being concocted to the prejudice of the state, I will inform the Government thereof."

nation. M. de Freycinet was called upon to form a ministry. He obtained as colleagues the well-known and trusted statesmen of the party. He himself resumed the portfolio for Foreign Affairs, which he had resigned eighteen months before, mainly through Gambetta; Léon Say took the Ministry of Finance, and Jules Ferry that of Public Instruction and Worship; Admiral Jauréguiberry became Minister of the Marine, Varroy of Public Works, and Tirard of Commerce. The members of the new Cabinet who had not held ministerial positions before were Goblet, Minister of the Interior; Humbert, of Justice; Mahy, of Agriculture; and General Billot, of War. The Ministries of Agriculture and of Fine Arts had been created by Gambetta, and the latter was now discontinued.

The policy announced contrasted with the combative and disturbing departure of Gambetta, the main aim being "to make peace prevail in the country, peace in men's minds as well as in the material order of things, peace both at home and abroad." The revision of the electoral laws was postponed, while the reforms in the magistracy, the military service, the laws of liberty of association, and in national education, were to be prosecuted with energy.

During the tranquil ministry of De Freycinet several important measures were carried through. The right of electing their mayors was restored to communes and municipalities, with the exception of Paris. The Radicals cried out against the exclusion of Paris, but the moderate men were not ready to make this concession, involving the patronage of 20,000 offices, to the oft repeated demands of the Parisian democracy for local self-government. A bill to abolish the Concordat was taken into consideration. The principal act of the session was the primary education law (see EDUCATION AND ILLITERACY). The amendment added in the Senate the previous session by Jules Simon, requiring schoolmasters to instruct pupils in their duty toward God and their country, which the Chamber had refused to accept, was now struck out by the Senate freshly recruited with Republicans. The policy of the Government, not being as pacific in religious matters as in other fields, was subjected to sharp attacks from the clerical forces. Monseigneur Freppel, Bishop of Angers, the clerical leader, opposed a grant for the continued occupation of Tunis, and elicited an explanation to the effect that the troops had been reduced from 45,000 to 35,000, and that 5,000 more would soon be withdrawn. There was a struggle over a law allowing a witness objecting to the oath to make a declaration on his "honor and conscience." On the reassembling in May, the Chamber passed Naquet's bill establishing a law of divorce. To prevent the resignation of Léon Say upon the passage of a bill opposed by him, a special vote of confidence was passed.

The Egyptian question found the country

unprepared in mind for any decisive course. The policy of the Government was consequently infirm and characterless. Preserving as long as possible the agreement with England, De Freycinet was warned by the exasperation and distrust produced in the country by the Tunis affair against a military intervention. He tried to shift the responsibility of the arbitrament to the councils of Europe. At the last moment he withdrew his objections to Turkish intervention. But the determining will in Europe was impelled, precisely on account of the indecision of France, to let Egyptian matters take their own course. Gambetta emerged from his retirement to urge determined action, but was unable to rally the warlike and ambitious spirit of his countrymen. Freycinet obtained a preliminary vote of credit to be used in the event of England and France being deputed by the European conference to intervene. He afterward announced that, as the powers had not invited England and France to intervene, he would not join England in reducing the rebellion, but asked, July 24th, for an additional credit to enable French marines to land on the Suez Canal to protect it in conjunction with England. This vote was refused on July 29th by a majority of 416 to 75. The ministry resigned, and the naval preparations were abandoned.

President Grévy was unable at first to find a statesman who would undertake the formation of a new Cabinet. After a delay of nine days Duclerc, a former minister, succeeded in the task. He took the portfolio for Foreign Affairs; De Fallières the Ministry of the Interior; Tirard became Minister of Finance; Devès, of Justice; Duveaux, of Public Instruction; General Billot, of War; Admiral Jauréguibery, of Marine; Cochéry, of Posts and Telegraphs; De Mahy, of Agriculture; Pierre Legrand, of Commerce and Public Works. The latter portfolio was afterward taken by Herisson. Duclerc in his programme promised to be bound by the vote against intervention, and, if events involving the interests or honor of France intervened, to summon the Assembly. He expressed as his principal aim the union of the various sections of the Republican majority. The Chambers adjourned soon after the formation of the Cabinet.

Gambetta occasionally lifted his voice on behalf of the policy which he inaugurated in the three months of his ministry, and in his newspaper advocated personal rule by the popular leader of a democratic state, which he thought necessary for the security and greatness of France. To bring about the political order which he hoped yet to establish, he gave his attention to the development of his new party of the Pure Left. During the vacation of the Chambers, which commenced immediately after the appointment of the Duclerc Ministry, there occurred no event to disturb the political quiet except some excitement among the socialists incident upon strikes and lock-outs in manu-

factories. At Montceau-les-Mines some idle workmen were instigated by politicians to violate a church because the employers with whom they were quarreling entertained clerical sympathies. At Lyons there was an equally aimless demonstration. These trifling disturbances were exaggerated, for the lack of other excitement, into a veritable terror. Government officials were partly responsible for the belief which prevailed for a time that French society was honey-combed with secret societies which were ready to attempt a social revolution. A sequel of the sensational excitement was a remarkable trial of a number of socialists who admitted spreading the doctrines called Anarchism, for which, among others, Prince Krapotkine, the leading journalist of the Russian Nihilists, was sentenced to prison.

At the very end of the year the world of French politics was thrown not merely into momentary consternation, but the republic was apparently unhinged and in danger of disruption, through the death of Léon Gambetta, whom the people mistrusted and turned against when in power. In Germany his death was welcomed as affording relief from the anxiety caused by the menaces of revenge to which he occasionally gave utterance. But the interior tranquillity of France was disturbed by the movements of the Bonapartist and royalist pretenders upon the departure of the strongest man of the republic, while the trepidation and divided councils of the Republicans illustrated the need of the stable government which the ex-Dictator of Bordeaux wished to establish and which the monarchist factions promised.

**FREE RELIGIOUS ASSOCIATION.** The receipts of the Free Religious Association during 1881 were \$1,700, and its expenditures for the same time were \$809. The report of the Executive Committee for the year gave account of the efforts it had made to obtain information from various States regarding legal restrictions on religious liberty, sectarian influences in education, social conditions as affecting free thought, and the condition of liberal organizations in those States. Correspondents were appointed for twenty-one States, and replies more or less complete were received from sixteen States. The committee found that it was the intention of the State constitutions generally to guard religious liberty, and that they assert the rights of the individual conscience in all matters of religion; but that the statutes show a conspicuous violation of the assertion, and in the Constitutions themselves it is common, in immediate connection with the assertion of the rights of private opinions and conscience, to find positive theological affirmations which discriminate in favor of the opinions of one portion of the citizens as against those of another. In some of the recently organized States, freedom of conscience was better guarded, in form as well as in substance; but in most of the States, while it was

meant to secure the equal rights of opinions and conscience, there were sections of the Constitution and laws that discriminated unfairly against the rights of some classes of citizens. These laws had, in many cases, been outgrown by public opinion and were not enforced; but they were on the statute-books, and might be, and sometimes were, resuscitated in a way to work gross practical injustice. In regard to the condition of liberal thought, the committee observed that the reports were "favorable to attempts of some kind toward a more systematic organization of the liberal sentiment of the country, without, however, indicating the method for effecting this. In a few of the States the conditions are represented as thoroughly ripe for an organizing movement, and all that is wanted is a few leaders, to point the way and rally the people, who are all ready to supply the material of the new societies. The States where the conditions are reported as most ready for organization are, in the East, Maine, Massachusetts, and the western portion of New York; and in the West, Michigan and Kansas. In the two latter States there appears to be a special receptivity to religious ideas, and a good deal of activity is already awakened in the direction of religious organization; in Michigan, largely under the auspices of a very liberal form of Unitarianism, and in Kansas under an association recently formed, called the Liberal Union, which is an attempt to solve the problem of uniting in local work and fellowship all the different phases of liberalism."

FRIENDS. The reports of numbers in the Society of Friends continue to show an increase of members in some of the yearly meetings, and a decrease in others, and, as a whole, indicate only a moderate growth. In the New England Yearly Meeting the accessions by twenty-nine births and the reception of fifty-three new members were nearly balanced by eighty-three deaths. The reports of the Indiana Yearly Meeting, on the other hand, indicate a very rapid growth in numbers. In England the society has appeared to be declining for the past twenty years, except in London, where an increase of about one thousand members has taken place during that time.

The New England Yearly Meeting met at Newport, R. I., in June. The whole number of members was returned at four thousand. The slow increase by births was accounted for in part by stating that as many as half of the members married persons who were not in the society, and the births from such marriages were not reported. A Friend, in speaking on this subject, said that his desire had been for many years that the persons thus married would ask the assistance of the Friends for their children. He thought the difficulties in the way of receiving converts into the Church ought to be removed. Now, when at any meeting converts came forward, they could not be received into the society till after a delay for presen-

tation to the next annual meeting. Another Friend thought that the old method should give way to evangelizing processes. The Friends in Indiana held a series of revival services during the winter, which continued for upward of a month, and resulted in the conversion of a considerable number of persons. The "Friends' Review," in speaking of these and other similar meetings, says that the results of the revival meetings in other churches had been scrutinized for years; and that, in the desire to revive the evangelizing power that characterized the apostles, it was thought best to institute revival services, and endeavor to teach the converts that they would stand firm when the warm influences of the meetings were withdrawn.

The subject of evangelistic or mission work was also discussed with much pains at the London Yearly Meeting. The matter was introduced in the consideration of the results of a conference on home-mission work and First-day schools, which had been held in November, 1881. It was shown at the conference that there were all over the country small, declining meetings, or closed meeting-houses; but that where adult or ordinary Sunday-schools had been established, evangelistic work had followed, the neglected classes had been attracted, and various classes had joined the society. In one case the membership of a meeting had been doubled in a few years. The conference had decided that the work of extending mission operations belongs to the Church, rather than to individual laborers or voluntary associations, and asked the yearly meeting to take upon itself the responsibility of doing it. It was also the judgment of the conference that some kind of missionary effort was really needed besides the purely voluntary labors of those who could afford to give their time to such work, and that when Friends could be found having a gift for the ministry, and willing to give up their time to the work, some provision should be made for their maintenance. The last recommendation excited much discussion in the yearly meeting. All the Friends expressed active sympathy with the mission-work; but some feared to see the society taking the responsibility for practices which were not quite in accord with its usual customs, and the idea of making provision for ministers, or for persons doing any religious work, was strongly objected to by many. Seeing how easily "making provision" might slide into payment for preaching, and depreciate the ancient testimony of the society, that the ministry is a gift of God, freely received and to be freely given, other persons viewed the proposition as a very grave one. The Women's Yearly Meeting, to whom the subject was referred separately, approved the appointment of a committee to carry out the recommendations of the conference. The Men's Meeting, after considerable discussion, agreed to a proposition to appoint a committee for one year, with a charge

carefully to guard against depreciating any of the society's testimonies, and with provisions for keeping the whole matter, in case any difficulties should arise, under the control of the yearly meeting.

The Associated Committee of Friends in the United States on Indian Affairs reported to the New England Yearly Meeting concerning its work among the ten thousand Indians of whom it has the supervision, that flourishing First-day schools and monthly meetings were maintained, with six boarding-schools, which were attended by seven hundred pupils. Several native Indians were preaching, among whom was Steamboat Frank, once a famous Modoc warrior. More than half of the ninety-six remaining members of the Modoc tribe had been converted from wild savages to quiet, peaceful Quakers. One hundred and forty-three conversions were reported.

The London Yearly Meeting met May 22d. The whole number of members was reported to be 15,113, including 435 scattered about in for-

eign countries, and showed an increase of 188 during the year. The number of regular attendants on worship not in membership was given at 5,084, showing an increase of 43. The First-day schools included 1,400 scholars. The Tract Society has issued from London 127,884 tracts, including 12,641 in foreign languages, and from Leominster 442,917 tracts. At the Foreign Missionary Meeting accounts were given of the progress of missionary work in Madagascar, Syria, and India. Agents of the society have also done missionary and evangelistic work in South Africa, Australia, and New Zealand. Meetings were held, during the sessions of the yearly meeting, of the Friends' Temperance Union, which had secured the delivery during the year of scientific temperance lectures in the public schools of the Friends and of the Friends' Good Templars; and a meeting was held to consider what Friends could do toward abating the prejudice in the United States against the negroes.

## G

**GAMBETTA, LEON MICHEL.** (See *OBITUARIES AND ANNUAL CYCLOPEDIA* for 1881.)

**GARIBALDI, GIUSEPPE**, the leader of Italian independence, died at his home, on the Island of Caprera, June 2d. He was born July 22, 1807, at Nice, before it was incorporated in the French dominions. His family was of pure Lombard stock, bearing an old Lombard name which is common in Northern Italy. His father and his grandfather were seamen. His father had come from Chiavari, in the Riviera di Levante. His mother, Rosa Ragiundo, was a woman of fine, religious nature, to whose teachings he ascribed his patriotic feelings. His education was confined to irregular lessons from religious instructors. He followed the sea from his earliest youth, making many voyages to Constantinople, Odessa, Rome, and along the Mediterranean coast, in his father's brig and other vessels. He was once taken ill at Constantinople, and found employment during his convalescence as a family tutor.

Subsequent to the revolutionary movement of 1831 he fell in with Mazzini at Marseilles, and entered heart and soul into the band of Young Italy. The scheme of an invasion of Italy by sea was given up after Mazzini's expulsion from Marseilles, in favor of an attempt to enter Savoy from Geneva. The complete failure of the Savoy expedition was attributed by Garibaldi to the treason of the Polish General Ramorino. The young Garibaldi himself had embarked on the frigate *Euridice*, with the object of stirring the crew to mutiny. He left the ship to engage in an unsuccessful plot to capture the barracks of the Carabinieri at Genoa. He made his way to Nice, and escaped thence to Marseilles.

An exile from home, he picked up a precarious livelihood by giving instruction in navigation; then sailed on voyages to the Black Sea and Tunis, and finally entered into the service of the Bey of Tunis, as an officer on one of his ships. The sailors were so unmanageable that he threw up the engagement, and embarked (in 1836) on the *Nageur* for Rio Janeiro. In South America he at first engaged in his old business of coast-trading; but on the revolt of the province of Rio Grande do Sul, and the proclamation of a republic, he transformed his little schooner into a privateer, which he called the *Mazzini*.

The twelve years' career of Garibaldi in South America forms the most romantic tale of adventure and heroism of modern times. The extremes of good and ill fortune which he went through, his wonderful resources in extricating himself from desperate perils and winning victories against fearful odds, his magnetic power of chaining to him the hearts of his followers, and inspiring them with a daring equal to his own, were crowned with epic grandeur by his disinterestedness, his humane tenderness, his generosity, his courage in doing right, without regard to consequences. His services for the abortive Republic of Rio Grande were inaugurated by a brilliant success; then followed by a gloomy disaster. With his crew of twelve men he cut out an armed Brazilian vessel; but sailing into the (as he supposed) friendly port of Montevideo, his prize was taken from him, and he was cast into a dungeon and tortured. By the intervention of the Governor of Guleaguay he was released from his tormentor. Escaping across the territory of La Plata into Rio Grande, he fought with

better success, taking fortresses by storm and beating squadrons, until misfortune again overtook him. While going to the support of the inhabitants of the Island of Santa Caterina, who were about to take part in the revolution, his ship went to pieces on a rock off the coast. Half of his crew were drowned. Not one of his seven devoted Italian comrades was saved. On this island the shipwrecked commander met the Brazilian woman, Anita, who, through all the storms and perils of his subsequent career, was ever at his side, until she succumbed to the hardships and privations which she bore like a soldier. Taking command of one of three new vessels built for the republic, Garibaldi began a new series of daring exploits. The fortunes of the republic waned at the time when Garibaldi's oldest son, Menotti, was born, on September 16, 1840. After the disastrous retreat of Las Antas, on which he was accompanied by Anita, carrying her newborn babe, Garibaldi lost heart in the ill-conducted war, and retired from the service of the Republic of Rio Grande.

He settled in Montevideo as a general broker and a teacher of mathematics. War soon broke out between the Republic of Uruguay and Buenos Ayres. Garibaldi was solicited to take a command by the Uruguay Government. He had envious rivals, however, who plotted to have him assassinated, with his friend Anzani. Through their machinations he was given a small squadron on the Parana, which was annihilated, as was intended, by a superior Argentine force. Escaping, with everything lost but honor, Garibaldi, in the darkest hour of the republic, organized his famous Italian Legion, whose blood has sprinkled a hundred battlefields in both hemispheres. The band of four hundred legionaries immediately won distinction. Garibaldi was able to announce to the Government that the victories of Boyada and San Antonio were due to their valor. They refused grants of land after the war, and were given the place of honor in every review.

In 1847, when the Pope was expected to head the cause of the deliverance of Italy from Austrian dominion, Garibaldi offered the services of his legion to Pius IX. On the 15th of April, 1848, he landed in Italy with his lieutenant Anzani, who died after landing, and

eighty-five men, leaving the rest of his guard to follow as soon as they could. The Austrians had been expelled from Milan, and the Venetians had declared their independence. Proceeding to the Sardinian King, Charles Albert, Garibaldi was coldly received. When, after the defeat at Custoza, Charles Albert accepted an armistice, abandoning Lombardy to the Aus-

GIUSEPPE GARIBALDI.

trians, Garibaldi cast his lot with Mazzini, and organized a force of five thousand volunteers, with which to engage in the "war of the people," who had been betrayed by their royal standard-bearer. The attempt to rally the people to the desperate cause was unsuccessful, and after a few skirmishes about Lake Maggiore, Garibaldi, with the remnant of his band, numbering three hundred, and in broken health, withdrew to Lugano, in Switzerland.

A few months later he was enlisted in another cause. The Romans had caused the Pope to flee, and proclaimed a republic, with Mazzini at the head. When the French troops came to re-establish the authority of the Pontiff, Garibaldi found plenty of Italians ready to engage with him in defending the national soil from the foreign invaders. He drove the French from Porta Pancrazio, April 29 and 30, 1849, and defeated the Neapolitans in the Velletri campaign. Then, in the terrible siege of Rome, many of his bravest soldiers lost their lives, and he was obliged to abandon the city to the

French on July 13, 1849. New volunteers gathered around his standard as he retired by way of Terni and Orvieto. With a force of 2,000 men he crossed the Apennines. Pressed by the Austrians in overwhelming numbers, he evaded them at San Marino, and embarked for the relief of the Venetians, who were still withstanding the Austrian siege. Intercepted by Austrian men-of-war, he was compelled to put back and land near Ravenna. In the disastrous flight through the forest, Anita broke down and died in the arms of Garibaldi. His companions, Ugo Bassi and Ciceruacchio, fell into the hands of the Austrians, who shot them without a trial. Garibaldi made his way over to the Mediterranean coast, and, broken with grief, gave himself up as a prisoner to Sardinian Carabinieri. When the hero was taken before General La Marmora he met with fraternal sympathy. The General and the Liberal party shamed the Government out of their harsh treatment of the patriot. He was given a small pension and permitted to depart for Tunis, whence, finding no refuge there nor elsewhere, he departed for New York. Until he returned in 1854 to play his part in the last act of the drama of Italian independence, he kept a little workshop on Staten Island, where he supported himself as a tallow-chandler for a couple of years, and then went to Lima, and made a voyage to China.

On his return to Italy, Garibaldi was honorably received by the Piedmontese Government, and held aloof from the Mazzinian revolutionists. He remained in his peaceful retreat on the rocky islet of Caprera, near the Sardinian shore, until the war of Piedmont and France against Austria in 1859. Garibaldi took command of the Alpine Chasseurs. He defeated the Austrians at Varese and San Fermo, bewildering the hostile commander, Urban, by the rapidity of his movements, and advancing the line of the allies in the mountains as it advanced below by the victories of Palestro, Magenta, and Solferino.

After the war, Garibaldi set about organizing the expedition of the Thousand, with which, secretly encouraged by the Government, he was to accomplish the union of North and South Italy. Embarking at Genoa on the 11th of May, 1860, he landed at Marsala, beat the Neapolitan troops at Calatafimi, and marched upon Palermo, where the Palermians rose and aided in reducing the garrison. He routed the Bourbon troops also at Milazzo. All Sicily was soon in his power, except the citadel at Messina. Crossing into Calabria, he drove the King's troops before him, entering Naples on the 7th of September, 1860. The Piedmontese now hastened to reap the success which he had prepared for them. The royal troops crossed the Marches, beat Lamoricière and the Papal troops at Castel Fidardo, crossed the Neapolitan frontier, and reduced the fortresses of Capua and Gaeta. Through their co-operation, Garibaldi was able to deliver the

two kingdoms of Sicily into the hands of Victor Emanuel. Then, declining all proffered honors and emoluments, he withdrew to his farm at Caprera.

Garibaldi felt constrained to take part in parliamentary life to secure for his officers the rank which he had conferred upon them, and to discuss the question of ceding his native city, Nice, to France. Ratazzi encouraged him to undertake an unfortunate expedition for the expulsion of the Austrians from Venice. He engaged in the still more foolhardy enterprise of rescuing Rome from the French, which was suppressed by the Minister Ratazzi, who sent the royal forces against him. He was wounded and captured at Aspromonte, August 29, 1862, and sent back to Caprera. In 1866, during the Austro-Prussian War, Venice was finally delivered from the Austrian yoke; but Garibaldi's attempt to advance into Tyrol at the head of an army of volunteers was a failure. Beaten, wounded, and ill, he returned to his hermitage in Caprera. When Ratazzi, whose treatment of the Garibaldi expedition at Aspromonte had cost him his place, again returned to power, he secretly set on foot another Roman expedition. Garibaldi and his son Menotti entered into the plans of the minister; but at Montebello and Mentana the Papal troops, with French auxiliaries which landed under De Failly, November 3, 1867, routed the patriot bands. Three years later, after the fall of Napoleon, the French garrison left Rome without the aid of Garibaldi. He joined Gambetta at Tours, on the 9th of October, 1870, to rescue the French Republic. He was beaten by the German General Werder at Montbard, and was outgeneraled at Dijon. After the war was over, Garibaldi received nothing but insult and contempt from the reactionist party which was in the ascendant at Versailles, in return for his devotion to the cause of the country for which he had fought twice at Rome.

Garibaldi took his place in the political councils of Italy to the last years of his life. But the practical statesmen of Italy sought only to use him as a tool to work out their schemes of national aggrandizement. With his democratic principles and dreams of a happier condition of society they had no sympathy, and treated him as an idle visionary.

**GEOGRAPHICAL PROGRESS AND DISCOVERY.** The attention of explorers in 1882 was principally directed to the frozen regions of the Arctic Zone, to the interior of Africa, and to the unexplored parts of Asia. The latest expeditions to the polar regions have met with failure and disaster. The physical features of the interior of Africa are now known, with the exception of one or two geographical problems to be solved. It is also known through the journeys of Cameron and Stanley, and their successors, who have penetrated to the center of the continent and traversed it from side to side in various directions, that the inner parts of Africa are re-

gions of great productiveness and commercial promise. The problem has changed from the exploration to the commercial development of Africa, as in Asia.

**THE OCEANS.**—In recent hydrographical surveys contiguous areas with very different bottom temperatures have been found in various places. In every case the bottom layer in both of the adjoining areas commences at the same depth below the surface. The phenomenon has been ascribed to submerged ridges of land arresting the circulation of water between the two areas. In the Wyville Thomson expedition two such areas were found in the Faroe Channel. An elaborate theory was advanced of a wall of still water, separating the bodies of different temperature, formed by the impact of the Gulf Stream and the cold current from the Spitzbergen seas. During the Challenger's voyage the theory of submarine barriers was advanced. The submerged ridge in the Faroe Channel has been discovered by Murray and Commander Tizard. It rises up within 200 fathoms of the surface, which is precisely the depth at which the varying bottom temperatures begin, the surface layer above the crest of the ridge having the same temperature on each side. The ridge, which is named after Sir Wyville Thomson, rises 2,400 feet above the bottom of the ocean. It is supposed to be a glacial moraine.

**POLAR REGIONS.**—The ill-fated *Jeannette*, which set sail from San Francisco July 8, 1879, under the command of Lieutenant De Long, U. S. N., with the object of seeking an entrance to the supposed open Polar Sea by a northeast passage near Wrangel Land, passed into the Arctic Ocean on August 29th. The ship entered the ice within sight of Wrangel and Herald Islands, which ice jammed and shifted dangerously, causing the vessel to spring a leak on January 10, 1880. Caught in the pack, the vessel drifted to the northwest. Bear, seal, and walrus were shot occasionally. The ice was comparatively quiet during the summer, but in October it began to grind and pile. On May 16, 1881, land was seen to the westward. This unknown land was named *Jeannette Island*. On May 24th another island was in sight. It was called *Henrietta Island*. A party landed on this latter. It was from 2,000 to 2,500 feet high, barren and rocky, with one large and two smaller glaciers, and a covering of snow and ice on the high parts from 50 to 100 feet in thickness. Guillemots and murrelets nested in the cliffs in great numbers. The vegetation consisted only of lichens and mosses, with one species of *phanerogam*. On the 9th the ice opened and left the vessel afloat, and on the 12th it came together again and crushed her. She had been under pressure ever since she was first caught in the floe. The boats and the greater part of the stores and provisions were got out before the ship went down. There were some 24 dogs, which

could draw only the hospital-sled and a small one with extra stores. The retreat on the ice was directed toward the mouth of the Lena by way of the New Siberian or Liakhov Islands, which lay about midway in the course. The position of the *Jeannette* when she sank was about 600 miles from the Siberian coast, in a direct line. For twenty-one months the ship drifted helplessly with the pack, by the action of the winds and the currents. For the first five months after she was ice-locked off Herald Island the motion of the ice was cycloidal, the total result of the drift being only 45 miles. During the last six months the drift was very rapid to the northwestward. The soundings were 18 fathoms near Wrangel Land. The greatest depth was 80 fathoms,

LIEUTENANT GEORGE W. DE LONG.

the mean depth 35 fathoms. The *Jeannette* became imbedded in the ice immediately after entering the Arctic. No vessel could have withstood the strain to which she was constantly subjected for over eighteen months. In the latter part of the drift the sea was very shallow, 20 fathoms or under. The bottom was blue mud. Shrimps and numerous algae were brought up in the dredges. The surface temperature of the water was 20° above zero. The temperature of the air ranged from 58° below zero to 44° above. The mean temperature of the first winter was 30° below zero, of the first summer 40° above zero. Heavy gales were not frequent. The most violent showed a wind velocity of 50 miles an hour. The fluctuations of the barometer and of the thermometer were moderate. Disturbances of the needle coinciding with the auroras were observed. The winter's formation of ice was 8 feet thick. The

heaviest ice seen was 23 feet in thickness. During their retreat over the ice, a third island was seen, which was named Bennett Island. The positions of the three islands discovered were as follows: Jeannette Island, latitude  $76^{\circ} 47'$  north, longitude  $158^{\circ} 56'$  east; Henrietta Island, latitude  $77^{\circ} 8'$  north, longitude  $157^{\circ} 32'$  east; Bennett Island, latitude  $76^{\circ} 38'$  north, longitude  $148^{\circ} 20'$  east. The first was small, but the others of considerable extent. On Bennett Island, besides many birds, old deer-horns were found, and some lignite, with which Melville experimented. He found it suitable for steamers. Fossils and fine specimens of amethyst and opal were here collected by Dr. Ambler, but they were lost, as well as the

daily rations per man. There was a large quantity of alcohol, intended for fuel, and a good provision of Liebig's extract. They were well equipped with rifles and ammunition. The tents were just large enough for all to sleep in, and they were further sheltered with deerskin sleeping-bags. Some of the party were lead-poisoned from tin cans or otherwise disabled. The ice was very rough, and the floes were in motion. The men over-exerted themselves the first day, and had to rest for several days. Afterward they advanced about one mile a day. All hands were required for each sled, so that they were obliged to march thirteen miles for every mile of progress. At the end of the first week the captain found by observa-

ROUTE OF LIEUTENANT DE LONG AND THE JEANNETTE.

large collections of birds and deep-sea fauna made on the Jeannette. One result of the Jeannette Expedition is the establishment of the fact that the so-called *Polynias*, which arrested the sledge expeditions of Hedenström, Wrangel, and Anjou, are not permanent lanes produced by warm currents, but are simple openings such as have been observed in other parts of the frozen ocean.

On the 13th of June, 1881, the ship sank. Three days afterward, they started on their march southward over the ice, drawing five sleds packed with provisions, and three boats mounted on runners, a total weight of 15,400 pounds for a working force of twenty-two men. A pound of pemmican and four biscuits, with a little coffee, tea, and sugar, were the

tion that the drift of the ice to the northwest had been more rapid than their advance southward, and that they had really lost twenty-seven miles. They were in latitude  $77^{\circ} 42'$ , the highest latitude reached. They turned their course toward Bennett Island, which they sighted on July 12th, and on which they made a landing on the 27th. It was a rugged island of trap rock and a lava-like soil. It took a party two days to cross the island. The southern extremity, where they landed, was a promontory which they called Cape Emma. The tides were regular, with a rise of two or three feet. Millions of birds had their nests in the cliffs. On the eastern side were grassy valleys. They remained on Bennett Island a week. They discarded their sleds soon after leaving

the island, except the boat-sleds, which were necessary for the portages across the floes. They made sometimes ten miles a day in the boats, working between the floes, except when they had to haul their boats across. They were kept back ten days by the jamming of the ice, drifting on the pack along the north coast of Thaddens Island. They landed on the south shore of this island, which they found to be composed of mud-hills, which were wearing away rapidly, with mossy tundra in the interior. They sailed southward over the shoals between Thaddens and Kaltenoi Islands. On the latter, which is the largest of the New Siberian group, and lies northeast of the Lena mouth, they encamped on September 6th, and on Semmoffsky Island on the 10th, where they ate venison after many days of short rations. When they set out on the 12th, and were ranging along the coast, the wind blew up a gale. The first cutter, twenty feet four inches in length, and drawing twenty-eight inches, contained Captain De Long, Dr. Ambler, Mr. Collins, the meteorologist, Ninderman, Erickson, Gurtz, Noros, Dressler, Iverson, Kaach, Boyd, Machinist Lee, Ah Sam, and the Indian Alexei. The second cutter, sixteen feet three inches long, was hardly seaworthy. It contained First-Lieutenant Chipp, Ice-Pilot Dunbar, Carpenter Sweetman, Staar, Warren, Kuehne, Johnsen, and Sharwell. The whale-boat was twenty-five feet four inches long and stanchly built. Lieutenant Danenhower being disabled by ophthalmia, Engineer Melville took command. Besides these two it contained Boatswain Cole, Dr. Newcomb, the naturalist, Leach, Mansen, Wilson, Bartlett, Lauterbach, Steward, and the Indian Anequin. In the gale the boats became separated. Lieutenant Chipp's boat was lost. None of the party has been seen or heard from. The whale-boat reached one of the eastern mouths of the Lena delta on the 17th of September, 1881. The boats were within sixty miles of land when driven apart by the gale. The whale-boat sailed up the branch of the river to the Lena proper. Here three native fishermen were encountered. The Tungus took them out of the way to their village on Cape Bikoffsky. They saw there the chief and a Russian convict. These two were sent to the station of Bulun with dispatches. The Yakoot natives were not willing to guide the party to Bulun, as it was too late for navigation and too early for sledging. While they were waiting, Lieutenant Danenhower made an ineffectual search on the Lena delta for the missing boat-crews. The messenger was absent thirteen days. On his way back he fell in with two men from the cap-

tain's party who had been sent in search of assistance. Melville hastened forward to see these men, Ninderman and Noros, and to start out to find the captain and his party. After a short time he joined his party at Yakutsk, where he remained with Ninderman and Bartlett to make a thorough search in the spring, while Danenhower with the rest of the crew made his way homeward. Melville in his first search came to some of the huts where De Long had staid, and certain of the records were brought to him by natives; but he lost the track and gave up the search, being disabled from the effects of freezing in the whale-boat, and unable to induce the Tungus to carry him farther with their dog-teams; while it was already too late to succor the captain's party if they had not found other relief.

LIEUTENANT JOHN WILSON DANENHOWER, U. S. N.

While the whale-boat was driven by the gale of the night of September 12th far to the eastward, De Long sailed in a westerly direction along the shore, and made one of the western mouths of the Lena on the 16th. After trying for two days to make a landing in the boat, they left her on the shoals, and waded ashore with the arms, records, and provisions. They had only four days' rations on reduced allowance. On the 19th they set out for the south, leaving the log-books, ship's instruments, etc., at the beach. Three of the party were disabled by frost-bites, so that it took two days to march twelve miles. Here they found two huts in which they remained until the 24th, waiting for the disabled to recover from their lameness. Two reindeer were shot here. They reached another hut on the 28th, where they waited until the 1st of October for the river to freeze over. They found more game, but when they

advanced a few days farther in the tundra desert they had eaten their last meat, and prolonged their failing vitality on an allowance of three ounces of alcohol per man per day. Erickson, whose feet were frozen, died on the 7th. The captain chose Ninderman and Noros to advance by forced marches to Kumak Surka and seek succor from the natives. They set out on the 9th of October. In a starving con-

er, in which the year before he had reconnoitred a long stretch of unknown coast in Franz Josef Land, set out in June, 1881, to continue the explorations and incidentally to aid in the search for the Jeannette. As nothing was heard from Mr. Smith and his party from the time they disappeared in the north until August, 1882, they were almost given up for lost.

GEORGE M. MELVILLE, CHIEF ENGINEER, U. S. N.

dition they were found by a party of Tungus on the 19th in the huts at Bulkur, twenty-five miles north of Kumak Surka. After journeying one hundred and twenty miles without food they had only reached the locality where Captain De Long supposed, that he was when they started. The natives fed and tended the exhausted sailors, but either did not understand them or were unwilling to go with them to the relief of their shipmates. They were taken to Kumak Surka, where they saw the Russian exile who acted as Melville's messenger, and then to Bulun.

At the time when the Tungus rescued Noros and Ninderman from starvation in the huts of Bulkur, nearly all of their comrades had already breathed their last. De Long kept a journal to the last day of his life. On the 30th of October he and Dr. Ambler, with the Chinaman Ah Sam, were the only survivors, and on that day they also succumbed to their privations. In the spring Melville explored the delta thoroughly for traces of De Long's and Chipp's parties. At the end of March De Long and his eleven companions were found as corpses. They had consumed their boots and their skin-clothing to stay the pangs of hunger.

The Eira, Leigh Smith's stanch Arctic cruis-

The Eira was provisioned for a year, but not equipped for winter. The last seen of her was by a Norwegian walrus-hunter off the southwest coast of Nova Zembla. She was headed off by the ice-pack and was waiting for the ice to open. In the summer of 1882 a whaling-vessel, the Hope, was fitted out and sent in search of her, under the command of Sir Allen Young. After waiting for an opening in the ice several weeks, the Eira reached Franz Josef Land August 7th and steamed along the coast to within fifteen miles of Cape Ludlow, and then returned to Bell Island, having been headed off by the ice. Being unable to pass to the eastward of Barents Hook, they made fast to a land-floe off Cape Flora, where the vessel was nipped in the ice and sunk on August 21, 1881. A portion of the provisions were got out before she went down. Walrus and bear meat was obtained often enough to keep the officers and crew from starvation. A hut which they built of turf and stones sheltered them during the winter. On June 21, 1882, the twenty-five men started for Nova Zembla in four boats. They carried provisions which they had prepared, sufficient for two months. After sailing eighty miles, they were stopped by the ice. In six weeks water was reached again. A gale drove them on their way, and they landed at Matochin Straits within twenty-four hours. The William Barents was spoken the next morning, and from her they learned that the Hope was anchored in a neighboring bay. Sir Allen Young returned with the shipwrecked crew as soon as possible, reaching Aberdeen on the anniversary of the day when the Eira went down. In the cruise of the Eira in 1880 Leigh Smith reached Franz Josef Land at the small island called May Island to the west of Cape Tegethoff and south of Hooker Island. He passed in a southwesterly course around Barents Cape and discovered a new land which he named Northbrook Island, and its extremity Cape Flora. Beyond here he found a haven between Bell and Mabel Islands, which was named Eira Harbor. From here he passed around Cape Grant and followed the coast of the mainland as far as a point which was called Cape Neale, where he was stopped by the ice-pack. He could see from here the land for a long distance trend-

ing to the northwest. His intention the following season was to carry his explorations beyond the point reached in 1880. The ease with which the crew of the *Eira* crossed over to Nova Zembla in open boats confirms the belief held by many that in many years steamers could find a route in the autumn across the Barents Sea.

None of the Arctic voyages of 1882 was successful. The Dutch exploring vessel *William Barents* was unable to enter Kara Sea on account of the ice. Sir G. Gore-Booth was not more fortunate in the Kara. Trading-vessels bound for the Yenisei were obliged to turn back. Captain Hovgaard, who was bound for Cape Tcheliusk, in the *Dymphna*, was ice-bound near Waigat Island. The *Varna*, while carrying a party of Dutch meteorologists to establish an international station at Dickson's Harbor on the Yenisei, was caught in the pack in the same place.

Captain Weyprecht's scheme of establishing permanent meteorological stations for taking simultaneous observations of atmospheric and magnetic phenomena at many different points around the pole has been carried out at last. There are about 200 observers, sent by the leading governments of the world, in 15 principal and 24 subsidiary stations, who will continue their observations until the end of August, 1883. Upon their return they will all meet in London to compare their records and exchange views. The 15 main stations are as follow: two Russian, one on the Lena delta and one at Karmankuli Bay, in Nova Zembla; one Dutch, at Dickson Harbor; two Norwegian, one at Sodan Kylar, in Finland, and one at Bossekop, in Lapland; one Austrian, on Jan Mayen; one Swedish, at Cape Thorsden, in Spitzbergen; one Danish, at Godthaab, in Greenland; one German, at Cumberland Sound; two American, one in Lady Franklin Bay and one at Point Barrow; one British and Canadian, on the Great Slave Lake; one French, at Cape Horn; one German, in South Georgia; and one Italian, at Villa Colon, near Montevideo. The establishment of the two latter is the commencement of investigations around the south pole.

The German international meteorological station at Cumberland Sound was established in August, at Kingawa Fjord, in  $66^{\circ} 37'$  north latitude, and  $87^{\circ} 15'$  west longitude. The observers remain one year. They encountered an unusual amount of ice in Davis Straits and made their way through the sound with difficulty. The British charts were found to be worthless, nearly all the positions being wrong, the latitudes nearly a degree out of the way. Dr. Wilhelm Giese, of the Berlin Observatory, is the chief, with Dr. Leopold Ambrun as assistant meteorologist; two physicians conduct naturalistic researches. The Austrian international expedition to Jan Mayen, recruited from the navy, and commanded by Lieutenant Wohlgemuth, was unable to approach the island at

the end of May; but, returning in June, they reached Jan Mayen on the north side, and, after being retarded a fortnight by the shore-ice, anchored in Mary Muss Bay, and landed in the middle of July. The observatory was erected in  $71^{\circ}$  north latitude, and  $8^{\circ} 26'$  west longitude. Exploring the Beerenberg volcano to the edge of the crater, 5,000 feet above the sea, they perceived subterranean rumblings and saw sulphurous smoke issuing from crevices in the sides of the mountain.

ASIA.—The Russian commission which has been studying the problem of turning the Amu Darya into its old channel and making it flow into the Caspian instead of the Sea of Aral, have given up the task in despair. There is no doubt that the Uzboi was the ancient channel of the Oxus; but to deflect the river into its old bed would be to turn it into the old lake-basin of Sara Kamysh, which is greater in extent than the Aral Sea, and where the evaporation is so great that the Oxus could never fill it again. The Russian engineer Lessar asserts that there exist other lake-basins of the same kind, and that Serakhs and other places, visited by him in 1881-'82, lie considerably below the level of the Caspian Sea.

AFRICA.—The French have displayed a feverish activity in Africa, as well as in Asia and other fields, for trade and colonization. One of the schemes which they have pursued with the greatest eagerness has been the commercial development of their possessions in Senegambia and the extension of French influence and commerce in the interior. The trans-Sahara Railway, with which it was expected to tap Timbuctoo and the Soodan, has been given up, and the scheme of conducting the Mediterranean waters through an artificial channel into the salt basins of Algeria has been abandoned. The only scheme which rivals the Senegambian project is De Brazza's for tapping the trade of equatorial Africa. In Northwest Africa, as everywhere, the French have rivals in the English, in whose colony at the mouth of the Senegal is the natural outlet for the trade of the interior. France has been strengthening her political position in these regions for several years. In 1881 Captain Gallieni induced King Ahmadu, of Sego, on the Niger, to place himself under French protection. Kita, a place which lies half-way between the Niger and the Senegal, has been occupied by the French military. An expedition set out late in 1882, under Colonel Borgnis-Desbordes, to construct a fort at Bamaku, and launch a fleet of steamboats on the Niger. Another expedition, of engineers and workmen, departed to build a railway between the Niger and the head of navigation on the Senegal.

The emulation of explorers in equatorial Africa has given place to the bitter feelings of national and commercial rivalry since the resources of the vast elevated interior have become known. The two distinguished explorers, Stanley and De Brazza, have both devoted

their energies to establishing a commercial route from the coast into the productive and healthful interior. Stanley was first in the field. With abundant means furnished by the King of the Belgians, he, at great cost and with great difficulty, constructed a road, fifteen feet wide and solidly laid to withstand the torrents which descend the mountain-sides in the rainy season, from below the cataracts along the north bank of the river to the upper navigable waters above Stanley Pool. The length of this costly artificial route is 230 miles. He commenced the work in August, 1879, with a force of fifteen Europeans, sixty-eight Zanzibaris, and a number of Kabindas, besides the natives whom he engaged in the districts through which the road passed. The engineering tools and machinery were brought from Europe in an English steamer and a barge towed by their own steamer, *La Belgique*, of thirty tons burden. They were provided besides with four steam-launches and five other launches. Stanley gave substantial consideration to the five chiefs of Vivi for the right to build the road through their territories. He leveled the summit of a rocky hill upon which to erect the first station. By December, 1880, the turnpike and bridges had been built as far as the second station, at Isangila, fifty-two miles from Vivi. Beyond was a mountain around which the road had to be carried by excavations and stone embankments. Beyond the mountain the road leads through a dense forest, in which the tall trees which they felled were piled on each side, and the roots dug out with much labor. The third station, Manyanga, was reached in May, 1881. The river is navigable between the two stations. Stanley fell ill at this stage of the work. When recovered he pushed forward to select a site for the fourth station on Stanley Pool. He had been obliged to pay a dear price for every privilege, and was prepared to offer high ground-rent for the site, but here he encountered unexpected difficulties. De Brazza had preceded him and bespoken the spot which he chose for the fourth station on the north bank of the river. It came almost to a bloody conflict between Stanley and the people at Mfiva, where De Brazza had acquired a cession of land on which to found the future French station of Brazzaville. A friendly chief intervened and offered Stanley another site on the opposite shore, where he erected the station of Leopoldville. In December, 1881, he launched a steam-yacht and boat on the Congo above the last of the Livingstone Falls. The site for a fifth station was selected at the confluence of the Coango with the Congo, about one hundred miles above Leopoldville. The soil is reported by Stanley to be of inexhaustible fertility and suited to all kinds of crops. The supply of caoutchouc in the forests is sufficient for the world's demand. The principal difficulty in the utilization of the river throughout its navigable length he considers to be the cannibal tribes beyond the farthest point

reached, and Nyanginé, with whom he had many collisions in his original exploration of the Congo. Before returning to Europe, Stanley made a voyage of discovery in the steam-launch for four hundred miles above Stanley Pool. He steamed up a new river, entering the Congo from the south some distance above Stanley Pool. It led into a fine lake, which was covered with fishing-canoes.

French explorers have usually chosen the Ogové River as the route of their expeditions in Central Africa. Its delta is only forty miles south from the Gaboon, on which there is a French colony. One of the more energetic and successful of the explorers of the Ogové is Savorgnan de Brazza, an Italian, who holds a commission in the French Navy. In 1880 he discovered that a tributary of the Congo, the Alima, rises close to the upper course of the Ogové. He descended the Alima to the Congo. Between the navigable waters of the Ogové and of the Alima there are passable natural roads, and a railroad could be built over the short stretch at less expense than Stanley's wagon-road around the cataracts of the Congo. He unfolded a remarkable skill in African diplomacy in his efforts to forestall Stanley and obtain for his country a priority in the commerce of the Congo. On the upper Ogové he established a French station, Franceville. On the Congo he obtained the cession of a strip of territory fronting for nine miles on the Congo at Stanley Pool. A treaty was drawn and signed by the immediate chief of the territory and by all the chiefs of the Batekes and their head chief Makoko, who claims the sovereignty of all the region between the Lefini, or Lawson, and the Ncouna Rivers. They agreed to the grant, and accepted French flags in token of the protection of the French Republic, according to De Brazza's construction of the arrangement. The documents were signed on September 10 and October 3, 1880. De Brazza then descended the Congo to where Stanley was engaged in his toilsome task near the second station, at Isangila. In a second journey, concluded in the summer of 1882, De Brazza explored the country north and south of Franceville, seeking some more favorable water-route by which the commerce of the Congo could be diverted. He explored the plateau between the source of the Ogové and the coast. He found it to be extremely fertile, and rich in copper and lead. He found also another promising water-route, the Niari River, which discharges only sixty miles north of the mouth of the Congo. The chiefs between the Ogové and the Congo seem to look favorably thus far on the development of a French protectorate. The rough methods of Stanley are the cause of his being more feared than liked in the region of the Congo. Since the return of De Brazza, Dr. Ballay has departed for the upper Ogové. Mizon, the head of the station at Franceville, has explored the plateau between the Alima and the Ogové several

times, examining all the water-courses with a view to the discovery of navigable ways, and cementing the good understanding with the natives. The French Government felt at first a cautious reluctance to embrace De Brazza's scheme for the establishment of French primacy on the Congo, but on the 30th of November, 1882, pursuant to a law of the Chambers, the treaty with Makoko and his vassal chiefs was ratified. The Portuguese, who claim the sovereignty over the mouth of the Congo and the interior, raised a protest, although their rights in this region are merely nominal. De Brazza and his coadjutors look to the extension of French dominion from the Gaboon over the valley of the Ogové and thence to the middle course of the Congo.

AMERICA.—The researches of Charnay in Central America prove that the Toltecs and Mayas stood in a high stage of civilization at the period immediately preceding the coming of the Spaniards, but that this civilization was then of very recent development. The ruins of a large city, probably that referred to by Stephens as the "Phantom City," were discovered in Guatemala on the Usumacinta. The city to which Charnay gave the name of Lorrillard City consists of a multitude of palaces, temples, and houses which resemble those of Palenque, which it resembles also in being built upon terraces cut out of natural hills. The hieroglyphics are as elaborate as those of Palenque and Comalcalco, and the bas-reliefs even finer. The houses are of varying and irregular construction, as at Palenque. The great temple stands on the summit of a pyramid 120 feet high. The frieze is ornamented with human figures. On the decorative coping once stood a colossal statue. Beside the temple is a large palace, and behind it a great pyramid on which stood six palaces.

GEORGIA. Governor, Alexander Hamilton Stephens; Secretary of State, N. C. Barnett; Treasurer, D. N. Speer; Comptroller-General, W. A. Wright; State School Commissioner, G. J. Orr; Attorney-General, Clifford Anderson; Commissioner of Agriculture, J. T. Henderson; Railroad Commissioners, James M. Smith, Campbell Wallace, L. N. Trammell; Principal Keeper of the Penitentiary, J. W. Nelms. United States Senators, Hon. Joseph E. Brown, Hon. Pope Barrow (till March 4, 1883), Hon. Alfred Holt Colquitt (after March 4th). Members of Congress, J. O. Nichols, First District; H. G. Turner, Second District; Charles F. Crisp, Third District; Hugh Buchanan, Fourth District; N. J. Hammond, Fifth District; James H. Blount, Sixth District; J. O. Clements, Seventh District; Seaborn Reese, Eighth District; Allen D. Candler, Ninth District; Thomas Hardeman, at large.

FINANCIAL STATEMENT.—The report of the Treasurer for the fiscal year from October 1, 1881, to September 30, 1882, shows that the total amount received in the Treasury for the above period was \$2,403,976.61, and that the

disbursements were \$1,713,507.48, leaving a balance in the Treasury, October 1, 1882, of \$690,472.15, in which are included \$275,000 in bonds of the State of Georgia (\$115,000) and in United States registered bonds (\$160,000) paid by the purchasers of the Macon and Brunswick Railroad, and the suspended balances due from the Citizens' Bank of Atlanta (\$83,218.51) and from the Bank of Rome (\$22,206.42). Deducting this unavailable amount, \$380,424.74, from the stated balance of \$690,472.15, and the actual cash balance on October 1, 1882, is \$310,047.41. The public debt of the State is \$9,624,135, the annual interest on which amounts to \$645,440. Of this debt, \$100,000 mature in 1883; \$100,000 in 1884; \$175,635 in 1885; \$4,000,000 in 1886; \$2,098,000 in 1890; \$307,500 in 1892; \$542,000 in 1896; \$2,298,000 in 1898; and \$3,000 in 1932. The greater portion of this sum bears seven per cent interest. In addition to this bonded debt, the State is liable absolutely and contingently as indorser on bonds of the South Georgia and Florida Railroad amounting to \$464,000, and on bonds of the Northeastern Railroad amounting to \$260,000.

The property owned and possessed by the State consists of the Western and Atlantic Railroad, 138 miles, leased at an annual rental of \$300,000, the lease having nine years to run; Macon and Brunswick Railroad, 195 miles, sold for \$1,125,000, of which \$625,000 are yet due; bonds of the Marietta and North Georgia Railroad, \$66,233.62; 186 shares of the Georgia Railroad and Banking Company, \$25,000; and 440 shares of the Southern and Atlantic Telegraph, guaranteed by the Western Union Telegraph Company, \$10,000. The value of the public buildings owned by the State is not estimated. The estimated receipts at the Treasury for the year ending December 31, 1883, is \$1,350,000, and the estimated disbursements for the same period \$1,361,317.14. No State in the Union is in a sounder financial condition, or has a higher standing in the money markets of the world. In 1877 the public debt was \$11,044,000, with an annual interest of \$800,000. In 1876 the State had a floating debt of \$256,000, all of which has been extinguished. For several years the State has not borrowed a dollar to meet the expenses of her government, but, on the contrary, she has been able to pay off nearly \$1,500,000 of her debt, and reduce her annual interest account \$150,000. In addition to this, she has covered in the Treasury nearly \$250,000 from the collection of outstanding debts long due to her. At the close of 1881 the market for Georgia stocks and bonds was brisk at very high figures, from seven to ten points above the previous year. But, mainly owing to the short cotton crop, the year 1882 closed with lower prices. The following quotations of South Georgia, city of Savannah, and some railroad mortgage bonds and stocks, will illustrate the decline:

STOCKS AND BONDS.	1881.		1882.	
	Bid.	Asked.	Bid.	Asked.
South Georgia 6 per cent bonds, due 1889.....	111½	112	106	107
South Georgia 7 per cent bonds, maturing 1886.....	111	111½	105	106
South Georgia 7 per cent bonds, due 1896.....	124	125	122	123
City of Savannah 5 per cent bonds.....	88	88½	88½	84½
Central Railroad 7 per cent mortgage bonds.....	119	120	111½	112½
Georgia Railroad 6 per cent bonds.....	107½	108½	105	106
Montgomery and Eufaula Railroad 6 per cent indorsed bonds.....	107	108	104	105
Western Railroad 5 per cent second-mortgage indorsed bonds.....	120	121	118	118½
Georgia Railroad stocks.....	174	175	155	157
Central Railroad stocks.....	122½	123	97½	98½
Augusta and Savannah stocks.....	123	124	118	119
Southwestern Railroad stocks.....	121	123	116	117

The above prices are not nominal, as buyers are more eager to purchase than holders to sell at these figures.

PROPERTY, TAXATION, ETC.—The report of the Comptroller-General presents a very encouraging exhibit of the material condition of the State. The property of Georgia, as returned for taxation for the year 1882, shows an increase of \$16,255,150; the whole amount of taxable property being returned at \$287,249,403. The increase for 1881 was \$18,977,-

611, making the total growth of wealth for the two years \$35,232,761, yielding, at the existing rate of taxation (three mills on the dollar), additional revenue to the amount of \$105,698.

The following table shows in a consolidated form the aggregate value of the whole property in Georgia returned for taxation for the years 1881 and 1882; showing the increase and decrease in values of each kind of property, and the total increase for 1882:

DESCRIPTION OF PROPERTY.	Value, 1881.	Value, 1882.	Increase.	Decrease.
Improved lands.....	\$90,597,519	\$94,462,914	\$3,865,395	.....
Wild lands.....	1,886,915	2,373,827	586,912	.....
City and town property.....	55,622,501	60,458,957	4,831,156	.....
Building and loan associations (capital).....	256,110	308,496	52,386	.....
Bank-shares (value).....	4,518,637	9,399,086	.....	\$479,551
Money and solvent debts.....	32,043,086	33,608,058	1,564,972	.....
Merchandise.....	15,662,547	16,091,125	428,578	.....
Capital in shipping.....	201,199	172,201	.....	28,998
Stocks and bonds (value).....	5,287,021	6,262,405	965,384	.....
Cotton-factories.....	2,482,086	3,543,881	1,061,795	.....
Iron-works.....	649,949	569,231	.....	219,282
Capital in mining.....	101,675	127,622	25,947	.....
Household furniture.....	9,988,209	10,157,645	174,436	.....
Watches, jewelry, plate.....	1,168,469	1,188,327	19,858	.....
Horses, mules, hogs, etc.....	23,638,294	23,514,937	.....	123,357
Plantation-tools, etc.....	8,474,208	8,577,632	103,420	.....
Cotton, corn, etc., April 1st.....	980,180	846,313	.....	\$13,867
Other property.....	5,107,859	5,940,759	832,900	.....
Defaulters' property (single).....	995,811	1,396,500	400,629	.....
Railroad property.....	16,741,258	18,729,427	1,988,169	.....
Totals.....	\$270,993,888	\$287,249,403	\$17,071,285	\$16,255,150
Total value of property, 1882.....				\$287,249,403
Total value of property, 1881.....				270,993,888
Increase in value for 1882.....				\$16,255,150

The number of polls returned by colored taxpayers for 1882 is 93,635, owning property, real and personal, of the aggregate value of

\$6,589,876. The relative wealth, real and personal, of the five most populous counties in the State is shown as follows:

COUNTIES.	Value, 1882.	Value, 1881.	Increase.	Decrease.
Fulton.....	\$24,592,287	\$22,989,750	\$1,652,507	.....
Chatham.....	20,961,788	17,580,590	2,781,198	.....
Richmond.....	17,989,050	16,604,091	1,384,959	.....
Bibb.....	9,554,007	9,043,313	510,694	.....
Muscogee.....	8,705,054	8,108,719	596,335	.....

The amount of fire insurance for the year ending April 30, 1882, was \$118,048,367.05, the premiums on which amounted to \$1,107,363.34, an average rate of less than one per cent. The losses amounted to \$991,329.86. The amount of life insurance for the same period was \$6,677,454, the premiums on which amounted to \$183,277.75. The losses were \$119,734.52.

The report of the Comptroller-General, as to

the increase of revenue and its assured permanence, induced the General Assembly, at its session in November and December, to reduce the rate of taxation from three to two and a half mills.

The decrease in the State tax during the past six years affords gratifying evidence of the growing prosperity of the Commonwealth. In that time the tax was reduced first from six mills

to five, then from five to three, and now from three to two and a half. This is the result of a steady increase in the value of property, and of a steady decrease in the expenditures and in the rate of interest. Ten years ago the State paid ten per cent; now she can easily float a loan, should she need it, at five per cent.

The purposes of the estimated disbursements for the ensuing year are as follows:

On account of civil establishment.....	\$87,050 00
contingent fund.....	10,000 00
printing fund.....	10,000 00
Academy for the Blind.....	12,000 00
Deaf and Dumb Asylum.....	15,000 00
Lunatic Asylum.....	100,000 00
University of Georgia.....	5,000 00
Atlanta University (colored).....	8,000 00
Department of Agriculture.....	10,000 00
public debt.....	745,440 00
expenses of Penitentiary.....	6,700 00
State chemist.....	3,000 00
inspectors of fertilizers.....	6,000 00
Railroad Commission.....	8,700 00
trustees of Asylum.....	1,500 00
salary school fund.....	270,000 00
land-scrip fund.....	6,314 14
Legislative pay-roll.....	42,618 00
Total.....	\$1,861,817 14

STATE INSTITUTIONS.—The University of Georgia, at Athens, Clarke County, including the State College of Agriculture and the Mechanic Arts, the Medical College at Augusta, and the branch preparatory colleges at Dahlonega, Milledgeville, Cuthbert, and Thomasville, shows a marked improvement as compared with previous years. The total number of students for the collegiate year ending July 19, 1882, was 1,108. In the current collegiate year this number will be largely increased; that already in attendance at Athens being one third larger than in the past year. The departments of the university are: 1. The Academic Department, known as Franklin College. 2. The State College Department—the State College of Agriculture and the Mechanic Arts. 3. The Law Department. 4. The Medical Department. The faculty of Franklin College consists of nine professors; that of the State College of Agriculture, etc., of eight professors; that of the Law Department, of six professors and lecturers; and that of the Medical Department, of eleven professors and demonstrators, with eleven clinical assistants. The university degrees are: 1. Master of Arts. 2. Civil Engineer. 3. Bachelor of law. 4. Doctor of Medicine. The Franklin College confers the degrees of Bachelor of Arts, Bachelor of Science, and Bachelor of Philosophy; and the State College of Agriculture, etc., confers the degrees of Bachelor of Agriculture, Bachelor of Chemical Science, and Bachelor of Engineering. The standard of scholarship for each degree is as high as that of any other university in the Union. By the action of the Board of Trustees two years ago, tuition was made free in Franklin College and in the State College of Agriculture. The chemical, physical, engineering, and agricultural apparatus is complete and of the newest make. The income of the university for the past year was \$49,213.30, and the expenditures were \$40,-

510.67. At the last commencement, July, 1882, Senator Joseph E. Brown, one of the trustees, proposed to donate to the university \$50,000, on condition that the State receive the sum in cash into the Treasury to be used in payment of the public debt, or in such other manner as may be for the best interests of the State, and will issue her bond or bonds to the university bearing seven per cent interest, payable semi-annually, the bonds to run for fifty years. The object of the donation was to establish a fund in the hands of the university, the interest of which (\$3,500) was to be loaned to young men of good character in Georgia, who desire to obtain a liberal education, but who lack, wholly or in part, the means necessary to pay for their board and clothing while engaged in the pursuit of their studies at the university. It was further conditioned that no young man should avail himself of the benefit of the fund until he was eighteen years of age; that each sign a pledge of honor, when he enters college, to refund the sum received as soon as he can do so after he completes his course of study; that he shall pledge himself that when twenty-one years of age he will give the university his legal obligation for the payment of the sum with four per cent per annum interest; and that not more than \$200 per annum shall be loaned to any student, to be advanced to him monthly during the scholastic year. It was also provided that, in case of a large number of applicants, the trustees should select the beneficiaries by competitive examination or otherwise; that the sums repaid by each student be added annually to the principal, and only the interest loaned in future, so as to increase the number of beneficiaries, and also to increase the principal sum, which in progress of time would grow to a large amount; that if in any year there should not be a sufficient number of applicants of good moral character and promise to consume the amount of interest accruing during the year, the unused interest should be added to the principal; and that young men studying for the ministry should only be required to refund half the amount borrowed. The fund was to be called the "Charles McDonald Brown Scholarship Fund," in memory of Senator Brown's son, Charles McDonald Brown, a noble Christian youth of fine intellect and high honor and integrity, who had been a student in the university, and died in the year 1881. The trustees gratefully accepted the donation on the proposed conditions, but the General Assembly refused to comply with the terms specified, on the ground that the State Constitution forbids any increase of the public debt of the State, except to repel invasion and to defend the State in time of war, and that the issue of the bonds would be a direct violation of the Constitution. Some of the ablest lawyers in the State hold a contrary opinion, but the legislative action deprives the poor and meritorious young men who desire to obtain a liberal education, but can not

do so from want of the necessary means, of a munificent provision for their benefit, unless Senator Brown thinks proper hereafter to modify the terms of his gift.

It is proposed, if the Legislature will vote the necessary means, to provide the technological department of the university which now gives instruction in the four practical arts of physics, chemistry, agriculture, and engineering, with a well-equipped workshop in which the object and use of tools in every kind of manufacture may be taught. Such an industrial school as is proposed, in connection with the educational advantages of the university, would be of great value to the number of young men whose necessities demand that their education shall be practical.

**THE LUNATIC ASYLUM.**—The reports of the trustees and superintendent of this institution represent considerable improvement in its management and administration, especially in the attention given to the mental and moral treatment of the patients. The number of these in the asylum on October 1, 1882 (the date of the latest report), is 979, against 906 the year before. Of these, 729 are white and 250 colored. The total number under treatment during the year has been 1,163. The trustees ask an appropriation for 1883 of \$160,000 to cover all expenses, calculating the maintenance of each patient per day at 35 cents, and including the repairs and improvements of the buildings. Several new buildings have been commenced during the year to provide adequate accommodation for the rapidly increasing number of lunatics and idiots, white and colored, among which is one new building of 500 rooms for the colored patients, which will be completed early in the spring of 1883. The cost of these additions, furniture, etc., will be \$89,254.82, making a total appropriation for 1883 of \$249,254.82.

**THE DEAF AND DUMB ASYLUM.**—The twenty-second report of the Trustees of the Institution for the Education of the Deaf and Dumb makes a satisfactory exhibit of its management. During fifteen months, to October, 1881, there were 64 pupils, all white, of whom 37 were males and 27 females. In the following year to October, 1882, there were 60 white pupils—males 35, females 25, and 20 colored pupils—males 12, females 8. The amount expended for the year 1881 was \$17,376.33, and for 1882, \$14,773.68. An appropriation of \$5,000 was made by the Legislature in 1881 for the erection of a school-building, but the trustees did not use it, because of its insufficiency to provide such a building as is needed. They have, therefore, asked an additional appropriation of \$15,000, and further sums of \$3,000 for a laundry, and \$1,500 for repairs and water-works. The estimated annual expenses of the institution are \$20,000.

**THE ACADEMY FOR THE BLIND.**—This institution, established at Macon for the education of the young blind of the State, so as to enable

them to sustain themselves in after-years by their own industry, has had 66 pupils in attendance during the past year, being a few more than the highest number in any former year. The total expenses of the academy for the year have been \$10,945.81, making the *per capita* expense of the pupils \$165.84. The cost *per capita* at the Perkins Institution for the Blind at Boston, Mass., is reported to be \$422.25. The academy is situated in a healthy locality, is spacious, well ventilated and drained, and well furnished with all the special appliances that are needed for the safety, comfort, and education of the pupils. The education is literary, musical, and industrial, and the results are exceedingly gratifying. A separate department, for the instruction and care of blind colored boys and girls, has been recently organized and opened under authority of the Legislature, at an annual expense of \$4,000. A good, substantial brick building has been erected for this purpose on grounds three and a half acres in extent. The management, modes of instruction, discipline, and all other regulations, are the same as those followed in the department for the white pupils. The annual appropriation for the white department is \$12,000; for the colored, \$4,000, in addition to which, for finishing the building for the colored, improvements, repairs, etc., an appropriation of \$9,000 is asked. The principal of both institutions is Professor W. D. Williams, who has been the manager of the academy for upward of a quarter of a century.

**THE PENITENTIARY.**—The policy, wisdom, and humanity of the treatment of convicted criminals, under the existing punitive system, established by law in 1866, have been widely questioned. Instead of being confined in prisons at an immense cost to the State, the convicts are now "farmed out" on the best and most advantageous terms that the Governor can make. This mode of dealing with them was inaugurated (May 11, 1868) by General Ruger, at that time Military Governor of Georgia. It was continued by Governor Rufus B. Bullock; and the present lease, which will not expire until 1899, was executed by Governor James M. Smith, under the authority and by direction of an act of the Legislature. Under the provisions of that act, the convicts in control of the several lessees are kept and disciplined according to strict and humane rules provided by law. For instance: no one is allowed to whip or punish a convict unless authorized to do so by special appointment approved by the Governor. A violation of this rule subjects the offender to imprisonment in the Penitentiary for not less than six months and not exceeding two years. At the expiration of a convict's term of service, his lessee is compelled to provide him with transportation to his home and a suit of clothes worth not less than six dollars. It is made the duty of the grand juries of the counties in which the convict-camps are situated, to visit and inspect

them, see that the prisoners are properly fed, clothed, and housed, and that they are not inhumanly worked or otherwise ill-treated. Adequate provision is made for the medical treatment of the sick, and it is the duty of the assistant keeper of the Penitentiary to visit each camp every month and make a detailed report, under oath, as to its condition. The average number of convicts thus leased is twelve hundred, eight tenths of whom are negroes. The death-rate is rather under 1 per cent; of reconvicted criminals the rate is about 4 per cent. In two years only twenty-six have escaped. Their diet for the daily ration consists of  $\frac{3}{4}$  pound of bacon, two pounds of bread, one pint of sirup, with vegetables in their season, and peas, turnips, and potatoes in winter, and beef and mutton when procurable instead of bacon. Their clothing consists of four suits of clothes—two summer and two winter—two pairs of shoes, and a hat or cap. They are compelled to bathe and change their under-clothing once a week. The bedding is a cotton mattress, with sufficient blankets. The buildings in which they are sheltered are as good as the ordinary cabins on plantations. On October 20, 1882, the number of convicts was 1,243; of these, 112 are white males, 1 white female, 1,100 colored males, and 30 colored females. The oldest convict is seventy-eight and the youngest twelve years. The annual income derived by the State from the lease of the convicts is \$25,000. Out of this sum are paid the salaries of the principal and assistant keepers of the Penitentiary, and of the physician, and the traveling expenses for the monthly inspection of the camps. The principal keeper recommends the expenditure of the entire rental for the religious and moral instruction of the convicts.

DEPARTMENT OF AGRICULTURE, ETC.—This branch of the State government consists of a Commissioner, assistant, three clerks, a chemist, two Inspectors of Fertilizers at Augusta, one at Atlanta, one at Columbus, one at Macon, and one at Brunswick, and one Superintendent of Fisheries. Since its organization, and the establishment of the State College of Agriculture, farming has received a surprising impetus. The light of science and experiment has been shed upon the vital subject of soil-production, and the result has been an advance which the farmers of twenty-five years ago would have deemed impossible. In the increased use and demand for improved farm implements; in the more systematic and economical management of the farms; in the more thorough preparation of the soil, and in the cultivation and harvesting of crops; and in the largely increased acreable production, this advance within the past few years is as great as it is encouraging. The present system of inspection and analysis of commercial fertilizers has been of incalculable benefit in the protection it gives the farmer against the purchase of fraudulent and worthless com-

pounds. During the season of 1880-'81 there were inspected 152,404 tons of fertilizers; and during the season of 1881-'82, 125,427 tons, a decrease of 26,977 tons, mainly attributable to the more intelligent and economical use of cotton-seed, and of the other manurial resources of the farm, and also to a closer study and practice of the *art* of agriculture, so long beneficially practiced in other countries. During the year 1880-'81, the net receipts in the State Treasury from the fees for the inspection of fertilizers, after deducting all the expenses, were \$64,060.23; and for the year 1881-'82, \$50,251.32. The average of ammoniated fertilizers for 1881-'82 was: Available phosphoric acid, 10.20; ammonia, 2.48; potash, 1.58; and the average of non-ammoniated fertilizers was: Available phosphoric acid, 12.48; and potash, 1.05. Previous to 1877, when the present system was established, the fees arising from the inspection were the perquisites of the inspectors; now the inspectors are paid a fixed salary of \$1,200. One of the most noteworthy facts in the recent improvements in economical agriculture is the development of the value of cotton-seed. Its chief value as a fertilizer is the large percentage of the nitrogen it contains. This is all retained by the system of composting with stable-manure and acid phosphate; the latter, from the large percentage it contains of sulphate of lime, preventing the escape of the ammonia evolved in decomposition. It is estimated that the cotton-crop of Georgia, raised on 2,617,188 acres, amounts to 814,441 bales, yielding, at 900 pounds per bale, 366,498 tons of cotton-seed. Deducting from this amount 78,464 for planting, 288,034 tons remain for use as manure or for stock-food. These, at \$10 per ton, are worth \$2,880,340. The oil which could be extracted from this number of tons of seed would sell for \$3,528,416; the lint which remains on the seed is worth \$443,572; the oil-cake, or meal, is worth \$2,016,240, and the ash of the hulls, \$60,480, making a total value of the whole surplus crop of seed produced in the State, after reserving a liberal quantity for planting, \$6,048,888, showing the increase in value of the manipulated as compared with the green seed to be \$3,168,548. Farmers who sell their seed to the oil-mills at \$10 per ton are thus losing annually over \$3,000,000. An effort is being made to induce the Legislature to appropriate sufficient money to equip and operate one or more experimental stations in the State, to conduct experiments in fertilization, culture, stock-breeding, stock-feeding, improvement of seeds, tests of machinery, and particularly to carry on purely scientific investigations bearing upon practical agriculture. The State Agricultural Society has a large membership which represents the county societies. It meets in February and August every year, and exercises a great influence in the promotion of agricultural reforms and in the diffusion of valuable information.

The general condition of the farmers throughout the State is said to be prosperous. The abandonment of the "all-cotton" policy, and greater attention to grain-crops and home supplies, make them bear more complacently the low price of cotton.

The Commissioner of Agriculture estimates the corn-crop of the State at 36,963,940 bushels, the wheat-crop at 3,284,960, and the oat-crop at 11,643,482.

The estimated indebtedness of farmers in the whole State is 76 per cent of that of last year. According to this estimate the farmers of the State have reduced their indebtedness since last year 24 per cent.

A majority of the correspondents in every section report an advance in farm-lands since December, 1881, as follows: In North Georgia, 13 per cent; in Middle Georgia, 11.5 per cent; in Southwest Georgia, 20 per cent; in East Georgia, 15 per cent; and in Southeast Georgia, 40 per cent. The average advance in the whole State is 14 per cent.

**THE RAILROAD COMMISSION AND THE RAILROADS.**—When the Constitution of 1877 conferred the power on the General Assembly "to regulate railroad freight and passenger tariffs, preventing unjust discriminations and requiring reasonable and just rates," etc., and when subsequently, in the exercise of this authority, the General Assembly created a Board of Railroad Commissioners, compelling the various railroad companies in Georgia, under heavy penalties, to accept and obey its orders as to charges for freight and passengers, it was thought that the opposition to the commission would be violent and uncompromising, especially on the part of those roads with whose chartered or "vested" rights the commission might seem to interfere. Public opinion has so decidedly approved the legislation as a protection against monopolies, and experience has so fully demonstrated its utility as well as its impartiality, that the railroad companies have generally acquiesced and conformed to its regulations, while protesting feebly in order, as they allege, not to surrender their chartered privileges. The Georgia Railroad, from Atlanta to Augusta, 171 miles, nominally leased in May, 1881, to the late William M. Wadley, President of the Central Railroad, from Savannah *via* Macon to Atlanta, but really, as is universally understood and believed, to the Central Railroad Company, has taken exception to some freight regulations of the commissioners issued in February, 1882, and applied to the Superior Court of Fulton County for an injunction restraining the commissioners from prescribing rates of freight over the Georgia Railroad, alleging that the act creating the commission is unconstitutional, and that consequently all its acts are null and void, and praying the court to so declare. The Superior Court having refused the injunction, though suspending the enforcement of the commission's order until the case shall be finally adjudicated, appeal

has been taken to the Supreme Court of the State, where it is now pending. It will be heard in the spring of 1883, and deep interest is felt in the decision. The commission's circular, No. 20, to which the Georgia Railroad so strenuously objected, and which caused the present controversy, is thus fully and clearly explained and justified by the commissioners in their answer to the complainant's bill:

A Cincinnati or Louisville miller can ship a barrel of 200 pounds of flour from his place to Charleston, S. C., directly through Atlanta—a distance of 783 miles—for 30 cents per barrel. If an Atlanta miller shipped 300 pounds of wheat from Cincinnati or Louisville he paid therefor 93 cents freight to Atlanta—a distance of 474 miles. After grinding it into flour he then paid 60 cents per 100 pounds or \$1.20 per barrel of 200 pounds of flour freight from Atlanta to Charleston—a distance of 309 miles—making \$2.13 per barrel freight that the Georgia miller really paid on a barrel of flour ground in this State as against 30 cents that the Cincinnati and Louisville miller paid freight on a barrel of flour ground there and transported over identically the same roads and the same distance, being a discrimination of \$1.83 per barrel against the Georgia miller in favor of the Western miller, and against the farmer of our State in favor of the Western farmer. . . . Out of a rate from Cincinnati or Louisville to Charleston, S. C., the Georgia Railroad for hauling 171 miles voluntarily accepted six and one fifth cents as tolls on a barrel of flour; but the proportion of the rate on a barrel of flour shipped by a Georgia miller from Atlanta to Charleston, which that road transported 171 miles, was about thirty-two cents. That is, over five times as great a rate was collected by the Georgia Railroad on a Georgia miller's barrel of flour shipped to Charleston, S. C., as was voluntarily accepted by that road on a barrel of flour shipped by a Cincinnati or Louisville miller the same distance over its road. And in addition the Georgia miller was required to ship as much as a car-load of flour to get the benefit of even this rate, while the Cincinnati miller was permitted to ship any quantity, from one barrel up, at the greatly discriminating rates mentioned, granted him by the railroads.

The question involved is of deep interest, not only to citizens of Georgia, but to the people of every State.

The aggregate value of the taxable property of railroads in Georgia, as returned by their authorized agents for the year 1882, is \$18,729,429. Their business during the year, notwithstanding the reduction of their rates of freight and passenger fares by the Railroad Commission, and the increased and increasing competition, has been satisfactory. The roads generally are in good order; steel rails are being rapidly substituted for iron; their equipment has been much improved, and faster schedules as to running time between termini are being adopted; 325 miles of new railroad have been constructed during the year, and a number of new roads, of both broad and narrow gauge, are projected, but it is by no means certain that they will be completed within a short time.

An important decision as to the rights of railroad corporations was pronounced by the Supreme Court of Georgia in December, in the case of *Chambers vs. the Cincinnati and Georgia Railroad Company*. The road had been run through the land of Mr. Chambers, without

any previous agreement as to the price to be paid for the right of way. When Mr. Chambers specified the compensation, the company considered it exorbitant, and Chambers refused to accept that offered by the company. The matter was left to a board of appraisers, who fixed a sum which was unsatisfactory to Chambers, and he appealed from their award to the Superior Court of Floyd County, asking for an injunction restraining the company from using the route through his land. The court having refused the injunction, he appealed to the Supreme Court, which reversed the decision of the court below, on the ground that the company having been organized under the Constitution of the State, which provides that "private property shall not be taken or damaged for public purposes without adequate compensation being first paid," the company had no right to take the property of a citizen for its own use and convenience until it had paid just and adequate compensation.

**PUBLIC SCHOOLS.**—The year 1882 shows a steady growth in the attendance of pupils at the public schools. The aggregate of school population which has been made the basis of apportionment in 1882 was 507,861. The commissioner's estimate is that the enrollment and average attendance will not be less, respectively, than 255,000 and 153,000; and taking these figures, and making the same calculations as in 1881, he gives the figures, 87 cents, \$1.73, and \$2.88, as the approximate appropriation *per capita*, on school population, enrollment, and average attendance, respectively. Thus: in the year 1881 the entire sum furnished for the support of schools was \$363,677.32. Divide this sum by 433,444, the number of children of school age, and the result will be 84 cents as the *per capita* appropriation. If the same sum be divided by 244,197, the number of children that entered the schools during the year, \$1.49 is the appropriation on enrollment; and if the same sum be divided by 149,908, the average attendance, \$2.43 is the appropriation on average attendance. In 1882 the State fund, estimating the poll-tax which is paid in the several counties to the county commissioners as the same as in the previous year, amounts to \$441,114.88. And if the sum raised under local laws in counties and cities prove to be the same, that is, \$134,855.96, the whole sum raised in the State for the support of the public schools will amount to \$575,970.84, or \$77,000 increase as compared with the previous year. This, on the principle of calculation stated above, would give *per capita* on school population, \$1.13; on enrollment, \$2.25, and on average attendance, \$3.76. The sources of the school fund paid out of the Treasury are as follow:

One half rental Western and Atlantic Railroad..	\$150,000 00
Dividend on Georgia Railroad stock.....	1,116 00
Net hire of convicts.....	19,192 20
Fees of inspectors of fertilizers.....	56,198 89
Tax on shovels.....	5,794 76
Tax on liquor-dealers.....	44,767 71
Total.....	\$277,069 86

Brought forward.....	\$277,069 86
Less warrants for expenses.....	4,494 45
Total.....	\$272,574 91
Net proceeds of poll-tax.....	168,839 97
Grand total.....	\$441,114 88

The school law requires that in every county arrangement shall be made for keeping the schools in operation at least three months of the year. This is an essential condition to a right to draw the *pro rata* of the school fund of the State. This was done in every county by the parents of the school-children agreeing to supplement the sum paid by the State, and thus the entire people enjoyed the benefits of the common schools, and every child of suitable age had the advantage of entering and remaining for the term. The School Commissioner strongly recommends that the fund be increased so as to enable the schools to be kept open during six months; that means be furnished to conduct teachers' institutes, and establish at least one normal school. In an enumerated school population—that is, children between the ages of six and eighteen—of 236,319 white and 197,125 colored, making in all 433,444, the number of illiterates between ten and eighteen years is, whites 22,323, colored 63,307; and over eighteen, the number unable to read is, whites 20,839, colored 148,494. Besides the public schools there are 1,080 private elementary schools scattered over the State, with 1,183 instructors, teaching whites 26,822, colored 6,671—total, 33,493 children. Of male and female colleges, including Mercer University (Baptist), and Pio Nono College (Roman Catholic) at Macon, and Emory College (Methodist) at Oxford, and not counting the University of Georgia and its branches, there are eleven institutions of high grades, where upward of 2,000 young men and women are instructed by competent teachers. The Lucy Cobb Institute at Athens, the Wesleyan Female College at Macon, and the La Grange Female College at La Grange, are the most prominent institutions for the higher education of young ladies. The people of Georgia feel deeply grateful to Mr. George I. Seney, of New York, for his munificent donations to Emory College, the Wesleyan Female College, and the Lucy Cobb Institute. The Atlanta University, where colored students exclusively are educated, and for the support of which the State appropriates annually \$8,000—a sum equal to that paid to the University of Georgia in payment of her debt to that institution—is well conducted, and is doing successful work.

At the last General Conference of the Methodist Episcopal Church, South, held in Nashville, Tenn., May, 1882, plans were laid to build, furnish, and provide teachers for a school or college for the education of colored children, teachers, and preachers, the college to be the property of the "Colored Methodist Episcopal Church in America." The plan was formed in response to the appeal of Rev. L. H. Hol-

sey, colored bishop, for help to start an institution for the preparation of colored teachers and preachers. The work is being actively pushed. The college will be situated at Augusta, Ga. Dr. James E. Evans, one of the oldest and most esteemed ministers of the Methodist Episcopal Church, South, has been appointed commissioner, to raise the requisite funds; and Dr. Morgan Callaway, Vice-President of Emory College, has accepted the presidency of the "Paine Institute," as the new college will be called, in honor of Bishop Paine, who, in 1870, organized the "Colored Methodist Episcopal Church in America." Part of the trustees of the institute are white, appointed by the bishops of the Methodist Episcopal Church, South, and part colored, appointed by the colored bishop. This is a remarkable movement, proving that the relations between the whites and blacks are not as unfriendly as many suppose.

**MANUFACTURES, ETC.**—The "New South" has made wonderful progress in manufactures during the past few years, and Georgia is in the lead in this respect. Cotton goods are necessarily the chief manufacture; but iron-foundries, oil-mills, shoe-factories, etc., etc., have sprung up in various parts of the State, and they are all prosperous. The Atlanta Cotton Exposition of 1881 has given a great impetus to manufacturing industry. The principal cotton-factories are situated at Augusta and Columbus, the former using the water-power supplied by the canal, and the latter the water of the Chattahoochee River. The factories now in operation at Augusta are: The Augusta Factory, capital \$1,000,000; consumes annually 13,084 bales of cotton; number of looms, 779; number of spindles, 26,000; producing 15,500,000 yards of goods. The Enterprise Factory, capital \$650,000, consumes 12,000 bales; number of looms, 900; number of spindles, 30,000; producing 13,000,000 yards. The Sibley Mills, capital \$1,000,000, consuming 13,000 bales; number of looms, 800; number of spindles, 30,000; producing 12,000,000 yards. The Summerville Mills, capital \$100,000, consuming 1,500 bales; number of looms, 150; number of spindles, 4,000; producing 2,250,000 yards. The Globe (private enterprise), consuming 2,000 bales; number of spindles, 5,800, producing warps and yarns. Riverside Waste-Works (private), consuming 2,000 bales; number of spindles, 2,400, producing warps and yarns. Sterling Mills (private), consuming 1,000 bales; number of spindles, 2,800, producing warps and yarns; and Goodrich (private), consuming 600 bales; number of spindles, 2,000, producing warps and yarns. The John P. King Mills, in process of construction, and nearly complete, have a capital of \$1,000,000, and will run 750 looms and 25,000 spindles. Total number of looms, 3,379; of spindles, 128,000; of bales of cotton consumed during the year, 57,100. As evidence of the prosperity of these factories it is only necessary to see the profits which

they have divided annually for several years. The Augusta Factory, the oldest and best known, has paid in cash dividends from 1865 to 1882, \$1,467,000, or about two and a half times its capital. Besides this, it has a surplus of between \$340,000 and \$350,000, or over 50 per cent of its capital. Its stock is worth \$170 per share.

The Augusta Crescent and Excelsior Flour Mills manufactured during the year 140,000 barrels of flour, valued at \$1,050,000, and 750,000 bushels of meal, valued at \$637,500. Another large and growing industry at Augusta is the Georgia Chemical Works, with a capital of \$200,000, for the manufacture of fertilizers. They made and sold during the year 15,000 tons, half of which amount was ammoniated and half acid phosphate. None but the highest grades are made by this factory. A factory has been built and is in operation at Kirkwood, near Atlanta, where sulphuric acid is made out of the iron pyrites, thousands of tons of which are scattered over the rocky hills, and at a much less cost than it could be produced from the imported sulphur. In immediate proximity to these works are two fertilizer-factories, a cotton-seed-oil mill, and works for the reduction of copper.

The principal factories at Columbus are: The Eagle and Phoenix Mills, capital \$1,250,000, running 45,710 spindles and 1,600 looms, making 100 varieties of goods; the Columbus Manufacturing Company, capital \$263,000, running 4,156 spindles and 136 looms, making sheetings and domestics; Muscogee Manufacturing Company, capital \$157,000, running 5,000 spindles and 240 looms, making cottonades and domestics; the Steam Cotton Mills, capital \$30,000, running 3,000 spindles, making yarn and thread; the Excelsior Mills, capital \$25,000, running 96 looms, making checks and plaids; and A. Clegg & Co., capital \$10,000, running 48 looms, making checks and stripes. Besides the above, there are at Columbus a jute-factory, turning out 2,000 yards of bagging daily; iron-works, plow-factory, two large flour-mills, a trunk-factory, a clothing-factory, a paper-box factory and a gas-light company, with an aggregate capital of \$2,043,500. There is a cotton-factory at Atlanta, three at Athens, and other small mills in other parts of the State. From the large dividends paid to their stockholders by those that are well managed, and the large sums added annually to the surplus fund, after liberal expenditures for new buildings, machinery, repairs, etc., these industries have proved unusually profitable during the year. A number of cotton-seed-oil mills have been started, or are being built. Broom-factories, works for the manufacture of wooden-ware, ice-factories, carriage and wagon factories, and a number of other industries—some pretentious from large capital, others quite modest—have sprung into existence, making Georgia's claim to be a manufacturing State incontestable.

A good deal is said and written as to the immensely profitable yields of the gold-mines in the northern part of the State. How far these statements are exaggerated, and how far true, can not be ascertained in the absence of disinterested information. The State is said to contain 3,500,000 acres of gold-bearing land, interspersed with land containing 165 different minerals, among the most valuable and useful of which are gold, silver, copper, lead, zinc, iron, coal, mica, asbestos, graphite, marble, limestone, granite, corundum, soapstone, kaolin, clay, marl, gypsum, as well as every species of precious stone, from the diamond to the agate.

The iron industries in Northwestern Georgia have been very prosperous, and their production much increased. The close proximity to the iron-mines of inexhaustible beds of good coal makes the iron industry as profitable as it is. A large number of the Penitentiary convicts are leased to the stockholders, and worked by the mining companies. The report of the Comptroller-General estimates the value of the iron-works in the State in 1882 at \$569,231, an increase of \$219,282, as compared with their value—\$349,949—in 1881. His estimate of the amount of capital invested in mining in 1882 is \$127,622, as compared with \$101,675 in 1881.

The lumber interest has grown immensely during the past year. The exports coastwise from the port of Savannah alone up to August 31st were 57,868,627 feet, and the foreign exports 14,675,279, making a total of 72,043,906 feet. The production of turpentine and naval stores from the immense pine-forests of the southern portion of the State has also increased largely, and is a most profitable industry. The exports from Savannah for the year ending August 31st were: Turpentine, 1,635,250 gallons, worth \$736,593; rosin, 168,408 barrels, worth \$408,418.

**STATE ELECTIONS.**—Elections were held this year throughout the State for Governor, members of the General Assembly, and other State officers, and for members of Congress, including the additional member to which the State is entitled under the late apportionment act of Congress, and who was to be elected by the "State at large," as the General Assembly had not yet defined the limits of the Tenth District.

Unusual popular interest was felt in these elections in consequence of the declared coalition of the Republicans and "Independents," with a view to defeat the organized Democratic party, and thus not only obtain control of the State government, but break the "solid South," by electing anti-Democratic representatives in the Lower House of Congress, and possibly a United States Senator.

The Republicans were not quite harmonious. In their convention, which met in Atlanta, August 2d, one hundred and eighty delegates obeyed the call of W. A. Pledger, colored, the

"Chairman of the State Central Committee" (since appointed collector of customs at Atlanta), and one hundred delegates went into another and antagonistic convention, headed by the white Republicans, or the so-called "Georgia Syndicate," led by General James Longstreet, United States Marshal, and H. P. Farrow, former District Attorney. Both conventions made nominations, but they subsequently agreed to support the opposition to the Democratic candidate, although the differences between the leaders were not adjusted. At one time the contending factions came to blows, and Pledger was arrested and obliged to give bonds for his appearance on a charge of assault and battery.

The Democratic Convention, which met in Atlanta, July 19th, for the purpose of nominating candidates for the offices of Governor, Congressman-at-large, Secretary of State, Treasurer, Comptroller-General, and Attorney-General, having decided by a vote of 194½ to 164½ that a "majority only of the entire vote of this convention (instead of two thirds) shall be necessary to nominate," nominated as follows: For Governor, Hon. A. H. Stephens, of Taliaferro County; for Congressman-at-large, Thomas Hardeman, of Bibb County; Secretary of State, N. C. Barnett, of Baldwin County; Treasurer, D. N. Speer, of Troup County; Comptroller-General, W. A. Wright, of Richmond County; Attorney-General, Clifford Anderson, of Bibb County. A. O. Bacon, the most prominent aspirant for the nomination for Governor, having withdrawn before a ballot, the nomination of Mr. Stephens was practically unanimous, receiving 325 out of 364 votes. The other State officers were nominated by acclamation. For Congressman-at-large, the names of Thomas Hardeman, George Barnes, Henry H. Carlton, and W. H. Dabney were presented. Mr. Hardeman having received 208 votes, his nomination was then made unanimous.

The Independent candidate for Governor, indorsed by the two factions of the Republicans, by the Greenbackers, and by those opposed to the organized Democracy, as well as those who personally disliked Mr. Stephens, was Lucius J. Gartrell, a prominent lawyer of Atlanta, and prior to the war a member of the Federal Congress. After an energetic canvass, during which both candidates made several speeches, at the election in October the people elected Alexander H. Stephens by a majority of 62,357 out of a total vote of 152,949, electing at the same time all the regular Democratic nominees for subordinate State officers, and members of the Senate and House of Representatives of the General Assembly.

The Legislature met on the 1st of November. Hon. James S. Boynton was re-elected President of the Senate, and the Hon. Louis F. Garrard was chosen Speaker of the House of Representatives. The outgoing Governor, Alfred H. Colquitt, in his last message to the Legislature, makes the following cheering statements as

to the material and moral condition of the State:

In transmitting this my final message to the Legislative branch of the State government, in compliance with the requirement of law and custom, I perform the duty with the deepest of gratitude to the Giver of all good, and with elated feelings in view of the state of our beloved Commonwealth. We have never had better reason for congratulation at our present condition or for hopefulness of the future of the State than we claim at this time. In our recent history our retrospect has often been of the saddest, while the prospect had but scanty promise.

The strain to which our powers of endurance and recuperation were subjected was such as to dispirit the most hopeful and resolute, and our deliverance from the ordeal that threatened to overwhelm and destroy us seems to have been achieved by a wisdom above that of man.

Without arrogance or vainglory let us rejoice that under the signal blessing of Providence we are pressing on to take our place abreast of the most advanced states in Christendom, and with an intense love of the arts of peace and a generous emulation of older and more favored commonwealths, we are establishing and diffusing among our citizens the most potent and beneficial agencies and methods for the development of the highest civilization.

We may justly claim for our State that in every department of our industry our people are prospering and advancing. In our agriculture—in our mining operations—in the introduction and multiplication of mechanical establishments—in the wonderful extension of our lumber interests—in the marked improvement in the healthfulness of our State, we find the most substantial grounds for self-gratulation.

And superadded to this cheering summary of material advantage and promise, we may felicitate ourselves upon the general peacefulness and good order which have prevailed throughout the State. With a very few, but unhappily marked, exceptions, the public tranquillity has been undisturbed by outbreaks of violence, and there seems to be a pervading spirit of conciliation which has successfully resisted all unfriendly influences.

Mr. Stephens was inaugurated Governor of Georgia on November 3, 1882. The following is his inaugural address:

GENTLEMEN OF THE GENERAL ASSEMBLY, SENATORS AND REPRESENTATIVES: Having received your official notification of my election to the chief magistracy of the State, I now appear before you, according to a joint resolution of your respective bodies, to take the official oath prescribed by the Constitution.

Before taking this oath and assuming the discharge of the duties of the office thus conferred, in conformity with immemorial custom, it is doubtless expected that I shall present some remarks indicative of the general line of policy which will mark my administration. These views, concisely stated, I shall address not only to you, gentlemen of the General Assembly, but to the large and respected auditory of citizens, comprising ladies and gentlemen, who grace and honor these inaugural ceremonies.

Indulge me, then, fellow-citizens, in saying that, being called to this high office by the voice of the people, I shall enter upon its duties with no feelings of elation, but rather of deep depression, from a profound sense of the weight of responsibility attending this new position. I am entirely untrammelled; I have no promises or pledges to redeem, except faithfully to discharge the duties of the office to the best of my ability; I have no enemies to punish; no personal aims or objects to accomplish; no partisan views to advance; no purpose to promote the schemes or objects of any combination or class of persons whatever; and nothing to serve but the interests of the

people, the whole people of the State. With the co-operation of the legislative department of the government my efforts will be directed with an eye single to the advancement and promotion of the general peace, welfare, and prosperity of our beloved State.

In the administration of the laws, as far as lies in my power, it will be my object to see that equal justice is done to all alike.

All our industrial pursuits, agriculture, manufacturing, mechanical, commercial, mining, shipping, and internal transportation, should be looked after with care. All those institutions, educational, benevolent, and others, which are provided for by our fundamental law, should be fostered and promoted to the extent of legislative ability, with like care and attention. In this way we shall be able to promote and add to the honor and glory and renown of our good old Commonwealth.

As to general measures in practical legislation, I have nothing further to offer than my past public record, in a long and not uneventful life. This is the only guarantee as to the character of my acts in the future.

As to those general political principles by which my administration, Providence permitting, shall be governed, I can but repeat what was said in my acceptance of the nomination tendered me for the office.

I repeat these on this more solemn occasion with an emphasis, and especially because of an evident and growing disposition in many quarters of the country to neglect and ignore them.

These are those essential principles of republican government which lie at the foundation of our whole system of free institutions, and which can be maintained only by being deeply impressed upon the minds of legislators, and all other officials of whatever grade or character, as well as upon the masses of the people, and especially the rising generation.

These are the principles announced by Thomas Jefferson, and adopted by the fathers of the republic early after our complicated system of government was instituted.

These principles apply as well to our Federal system as to the several State governments, and by their maintenance the harmony and success of the system can only be preserved and perpetuated. They are as follows:

"Equal and exact justice to all men of whatever state or persuasion, religious or political."

"The support of the State governments in all their rights, as the most competent administrators of our domestic concerns, and the surest bulwark against anti-republican tendencies; the preservation of the General Government in its whole constitutional vigor, as the sheet-anchor of our peace at home and safety abroad."

"A jealous care of the right of election by the people."

"Absolute acquiescence in the decisions of the majority, the vital principle of republics, from which there is no appeal but to force, the vital principle and immediate parent of despotism."

"The supremacy of the civil over the military authority."

"Economy in the public expense, that labor may be lightly burdened."

"Encouragement of agriculture, and commerce its handmaid."

"Freedom of religion, freedom of the press, freedom of person, under the protection of *habeas corpus*, and trial by juries impartially selected."

"These are some of the principles," said Jefferson, "which constitute the creed of our political faith, the text of civil instruction, the touchstone by which to try the services of those we trust; and should," said he, "we wander from them in moments of error or alarm, let us hasten to retrace our steps, and to regain the road which alone leads to liberty and safety."

These are what constitute the essentials of the creed of Jeffersonian Democracy. They were proclaimed

when there was a strong tendency to abandon the federative feature in the Government, and to merge the State governments into consolidation or centralism, the inevitable end of which would have been empire and despotism.

The object of the founders of the old Republican-Democratic party, at the head of which stood Mr. Jefferson, was to check this tendency of the government, and to preserve that system from which alone springs all hope for the perpetuation of the entire fabric. These principles look as well to the preservation of the Federal Union in its proper sphere as to the maintenance and preservation of the reserved rights of the several States, in their proper spheres, under the Constitution of the United States. This is the true doctrine of home rule on the part of the States under our novel and wonderful system of Federal Union.

There is evidently now, my countrymen, a tendency to centralism as in 1798 and 1799, by the party now in power in the administration of the General Government, bearing the name of Republican.

As Burke upon a memorable occasion appealed "from the new Whig party of England to the old Whigs of his earlier days," so we appeal from modern Republicanism to the ancient creed of our fathers.
